VOLUME XIX.

PRIMATICCIO——RICHARDSON.

LONDON:
CHARLES KNIGHT AND Co., 22, LUDGATE STREET.

MDCCCXLI.

Price Seven Shillings and Sixpence, bound in cloth.

COMMITTEE.

Chairman—The Right Hon LORD BROUGHAM, F.R.S., Member of the National Institute of France.

Vice-Chairman—The Right Hon. EARL SPENCER.

Treasurer—JOHN WOOD, Esq.

William Allen, Esq., F.R. and R.A.S
Chas. Ansell, Esq.
Captain Beaufort, R.N., F.R. and R.A.S.
George Birkbeck, M.D.
George Burrows, M.D.
Peter Stafford Carey, Esq., A.M.
John Conolly, M.D.
William Coulson, Esq.
R. D. Craig, Esq.
J. F. Davis, Esq., F.R.S.
H. T. Dela Beche, Esq., F.R.S.
The Right Hon. Lord Denman.
Samuel Duckworth, Esq.
The Right Rev. the Bishop of Durham, D.D.
Sir Henry Ellis, Prin. Lib. Brit. Mus.
T. F. Ellis, Esq., A.M., F.R.A.S.
John Elliotson, M.D., F.R.S.

THE PENNY CYCLOPÆDIA

OF

THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

PRIMATICCIO, FRANCESCO, was born at Bologna, in 1490. He was of a noble family, and his parents intended to have him brought up to the mercantile profession; but his natural genius leading him to the arts, he learned design and colouring from Innocenzo da Imola and Bagnacavallo, and having manifested extraordinary talent, he went to Mantua to study under Julio Romano, who was engaged on some great works in the palace Del Tè at Mantua, many of which Primaticcio and others of his disciples executed after his designs. Federic, duke of Mantua, recommended him in 1531 to Francis, king of France, who entrusted him with many works. A great jealousy arising between him and Rosso, who was likewise in high favour with Francis, the king sent Primaticcio to Rome to purchase antiques, a commission in which he was extremely successful. He was recalled from Rome to complete a large gallery left unfinished by the death of Rosso. The number of works which he executed in France is truly astonishing, especially in the palace of Fontainebleau, where, assisted by his pupil Nicolo Abate, he painted, besides other works, in the great gallery, which was 450 feet long and 18 wide, fifty-eight pictures, each 6½ feet high and 8 feet wide, representing the principal scenes of the Odyssey; the roof, which was richly adorned with gilding and stucco, was decorated with fifteen large and sixty small pictures, chiefly subjects of heathen mythology. This great work was totally destroyed in 1738, when the great gallery was pulled down to erect apartments for some persons attached to the court. Francis II. gave him the abbey of St. Martin de Troyes, with a revenue of 8000 crowns, which he enjoyed till his death in 1570. Primaticcio's talents however were chiefly called into exercise under Henry II., most of the frescoes with which Francis intended to adorn Fontainebleau not being executed till after his death. The oil-paintings of Primaticcio are excessively rare in Italy. Fuseli mentions a Concert of three female figures in the Zambeccari gallery as an enchanting performance; and Dr. Waagen says that a picture at Castle Howard representing Penelope relating to Ulysses what has passed in his absence, is the finest work of this master that he had yet seen.

PRIME. A number is said to be prime when it is not divisible without remainder by any less number than itself, except unity. Thus 1, 2, 3, are of necessity prime; 4 is not, being divisible by 2; 5 is prime, and so are 7, 11, 13, 17, 19, 23, 29, 31, &c.

Large lists of prime numbers have been published [TABLES], but they are seldom possessed by the elementary student. As it is however frequently desirable to know whether a number not exceeding 10,000 is prime or not, we shall give a table to that extent, the manner of using which is as follows:—If we wish to know whether 2357 be a prime number, under the heading 2 and in the column 3 we look for 57, which we find there; whence the table shows that 2357 is a prime number. Again, by the same means we find that 1437 is not a prime number, the adjacent prime numbers being 1433 and 1439.

The distribution of the prime numbers does not follow any discoverable law, but it begins to be evident from the preceding table, that in a given interval the number of primes is generally less, the higher the beginning of the interval is taken. The following table will set this in a clearer light: the numbers in the first column mean thousands, and in the second column are found the numbers of primes which lie in the interval specified in the first column. Thus between 10 thousand and 20 thousand lie 1033 primes.

Between	No. of Primes.	Between	No. of Primes.
0 and 10	1230	150 and 200	4135
10 and 20	1033	200 and 250	4061
20 and 30	983	250 and 300	3943
30 and 40	958	300 and 350	3989
40 and 50	930	350 and 400	3884
50 and 60	924	400 and 500	7677
60 and 70	878	500 and 600	7555
70 and 80	901	600 and 700	7442
80 and 90	876	700 and 800	7402
90 and 100	879	800 and 900	7331
100 and 150	4257	900 and 1000	7225

In the first 10,000 numbers, upwards of 12 per cent. are primes; but between 900 thousand and a million, only 7½ per cent. are primes. The preceding enumerations are taken from Legendre's Theory of Numbers, and were made from the large tables of primes given by Vega, Chernac, and Burkhardt. The only thing known relative to the proportions of prime numbers to others is that if x be a very large number, the number of primes contained between 0 and x is nearly $x \div (\log x - 1{\cdot}08366)$, $\log x$ being the Naperean logarithm. This very curious theorem was discovered empirically, that is, by looking for a formula which should nearly represent the results of tables. Legendre, in the work cited, gave proof that such a formula must have the form $x \div (A \log x - B)$, but no reason has yet been given why A is 1, and B is 1·08366. Using the common logarithm, we find that the number of primes less than x is such a proportion of x as ·4342945 is of $\log x$ − ·470628, nearly. Thus, of all numbers less than a million of million of millions, only one out of 40 is prime, while the number of primes under the square of that number is one out of 82.

It thus appears that we might name a succession of numbers beginning with one so high, that a million, or any other number however great, of numbers should pass without containing one prime number. Nevertheless there cannot be an end to the prime numbers; for if so, let p be the last prime number, and let N be the product of all the numbers 2, 3, 5, ..., p. Now every number is either prime or divisible by a prime; but N + 1 is not divisible by 2, 3, 5, ... or p, since it leaves a remainder 1 in every such division. It is therefore prime, or there is a prime number N + 1, greater than the greatest prime number p, which is absurd. The following are among the properties of prime numbers. (1.) Every prime number (except 2) is odd, or of the form $2x + 1$. (2.) Every prime is of the form $4x + 1$ or $4x + 3$, and a prime of the form $4x + 1$ is always the sum of two squares. (3.) Every prime is of the form $6x + 1$ or $6x + 5$. (4.) No algebraical formula can always represent a prime number; but some formulæ show a long succession of primes: thus $x^2 + x + 41$ is prime from $x = 0$ to $x = 39$, both inclusive. (5.) If $2x + 1$ be a prime number, and N any number which it does not divide, either $N^x - 1$ or $N^x + 1$ must be divisible by $2x + 1$. (6.) If M and N be two prime numbers, and if $M = 2x + 1$, $N = 2y + 1$, then if x and y be both odd numbers, either $(M^y - 1) : N$ and $(N^x - 1) : M$ are both whole numbers, or $(M^y + 1) : N$ and $(N^x + 1) : M$ are both whole numbers. But if x and y be not both odd, then either $(M^y - 1) : N$ and $(N^x + 1) : M$ are both whole numbers, or else $(M^y + 1) : N$ and $(N^x - 1) : M$ are both whole numbers. This theorem is of considerable importance in the theory of numbers, and has been termed the law of reciprocity of prime numbers.

Two numbers are said to be prime to one another, when they have not any common measure except unity: as 36 and 55.

The prime factors of a number are those prime numbers which divide it. Thus 360 being $2^3 \times 3^2 \times 5$, its prime factors are 2, 3, 5, of which the first enters three times, the second twice, and the third once. If A, B, C, ... be the prime factors of a number, and a, b, c, ... the number of times which they severally enter, the number is $A^a \times B^b \times C^c \times \ldots\ldots$, and the number of divisors which it admits of (unity and itself included) is $(a+1) \times (b+1) \times (c+1) \times \ldots\ldots$ Call this number N: then the number of numbers less than N, and prime to N, is

$$N \times \frac{a-1}{a} \times \frac{b-1}{b} \times \frac{c-1}{c} \times \ldots\ldots$$

PRIME AND ULTIMATE RATIOS. [RATIOS, PRIME AND ULTIMATE; DIFFERENTIAL CALCULUS.]

PRIME'RO, a game at cards, so called from a situation in the game. He who holds the *prime* (primero), that is, a sequence of the best cards and a good trump, is sure to be successful over his adversaries; hence its denomination *Primero*, *Prime*, and *Primavista* were one and the same game.

Primero appears to have been one of the earliest games at cards played in England, and continued to be the most fashionable game throughout the reigns of Henry VIII., Edward VI., Mary, Elizabeth, and James. In the earl of Northumberland's letters relating to the powder-plot, we find that Josceline Percy was playing at primero on Sunday, when his uncle, the conspirator, called on him at Essex-house. In the Sydney Papers there is an account of a quarrel between Lord Southampton, the patron of Shakspere, and one Ambrose Willoughby, on account of the former persisting to play at primero with Sir Walter Raleigh and another, in the Presence Chamber, after the queen had retired to rest.

Shakspere speaks of Henry VIII. playing at primero with the duke of Suffolk.

One of the dialogues at the end of Minshew's Spanish Dictionary illustrates the method of playing this game; many of the terms of which are also detailed in one of Sir John Harington's epigrams, in which he describes 'the Story of Marcus's Life at Primero.'

It is uncertain whether this game is of Spanish or Italian origin. Daines Barrington and Mr. Bowle (*Archæologia*, vol. viii., 133-151) were of opinion that it is of Spanish origin; but Berni's *Capitolo del Gioco della Primeira* affords proof that it was at least commonly played in Italy at the commencement of the sixteenth century.

(Nares's *Glossary*; Singer's *Researches into the History of Playing Cards*, 4to., Lond., 1816, p. 244-256.)

PRI'MNOA, a subdivision of the Linnæan genus Gorgonia.

PRIMOGENITURE may be defined to be that rule of law by which a title of dignity or an estate in land comes to a person in respect of his being an eldest male. If a man dies seised of real estate, of which he had the absolute ownership, without having made any disposition of it by his last will, the whole descends to the heir at law or customary heir; and the heir at law is such by virtue of being the eldest male person of those who are in the same degree of kindred to the person dying, or the representative of such eldest male. [DESCENT.] This is a case in which primogeniture operates. A common example of primogeniture is where a father dies absolutely entitled to real estate, and without disposing of it by will, in which case his eldest son takes it all. If land is settled or entailed on a man and his male issue, the eldest son takes the land by two titles, first as being a male, and then as being the eldest son. The law of primogeniture then only applies in the case of land when the owner dies without having made any disposition of it by will, or where the land is settled on a man and his male issue. It does not apply where the interest in land is a chattel interest, as a term of years, whatever may be its duration.

At present, those who are the absolute owners of large landed estates seldom die without making a disposition of them by will. In the case of lands which are settled, the person in possession is generally tenant for life, and the inheritance is entailed on the eldest son. When the eldest son is about to marry, it is usual for the father and son to take the usual legal steps which they can do as soon as the son is of age to unsettle the estate and obtain the absolute ownership. They then resettle the estate, making the father tenant for life as before; the son, who was before tenant in tail, is also made only a tenant for life; and the inheritance is entailed, as before, on the eldest son of the intended marriage. Such eldest son takes the estate, not as heir, and therefore not by the law of primogeniture, but he takes it as the person designated by the deed of settlement.

When a man happens to be tenant in tail, he usually takes the legal steps necessary (which he can do as soon as he is of age) to acquire the absolute ownership of the property, which he then generally settles again by deed or will, or disposes of absolutely.

It is usual in England to settle all large estates, and the object of the settlement is to keep the estates together, and to perpetuate them in one family; but there is a limit to this power of settlement. A man cannot, either by deed or will, settle his land, so as to prevent the absolute ownership of it from being obtained, for a longer period than a life or lives of persons in existence at the time when the settlement takes effect, and twenty-one years more.

Lands in GAVELKIND and BOROUGH ENGLISH are an exception to the general rule of law as to the descent of land.

The law of primogeniture then only operates in the cases already explained; and the system of settlements by which property is kept together in large masses is quite distinct in principle from the law of primogeniture. It is not the result of a law which favours primogeniture, but it is the result of the legal power which an owner of land has over it, and of the habits of the people. The various reasons which have laid the foundation of this habit, and which perpetuate it, are foreign to the consideration of primogeniture as a rule of law.

In Virginia, after the Revolution, an act was passed for converting estates tail into fee simple, and at the same time the law of primogeniture was abolished. These laws have so far been in accordance with, or have acted on public opinion, that a parent by his will now generally makes the same disposition of his property as the law makes in case he dies intestate. (Tucker's *Life of Jefferson*, i. 96, &c.)

(*Remarks on Primogeniture and Entails*, Hayes, *Introduction to Conveyancing*.)

PRIMULACEÆ are monopetalous Exogenous plants, peculiarly distinguished by the stamens being opposite to the lobes of the corolla, and a superior capsule with a free central placenta. In most respects they correspond indeed with the Myrsinaceous order, but the latter are known by their being trees or shrubs with an indehiscent fleshy fruit. The Primulaceous order consists of herbaceous plants inhabiting the temperate parts of the world, in moist situations, such as meadows, marshes, and alpine stations, or in the damp parts of woods, which they adorn with their lovely flowers. The Primula, Anagallis, Soldanella, Cyclamen, and Lysimachia, of various species and under many forms, are the gayest of the genera, some of whose species are found in almost all gardens. The scentip is slightly narcotic, but the order is of no known utility.

Primula veris.

1, a corolla laid open; 2, a section of a capsule; 3, a section of a seed.

PRIMUM MO'BILE, the name given in the old astronomy to the imaginary sphere by the motion of which diurnal motion was given to the heavens. [PTOLEMAIC SYSTEM.]

PRINCE is the Latin word *princeps*, which was originally used to denote the person who was entitled princeps senatus in the Roman State. He seems to have been originally the custos of the city, and his office was one of importance. Subsequently it became a title of dignity, and the princeps was named by the censors. (Liv., xxvii. 11.) In the senate he gave his opinion first after the magistrates. Augustus and his successors adopted the title of princeps, as a name that carried no odium with it; and this became henceforward the characteristic title of the master of the Roman world. Accordingly the constitutions of the emperors are called principum (Gaius, i. 2), or principales. The word princeps is formed similarly to auceps, municeps, &c., and contains the same element as 'primus.' In the course of time the word prince, which is derived from princeps, has come to be applied to persons having personal preeminence, and especially to certain sovereigns of smaller states possessing either perfect independence of all others or enjoying under some superior high political rights. Of the first kind were the old sovereigns of Wales, who, under the name of princes, enjoyed the same right and power which belong to kings; and of the second, the heads of certain states of Germany comprehended in the great Germanic confederation. But the word seems not to have acquired so definite a sense as that which belongs to king, duke, marquis, earl, and some others of the class; but rather to denote persons of eminent rank in certain states, as in Prussia, Russia, Italy, and other continental states, where no sovereignty, properly so called, comes along with it, or persons who are junior members of sovereign houses, as Prince Leopold, Prince Albert, both younger members of one branch of the sovereign house of Saxe.

In England it has sometimes been the practice of the heralds to speak of a duke as the high and mighty prince; but the word seems rather to be restricted among us in its application to persons who are of the blood-royal, that is, a son, grandson, or nephew of a king; and it would probably be extended to the remote male posterity, though no such case has arisen in the course of the last three centuries; and in its application it is merely a term of common parlance, not being conferred, like the title of duke, in any formal manner; and even the precedence which is given to blood-royal has respect to birth, and not to the enjoyment of this word as a title of honour. The king's eldest son is however made Prince of Wales by a special act of creation.

PRINCE EDWARD'S ISLAND, a British island on the coast of North America, in the Gulf of St. Lawrence, is situated between 45° 58′ and 47° 7′ N. lat. and between 62° and 64° 27′ W. long. It extends from east to west in a somewhat curved line 135 miles in length. The width varies between 34 miles and one mile. The surface is calculated to comprehend an area of 2157 square miles, or 1,380,480 acres: it is about 45 square miles larger than the North Riding of Yorkshire. It is separated from Nova Scotia and New Brunswick by Northumberland Strait, which in the narrowest part is hardly more than ten miles wide.

The coast is so intersected by bays and creeks, that there is hardly a place which is more than eight miles from the shore. These bays and inlets form good harbours, and the larger ones contain several branches which have good anchorage. Only at the western extremity, between North Cape and West Cape, and again along the northern coast towards the eastern extremity, between St. Peter's Bay and East Cape, there is no harbour. The most remarkable of these bays is Hillsboro Bay, which enters the island from the south with a broad opening, but afterwards becomes so narrow that it appears like a river, and is accordingly called Hillsboro River: the tide ascends nearly to its extremity, 20 miles above Charlotte Town. Farther west are Halifax Bay and Richmond Bay, of which the former intersects the country from the south and the latter from the north, so as to leave between them only an isthmus one mile wide. Richmond Bay stretches ten miles from its entrance inland, and is nine miles wide, but the entrance is contracted by a long narrow island lying across it.

The surface of the island consists of gentle ascents and descents. There is no plain of any extent, and the eminences do not deserve the name of hills, with the exception perhaps of a series of heights which intersect the island nearly in the middle, running from Disable Bay on the southern shores, to Grenville Bay on the north. The soil, though nowhere very fertile, is in general productive. There are a few swamps, some of which are dry and covered with shrubs and moss; others are wet, and produce dwarf alder, long grass, and a variety of shrubs. There are also barren tracts which produce nothing except dry moss or shrubs. But the swamps and barrens bear only a small proportion to the whole surface of the island.

The climate of Prince Edward's Island is favourably distinguished from that of all the surrounding countries by being exempted from fogs and being much less subject to cold. A misty fog appears sometimes on a summer or autumnal morning, but it is soon dispersed. The winter is two months shorter than in Nova Scotia and New Brunswick, and the frost much less intense; snow however falls in considerable quantity. For three or four months the country is covered with it. In April spring begins, but the heat increases rapidly, and summer may be considered as beginning in May. In June, July, and August the heat is excessive, the thermometer commonly rising to 80° or 90°, and during this period thunder-storms are frequent. From September to November the season is pleasant, and in December the frost sets in.

With the exception of the swamps and barrens, the island was formerly entirely overgrown with high forest-trees, especially pine, the timber of which has been so largely exported to England, that at present there is no more than is required by the inhabitants for house and ship building and other purposes. The other trees are spruce-fir, hemlock, beech, birch, maple, poplar, and white cedar in abundance; oak, elm, ash, and larch are not plentiful, and the quality of the first is very inferior. At present about one half of the cultivable surface of the island is still wooded.

Soil and climate unite to make this island an agricultural country. All kinds of grain and vegetables raised in England grow very well. Wheat, barley, and oats are extensively grown; and some winter-rye and buckwheat. Beans and peas are also raised. All the culinary vegetables common in England attain perfection. Indian-corn does not succeed well. Flax is raised only for home consumption, and is of excellent quality; hemp does not thrive well. The fruits are cherries, plums, damsons, and black, red, and white currants. Apples and pears require great attention, and are of inferior quality.

The horses are small but hardy. The black cattle are of a smaller size than in England. Sheep and swine are plentiful, and the breed of the former has lately been much improved. The wild animals are bears, loup-cerviers, foxes, hares, otters, martens, musquashes, minks, squirrels, musk-rats, and weasels. The bears, which formerly destroyed a great number of cattle, sheep, and hogs, have been nearly -minated. Otters, martens, and musk-rats, which supply valuable furs, have become scarce. Seals are found in the bays and along the shores in summer and autumn; and in summer immense numbers sometimes come down on the ice from the northward. Among the birds, the partridges are distinguished by their size, and wild pigeons are numerous, but only appear in summer. Wild geese make a stay of about six weeks in spring, and about as long in autumn. Fish as well as shell-fish are plentiful, and the oysters are considered the finest in America. Many cargoes are annually sent to Quebec and Halifax.

No minerals have been found on the island except red and white clay, fit for bricks and pottery.

The island is divided into three counties, King's County, Queen's County, and Prince's County. Queen's County occupies the central districts, King's County the east, and Prince's County comprehends the west. Queen's County contains 771 square miles, and is nearly equal to Nottinghamshire; King's County contains 650 square miles, and is not so large as Worcestershire; Prince's County has 736 square miles, or almost as many as Oxfordshire. The population chiefly consists of Scotch emigrants and their descendants, some families of English extraction, and a few Acadians, or Americans of French origin. Formerly there were several families of Micmac Indians, but it appears that they have all emigrated to Chaleurs Bay. In 1768 the number of families did not exceed 150. According to the census taken in 1827, the population consisted of about 36,000, and as the number of settlements was then rapidly increasing, Bouchette estimated the population, in 1832, at 50,000.

The settlements are dispersed all over the island. The coasts are more densely settled than the interior, with the exception of the western coast between North Cape and East Cape, which is almost entirely in its natural state, and is overgrown with forests. The northern coast has a greater number of settlements than the southern. Charlotte Town, the capital and seat of government, is situated in Queen's County, on the north side of Hillsboro River, near its confluence with the rivers Elliot and York. The harbour is considered one of the best in the Gulf of St. Lawrence. At the entrance it is little more than half a mile wide, but within it enlarges and forms a safe and spacious basin, which branches off into three beautiful and navigable rivers. The town stands on a gently rising ground, and is regularly built with broad streets intersecting each other at right angles. There is a court-house, an Episcopal church, a Scotch church, and a Roman Catholic and a Methodist chapel. In 1830 it contained about 350 dwelling-houses and 3400 inhabitants. In three or four places on the eastern and northern coast timber is shipped for England.

Ship-building is carried on in this island, and a considerable number of vessels, from one hundred to six hundred tons, are built for the British market: but the principal trade of the island consists in supplying Newfoundland with schooners for the seal and cod fisheries, with black cattle, sheep, hogs, poultry, oats, potatoes, turnips, &c.; the returns are chiefly made in money or West India produce. Wheat and other grain are sent to Miramichi and other settlements on the eastern coast of New Brunswick, where the population are chiefly engaged in preparing timber for the market. The same articles are sent to Halifax. Beef, pork, sheep, hams, cheese, oats, potatoes, flour, and fish are occasionally exported to Bermuda. Though the best fishing-banks within the Gulf of St. Lawrence lie in the immediate vicinity of the northern shores of this island, fishing is not carried on to any great extent.

Prince Edward's Island was discovered by Cabot in 1497, on St. John's day, and hence it obtained the name of St. John's Island, which it preserved up to 1799, when it was changed into its present name in honour of the late duke of Kent. It was taken possession of by the French after the settlement of Canada, but no permanent establishment seems to have been formed in it before the peace of Utrecht (1713), when some families from Cape Breton settled there. In 1758 it was taken by the English, who retained possession of it at the peace of Paris (1763). In 1770 a separate constitution was granted to it, and the first House of Assembly met in 1773.

Prince Edward's Island is in the diocese of Nova Scotia. There are two schools supported by the government in Charlotte Town; and there are also schools for elementary instruction in most of the settlements. The government is conducted by a lieutenant-governor and a council, which also acts in a legislative capacity, and there is a House of Assembly, which consists of eighteen members. The English law is administered by a chief-justice, and there are district courts for the recovery of small debts.

(Macgregor's *British America*; Bouchette's *British Dominions in North America*.)

PRINCE WILLIAM'S SOUND is a wide bay on the north-west coast of North America, extending, with several branches, between 59° and 61° N. lat. and between 145° and 148° 30′ W. long. It is called by the Russians Tchugatsh-koi. It opens to the south, and the entrance contains two large islands, of which the eastern is called Rose Island, and the western Montague Island. In both islands there are good harbours, and the largest vessels may enter the bay on both sides of Montague Island. Rose Island contains Port Etches, where the Russians have a factory, and a wooden fort, called Fort Constantine. The islands are rocky and mountainous, but the mountains do not rise so high as on the continent. The country abounds in pine-trees, some of which are very large; there is also a great quantity of alder and hazel trees. Wild berries, as strawberries, raspberries, and elderberries, are plentiful. Sea-otters and foxes are still frequently met with, and other fur-bearing animals are abundant in the forests. The natives, who are few in number, and called Ougalakhmutes, live mostly on the produce of their fishing. They are short in stature, and seem to be a cross between the Esquimaux and the other Indians. (Portlock's *Voyage Round the World*.)

PRINCE OF WALES'S ISLAND. [PENANG.]

PRINCE'S METAL, or *Prince Rupert's Metal*, an alloy of copper and zinc, which contains more copper than brass does, and is prepared by adding this metal to the alloy.

PRINCIPAL, the name of a stop or row of metal pipes in an organ, tuned an octave higher than the diapason, an octave lower than the fifteenth, and serving to blend the two, as well as to augment the volume of sound.

PRINCIPAL. [AGENT.]

PRINCIPATO CITRA. [SALERNO, Province.]

PRINCIPATO ULTRA, called also 'Provincia di Avellino,' is a province of the kingdom of Naples, bounded on the north by the provinces of Sannio and Capitanata, from which it is divided by the central ridge of the Apennines, on the east by Capitanata, on the south by Basilicata and the province of Salerno, and on the west by Terra di Lavoro. The province of Principato Ultra lies almost entirely in the Apennines, and between the western lower ridge of those mountains, including Monte Taburno, Tifata, and Monte Vergine, which divides the basin of the river Calore, an affluent of the Volturno, from the plains of Campania, and the central ridge, which forms the watershed between the streams that flow into the Mediterranean and into the Adriatic. The Calore and its affluents the Tammaro and Sabbato are the principal rivers of the province. A small part of Principato Ultra however extends along the eastern slope of the central ridge, where the river Ofanto (Aufidus) has its source in the neighbourhood of Conza and Nusco.

Owing to the local situation of the province and its elevation above the sea, the temperature is considerably lower upon the whole than that of the plains of Campania, although in some of the valleys the summer heats are occasionally very great. Some places in the valley of the Calore are subject to the malaria in consequence of stagnant waters. The country produces corn, fruits in abundance, silk, some wine, and has excellent pasture for cattle. By the last census the population of the whole province was 390,000, exclusive of Benevento and its territory, which belongs to the pope, although geographically included within the boundaries of Principato Ultra. [BENEVENTO.] The area is reckoned at 1300 square miles. (Neigebaur; Serristori.) The principal towns of the province are, Avellino, Ariano, Montemarano, with 6000 inhabitants, Montefusco, with 3000, and Sant' Angelo dei Lombardi. The province is divided, for administrative purposes, into three districts:—Avellino, Ariano, and Montefusco.

The province of Principato Ultra occupies the country of the ancient Hirpini, one of the nations of the Samnite confederation.

PRINCIPIA, the contracted title of the 'Philosophiæ Naturalis Principia Mathematica,' the great work of Newton, the publication of which is the most remarkable epoch in the history of science. The title-page of the first edition is: '*Philosophiæ Naturalis Principia Mathematica. Autore Is. Newton, Trin. Coll. Cantab. Soc. Matheseos Professore Lucasiano, et Societatis Regalis Sodali. Imprimatur. S. Pepys, Reg. Soc. Præses. Julii 5, 1686. Londini, Jussu Societatis Regiæ ac Typis Josephi Streater. Prostat apud plures Bibliopolas. Anno MDCLXXXVII.*'

The object of this article is to describe the publication and the contents of the Principia, with a brief notice of the principal commentaries. The first head, the publication, we should have left untouched, referring to the article NEWTON, if it had not been for the work which the late Professor Rigaud published a short time before his death, entitled 'Historical Essay on the First Publication of Sir Isaac Newton's Principia,' Oxford, 1838. A slight account of this publication, embodying Mr. Rigaud's conclusions, may be usefully appended to the article cited.

Mr. Rigaud appears to receive the common story of the *fall of an apple*. [NEWTON, p. 201.] It was communicated by Newton's niece to Voltaire, and by her husband, Mr. Conduit, to Fontenelle. It is clear however that Newton first thought on the subject in 1666. With reference to the story of his laying by the theory until *Picard's measure* of the earth was brought to his notice in 1682 [p. 199], Mr. R. states the fact that Picard's '*Mésure de la Terre*' was published in 1671, and much discussed at the Royal Society in the years following.* Moreover Dr. Pemberton, who derived his information from Newton himself, states most explicitly (in his preface) that a letter from Hooke gave occasion to his resuming his old thoughts, and that he then used Picard's measure. This letter from Hooke, the subject of which was the curve in which a falling body descends to the earth, taking into account the earth's motion, is clearly made out to have been written in 1679, which is therefore the date of Newton's resumption of his attempt, not 1682, as generally stated. The new attempt, as every one knows, was more successful; but Newton did not write any treatise nor contemplate any publication; he traced out the foundation of his system, and threw aside his papers. In January,† 1684, Halley had concluded, from Kepler's third law, that the centripetal force on the planets (supposed to move in *circles*) was as the inverse square of the distance. Not being able to proceed further, he applied to Hooke and Wren, the former of whom professed to have solved the whole problem, but would communicate nothing; the latter declared that he had long given over the question from inability to succeed. In August following, Halley paid a visit to Newton at Cambridge, who informed him that he had solved the problem, but *was not able to lay his hand on the papers which contained his solution*, so completely had he thrown the subject aside. After Halley's departure, he worked the theorems out again, and transmitted them to Halley through Mr. Paget, the mathematical master at Christ's Hospital. On receipt of this communication, in November, Halley immediately paid another visit to Cambridge, to gain more information, and to induce Newton to pursue the inquiry. December 10, 1684, Halley stated at the Royal Society that 'he had lately seen Mr. Newton at Cambridge, and that he had shown him a curious treatise *De Motu*, which, upon his desire, he said was promised to be sent to the Society to be entered upon their register.' Halley and Paget were accordingly deputed to keep Newton in mind of his promise (a singular proceeding, showing how well the Society knew Newton's indifference about communicating), and the consequence was, that about the middle of February, 1685, a communication (that previously made to Halley, enlarged), entitled 'Isaaci Newtoni Propositiones de Motu,' was sent and registered: it contains what were afterwards the main theorems of the early sections of the Principia, direct and inverse, relating to centripetal forces. No Principia as yet existed, and even this basis had only recently been written down satisfactorily. Newton writes to Mr. Aston, Sec. R. S., in acknowledging the news of the above entry, 'I designed them for you before now, but the examining several things has taken a greater part of my time than I expected, and a great deal of it to no purpose. And now I am to go into Lincolnshire for a month or six weeks. *Afterwards I intend to finish it* as soon as I can conveniently.' (February 23, 1685.) On this Mr. Rigaud well

* Mr. R. mentions that Newton must have been acquainted with the measures of Snell and Norwood, the result of the former of which appears in his own edition of Varenius. [illegible] It may be [illegible] that he had not much to do with the details of it.

† That is, what we call 1684; Halley writes 1683-4. [illegible] All the following dates are for a year beginning in January.

remarks, 'The Principia was not a protracted compilation from memoranda which might have been written down under the impression of different trains of thought: it had the incalculable advantage of being composed by one continued effort, during which the mutual bearing of the several parts was vividly present to the author's mind.' On the 21st of April, 1686, Halley announced to the Royal Society that Mr. Newton 'had an incomparable Treatise on Motion almost ready for the press;' and on the 28th of the same month Dr. Vincent* presented the manuscript of the first book to the Society, who referred the question of printing to the Council, and the production of a report upon the contents to Halley. May 19, the Society decided that the work should be printed forthwith in quarto, &c.; and hence it has always been supposed that the Society paid the expenses of printing, though the title-page only bears 'jussu Societatis,' &c., and not 'jussu et sumptibus,' as usual where it bore the expenses. But Mr. Rigaud quotes the minute of the *Council* of the Society of the 2nd of June, confirming the vote of the *Society* to the extent of resolving 'that Mr. Newton's book be printed,' but adding that 'E. Halley shall undertake the business of looking after it, *and printing it at his own charge, which he engaged to do.*' The fact was, that when the Council came to consider the Society's vote of the 19th of May, they found there was no money; a work of Francis Willughby, 'De Historia Piscium,' published 'jussu et sumptibus,' in 1686, had so reduced their funds, that they were obliged to pay their officers in copies of this very book about fishes.

In the meanwhile arose a controversy with Hooke, the universal claimant, who, when the first part of the manuscript was presented by Vincent, asserted that he had discovered the law of the inverse squares, and had communicated that and other discoveries to Newton. The heads of the paper on which he founds his claim are given at length in HOOKE, ROBERT, and they show that though he had (in common with several others) some very correct notions on the subject, he had not even arrived at the knowledge of the law of the inverse squares, though that had been propounded by BOUILLAUD. Mr. Rigaud enters at great length into this question; if we were to do the same, we should take an advanced position, and before we attempted to show that Hooke did not write any part of the substance of the Principia, we should require reasonable proof that he would have been able to read and understand the mathematical part of it when written: and not until this had been given, which we are convinced could not be given from Hooke's writings, should we consider it necessary to enter on the first point. Had it not been for Halley, this trumpery claim of Hooke's would have produced serious consequences. Newton, easily disgusted by controversy, and having observed that physical questions generally gave rise to it, proposed (in a letter to Halley, June 20, 1686) to omit the third book altogether, which contains the actual application of the first two books to the existing universe. He says, 'The third I now design to suppress. Philosophy is such an impertinently litigious lady, that a man had as good be engaged in lawsuits as have to do with her. I found it so formerly, and now I have no sooner come near her again, but she gives me warning. The two first books, without the third, will not so well bear the title of "Philosophiæ Naturalis Principia Mathematica," and therefore I had altered it to this,—"De Motu Corporum Libri Duo," but upon second thoughts, I retain the former title. 'Twill help the sale of the work, which I ought not to diminish now 'tis yours.' Halley had to soothe this irritation, and prevent the consequences; and as the letter in which he did this is very curious, and has never been printed altogether, except by Mr. Rigaud, the surpassing interest which everything connected with the Principia excites will justify our giving it entire, particularly as it is the original voucher for several of the most important circumstances connected with the publication:—

'London, 29 June, 1686.

'Sir,—I am heartily sorry that in this matter, wherein all mankind ought to acknowledge their obligations to you, you should meet with anything that should give you disquiet; or that any disgust should make you think of desisting in your pretensions to a lady whose favours you have so much reason to boast of. 'Tis not she, but your rivals, envying your happiness, that endeavour to disturb your quiet enjoyment; which, when you consider, I hope you will see cause to alter your resolution of suppressing your third book, there being nothing which you can have compiled therein, which the learned world will not be concerned to have concealed. Those gentlemen of the Society to whom I have communicated it, are very much troubled at it, and that this unlucky business should have happened to give trouble, having a just sentiment of the author thereof. According to your desire in your former, I waited upon Sir Christopher Wren, to inquire of him, if he had the first notion of the reciprocal duplicate proportion from Mr. Hooke. His answer was, that he himself very many years since had had his thoughts upon the making out the planets' motions by a composition of a descent towards the sun, and an impressed motion; but that at length he gave it over, not finding the means of doing it. Since which time Mr. Hooke had frequently told him, that he had done it, and attempted to make it out to him; but that he never was satisfied that his demonstrations were cogent. And this I know to be true, that in January, 1683-4, I, having, from the considerations of the sesquialter proportion of Kepler, concluded that the centripetal force decreased in the proportion of the squares of the distances reciprocally, came on Wednesday to town, where I met with Sir Christopher Wren and Mr. Hooke, and falling in discourse about it, Mr. Hooke affirmed, that upon that principle all the laws of the celestial motions were to be demonstrated, and that he himself had done it. I declared the ill-success of my own attempts; and Sir Christopher, to encourage the inquiry, said that he would give Mr. Hooke, or me, two months' time to bring him a convincing demonstration thereof; and, besides the honour, he of us, that did it, should have from him a present of a book of forty shillings. Mr. Hooke then said, that he had it, but he would conceal it for some time, that others trying and failing might know how to value it, when he should make it public. However, I remember that Sir Christopher was little satisfied that he could do it; and though Mr. Hooke then promised to show it him, I do not find that in that particular he has been so good as his word. The August following, when I did myself the honour to visit you, I then learnt the good news that you had brought this demonstration to perfection: and you were pleased to promise me a copy thereof, which the November following I received with a great deal of satisfaction from Mr. Paget; and thereupon took another journey to Cambridge, on purpose to confer with you about it, since which time it has been entered upon the Register Books of the Society. As all this passed, Mr. Hooke was acquainted with it, and according to the philosophically ambitious temper he is of, he would, had he been master of a like demonstration, no longer have concealed it, the reason he told Sir Christopher and me now ceasing. But now, he says, this is but one small part of an excellent system of nature, which he has conceived, but has not yet completely made out, so that he thinks not fit to publish one part without the other. But I have plainly told him, that unless he produce another differing demonstration, and let the world judge of it, neither I nor any one else can believe it. As to the manner of Mr. Hooke's claiming the discovery, I fear it has been represented in worse colours than it ought; for he neither made public application to the Society for justice, nor pretended you had all from him. The truth is this: Sir John Hoskyns, his particular friend, being in the chair when Dr. Vincent presented your book, the Doctor gave it its just encomium both as to the novelty and dignity of the subject. It was replied by another gentleman, that you had carried the thing so far, that there was no more to be added. To which the Vice-president replied, that it was so much the more to be prized, for that it was both invented and perfected at the same time This gave Mr. Hooke offence, that Sir John did not, at that time, make mention of what he had, as he said, discovered to him; upon which they two, who till then were the most inseparable cronies, have since scarce seen one another, and are utterly fallen out. After the breaking up of that meeting, being adjourned to the coffee-house, Mr. Hooke did there endeavour to gain belief, that he had some such thing by him, and that he gave you the first hint of this invention. But I found, that they were all of opinion, that, nothing thereof appearing in print, nor on the books of the Society, you ought to be considered as the inventor. And if in truth he knew it before you, he ought not to blame any but himself, for having taken no more

* This gentleman is supposed to have been the husband of a lady to whom Newton was attached in early life.

tion he pretends a discovery which he puts so much value on. What application he has made in private, I know not; but I am sure that the Society have a very great satisfaction in the honour you do them, by the dedication of so worthy a treatise. Sir, I must now again beg you, not to let your resentments run so high, as to deprive us of your third book, wherein the application of your mathematical doctrine to the theory of comets and several curious experiments, which, as I guess by what you write, ought to compose it, will undoubtedly render it acceptable to those who will call themselves Philosophers without Mathematics, which are much the greater number. Now you approve of the character and paper, I will push on the edition vigorously. I have sometimes had thoughts of having the cuts neatly done in wood, so as to stand in the page with the demonstrations; it will be more convenient, and not much more charge. If it please you to have it so, I will try how well it can be done; otherwise I will have them in somewhat a larger size than those you have sent up. I am, Sir, your most affectionate humble servant,
'E. HALLEY.'

Newton had completed the first draught of the work by the end of 1685, though none of it was sent till April, 1686. The third book was presented to the Society, April 6, 1687, in proof, probably, since the whole was published (at ten or twelve shillings a copy) about Midsummer, 1687. The order of the Council of the Society to license the book was made on June 30, 1686, and the imprimatur of Pepys was dated July 5.

The part which Halley had in the matter would alone immortalise his name. He found out the ability of Newton to write such a work, prevailed upon him to write it, took charge of the publication, prevented the author from constantly mutilating it in disgust, paid the expenses of printing, at a time when, owing to his father's death and consequent litigation, he had nothing to spare (which never happened to him before or after), gave a copious explanation of it in the Philosophical Transactions, and is generally admitted to have been for a long time the only person in Europe who showed that he thoroughly appreciated the value of the work, and knew the place it must occupy in the history of discovery.

The interest attached to the second and third editions of the *Principia* (superintended by Cotes in 1713, and by Pemberton in 1726) is considerable, with reference to the corrections made in them by Newton. It would not however be worth while to specify these alterations, which are numerous, some in correction of errors, others in extension of views. With reference to the suppression of the celebrated Scholium, see COMMERCIUM EPISTOLICUM and FLUXIONS.

The *Principia* of Newton contains the dedication to the Royal Society, a short preface, verses by Halley in honour of Newton, definitions, axioms, a first book on unresisted motion, a second on resisted motion, and a third on the system of the universe. Halley's verses were somewhat altered by Bentley in the second edition, but the original readings were very nearly restored in the third. Newton wrote a short preface for each of the editions, and Cotes one of considerable length for the second. The dates of the Newtonian prefaces are, May 8, 1686; March 28, 1713; January 12, 1725-6. The following is the description of the contents of the third edition:

The definitions comprise, 1. Quantity of matter measured by density and volume jointly. 2. Quantity of motion [MOMENTUM] by velocity and quantity of matter jointly. 3. Vis insita, or vis inertiae [INERTIA]. 4. Vis impressa, or external force. 5. Centripetal force. 6. Absolute magnitude of centripetal force. 7. Accelerating force. 8. Moving force. A scholium is added on time, space, and motion, the latter considered absolutely and relatively.

The axioms are the three laws of motion [MOTION, LAWS OF] and certain corollaries, namely: 1. The composition of velocities and forces. 2. Their resolution, and deduction of the property of the lever. 3. Momentum of a system in a given direction not changed by the mutual action of the parts. 4. Nor the motion of the centre of gravity. 5. Relative motion of bodies not altered by absolute motion of the space they move in. 6. Nor by equal and parallel accelerating forces applied to all. A scholium is added, containing the experimental verifications of the third law in the cases of impact, attraction, and operation of machines.

THE FIRST BOOK*, on unresisted motion, consists of fourteen sections, and ninety-eight propositions. The numbers in parentheses refer to the propositions.

Section 1 contains eleven lemmas and a scholium. This section is explanatory of NEWTON'S peculiar mode of reasoning, which, jointly with the contents of that section, will be treated under RATIOS, PRIME AND ULTIMATE.

Section 2. On Centripetal Forces. (1) Equal areas are described in equal times. Six corollaries on the comparison of velocities and forces; the former inversely as the perpendiculars on the tangents, the latter as the sagittae of arcs described in equal times. (2) If equal areas be described in equal times about a centre, fixed or moving straightly and uniformly, the force is centripetal. Two corollaries and scholium. (3) In equiareal motion of a point about a moving centre, that point is acted on by a centripetal force, and by all by the accelerating forces which act on the centre. Four corollaries and scholium. (4) In different circles uniformly described, force varies as (vel)^2 $\div$ rad. Nine corollaries and scholium indicating the deduction in the case of the planets. (5) Given the velocities in different parts of an orbit, to find the centre of force. (6) Centripetal force in the middle of a small arc is as sagitta $\div$ (time)^2. Five corollaries; various ways of comparing forces. (7) The orbit circular, centre anywhere within; to find the law of force. 3 Cor. (8) Ditto, ditto, where the forces act in parallel lines. Scholium; same considerations apply to other conic sections. (9) Law of force in equiangular spiral. Lemma 12 (the numbering of the lemmas runs on from the first section). Equality of parallelograms about conjugates in conic sections. (10) Law of force in ellipse about the centre. 2 Cor. and Schol.; extension to the parabola.

Section 3. Motion in conic sections about the focus. (11) Law of force in ellipse about focus. (12) Same for hyperbola. Lemma 13, Latus rectum in parabola always four times focal distance. Lemma 14, Perpendicular on tangent of parabola, mean between focal distances of point of contact and vertex. 3 Cor. (13) Law of force in parabola about focus. 2 Cor. (14) In conic sections about same focal centre, latera recta are in duplicate ratio of areas described. 1 Cor. (15) In ellipses, periodic times are in sesquiplicate ratio of major axes. 1 Cor. (16) And velocities are as perpendiculars on tangents inversely, and subduplicate ratio of latera recta directly. 9 Cor.; comparison of velocity in conic section and circle. (17) Given initial position and velocity, required conic section described. 4 Cor. and Schol.

Section 4. On finding conic sections from a given focus, and *Section* 5. On finding conic sections of which no focus is given. These sections, which carry on the lemmas from 15 to 27, both inclusive, and the propositions from (18) to (29), both inclusive, are entirely geometrical exercises in drawing conic sections through given points, or touching given straight lines, &c.; the results are hardly of use, even in the rest of the work, and a particular reference would now be of no use whatever.

Section 6. On finding the motion in a given orbit. (30) To find the place of a body in a parabola at the end of a given time. 3 Cor. Lemma 28, There is no oval figure whose area contained being any two radii, can be obtained by an equation in finite terms. [QUADRATURE OF THE CIRCLE.] 1 Cor.; relates to the ellipse. (31) To find the place of a body in an ellipse at the end of a given time. Scholium; approximate method.

Section 7. On rectilinear ascent and descent. (32) Required the space described in a given time by a body descending towards a centre*. Three cases, derived from the three conic sections. (33) Law of the velocity in the preceding, in the cases derived from the ellipse and hyperbola. 2 Cor. (34) The same in the case derived from the parabola. (35) An equable description of certain areas in the conic sections just alluded to takes place during the motion. (36) The time of the whole descent of a body from rest. (37) The time of the whole descent of a projected body. (38) Velocity and time determined in descent to a centre, the force being as the distance. 2 Cor. (39) Granting the quadrature of curves [QUADRATURE], and the law of force being any whatever, to determine the time and velocity at any point of a descent. 3 Cor.

* This division relates to astronomy and its applications, and is therefore very briefly given. To give an account of every corollary and scholium would have extended the article to a great length; hence only some of the more important of them are described. But the references to other articles in this work are for the elementary student.

* The law of force, where not otherwise specified, is always as the inverse square of the distance.

Section 8. Determination of the orbit under any law of centripetal force. (40) The velocity at a given distance is always the same both in an orbit and a descent, if it be the same at any one distance in both. 2 Cor. (41) Granting the quadrature of curves, to find the orbit and the time of describing an arc, under any law of force. 3 Cor. (42) The same, the initial velocity and direction being given.

Section 9. On the motion of bodies in moveable orbits, and on the motion of the apsides. (43) How to make a body revolve equiareally in both a moving orbit and in the same fixed. (44) The difference of forces in the two cases is as the inverse cube of the distance. 6 Cor.; mostly exhibiting the conclusion in algebraical form. (45) To find the motion of the apsides in orbits nearly circular. 3 Examples; 2 Cor.

Section 10. On the motion of bodies in given surfaces, and on pendulous motions. (46) Given a plane, and a centre of force external to it, to find the motion of a point parallel to that plane, the law of force being any whatever. (47) The force in the last being as the distance, the orbit parallel to any plane must be an ellipse, and in all such ellipses the time of revolution is the same, and the same as that of a double ascent and descent. Schol. (48) and (49) Rectification of the epicycloid and hypocycloid. 3 Cor. (50) Way to make a body oscillate in a given hypocycloid. Cor. (51) If the force tending to the centre of the fixed circle in such an oscillation be as the distance, the times of all such oscillations are equal. Cor. (52) Determination of the velocity and time at any point of such an oscillation. 2 Cor.; the second being an application to the common cycloid. (53) On a given curve, to find the law of force which gives isochronous oscillations. 2 Cor. (54) A body moving on a rigid curve, under a given law of centripetal force, to find the time of its oscillations. (55) If a body move on a surface of revolution, the centre of force being in the axis, equal areas are described in equal times on a plane perpendicular to the axis. Cor. (56) To find the curve described in the last case.

Section 11. On the motion of bodies centripetally attracted to each other. (57) Two bodies, mutually attracting, describe similar figures about each other and about their common centre of gravity. (58) And with the same forces, the same curve may be described by either about the other at rest. 3 Cor. (59) Relation of the periodic times about the centre of gravity, and of one body about the other at rest. (60) In the same two cases, relation of the axes of the ellipses described. (61) And for any law of force, the bodies move round their centre of gravity as if a third body were placed in that centre, attracting with the same law of force. (62) Determination of the descent towards each other of two mutually attracting bodies. (63) Determination of the orbits of two such bodies, with given initial velocity and direction. (64) The force being as the distance, determination of the relative motions of several bodies. (65) The force being inversely as the square of the distance, and there being several bodies, one may move round another in an ellipse *nearly*, and describe areas nearly proportional to the times. 3 Cor. (66) The celebrated proposition of the three bodies, showing the diminution of the disturbance by the third body attracting both the others. (In the corollaries following, let the earth and moon, for distinctness sake, be the two bodies, and the sun the disturbing body: but let it be remembered that Newton does not mention the name of any planet nor hint at any application.) Cor. 1, If the earth had more satellites, the same proposition would apply to one as disturbed by the rest. Cor. 2 and 3, The moon moves quickest, ceteris paribus, in conjunction and opposition, and slowest in quadratures. Cor. 4, The moon's orbit is more curved in quadratures than in syzygies. Cor. 5, Hence, excentricity being excluded, the moon is farther from the earth in quadratures than in syzygies. Cor. 6, Explanation of the effect of the variation of the sun's distance on the moon's period. Cor 7, The moon's apsides progress and regress, but the former more than the latter. Cor. 8, Effect of the position of the apsides with respect to the sun. Cor. 9, Effect on the excentricity of the moon's orbit. Cor. 10 and 11, Effect on the inclination and place of the nodes. Cor. 12, Disturbance rather greater in conjunction than in opposition. Cor. 13, The same species of effect produced whether the disturbing body is the greater or the less of the three. Cor. 14, 15, 16, 17, On the dependence of the disturbing forces on the distance of the disturbing body. Cor 18, 19, 20, 21, 22, Explanation of precession of equinoxes and tides. (67) The disturbing body describes areas more nearly proportional to the times about the centre of gravity of the other two bodies than about either of them, and an orbit more nearly elliptic. (68) And the more so on account of its attracting the other bodies. Cor. (69) The attracting forces of bodies are, ceteris paribus, as their masses. 3 Cor. and Scholium.

Section 12. On the attractions of spherical bodies. (70) A particle placed inside a spherical shell is in equilibrium. (71) Spherical shells attract as if their whole masses were collected at their centres. (72) The attractions of spheres on points similarly placed with respect to them are as their diameters. 3 Cor. (73) At different internal points of a solid sphere the attractions are as the distances from the centre. Schol. (74) Solid spheres attract as if the whole masses were collected at their centres. 3 Cor. (75) The same of spheres attracting spheres. 4 Cor. (76) The same of spheres consisting of concentric layers of unequal density. 9 Cor. (77) The same is true when the forces of particles to each other are as their distances. (78) With the same law, the same is true of spheres consisting of concentric layers. Cor. and Schol.: Lemma 29. (79); (80), 4 Cor.: (81), 3 Exam.; (82); these show the method of finding the attraction of any sphere on a point without it, for any law of force. (83) The force being as the inverse *n*th power of the distance, to find the attraction of a segment of a sphere on a particle at its centre. (84) The same when the particle is not in the centre. Schol.

Section 13. On the attractions of non-spherical bodies. (85) If the attraction of the body on a contiguous particle be much greater than on one at a little distance, the attraction of the molecules of the attracting body diminishes in a higher ratio than the inverse square of the distance. (86) And the hypothesis of the last is a consequence, if the attraction of the molecules diminishes as the inverse cube of the distance, or faster. (87) If two similar bodies of the same material attract two molecules proportional to themselves and similarly placed, the attractions of the molecules on the two bodies will be proportional to their attractions on their similar particles similarly placed. 2 Cor. (88) If the particles of a body attract a molecule with forces as their distances, the whole attraction of the body will be towards its centre of gravity, and equal to that of a sphere equal to the body, and having its centre in that centre of gravity. Cor. (89) And the same if there be several bodies. Cor. (90) To determine the attraction of a circle on a point in its axis. 3 Cor. (91) To determine the attraction of a solid of revolution on a point in its axis. 3 Cor. relating to cylinders and spheroids. (92) Given an attracting body, to find (experimentally) the law of attraction of its particles. (93) If particles attract as the inverse *n*th power, a solid bounded by a plane, but indefinitely extended in all directions on one side of that plane, will attract an external particle with a force proportional to the inverse $(n-3)$rd power of the distance from that plane. 3 Cor., Schol.

Section 14. On the motion of particles from one medium into another. (94) If a particle pass through a medium contained between parallel planes, and be in its passage attracted to or repelled from the boundary of the medium it has left with a force depending on the distance from the boundary; the sine of the angle of emergence is always in a constant ratio to that of incidence. (95) And the velocity before incidence is to that after emergence as the sine of the angle of emergence to that of incidence. (96) And if the velocity must be greater before than after incidence, the angle of incidence may be made so great that the particle shall be reflected, and the angles of incidence and reflexion are equal. Scholium. (97) To give the boundary separating two media such a form that all particles issuing from one point may be refracted to another. 2 Cor. (98) To form a lens which shall have the property mentioned in the last. Scholium.

THE SECOND BOOK, mostly on resisted motion, contains 9 sections and 53 propositions.

Section 1. When the resistance is as the velocity. (1) The motion lost is as the space described. Cor. Lemma 1. (2) When no forces act but the resistance, the velocities at the beginnings of successive equal times are in geometrical progression, and the spaces described as the velocities. Cor. (3) To determine the resisted motion of ascent or descent when the force of gravity acts. 4 Cor. (4) The same when [illegible] is projected obliquely. 7 Cor. and Scholium, to the effect that the hypothesis is "magis mathematica quam naturalis."

Section 2. When the resistance is in the duplicate ratio of the velocity. (5) When no force acts, equal spaces are described in times which are in increasing geometrical progression; the velocities at the beginning of the times being in the inverse geometrical progression. 2 Cor. (6) Equal and homogeneous spheres, acted on by no forces, describe equal spaces in times which are reciprocally as their initial velocities, in which also they lose the same parts of their velocities. (7) Also, in times which are as the first velocities directly and the first resistances inversely, they lose the same fractions of their velocities, and describe spaces jointly proportional to the times and the first velocities. 4 Cor. Lemma 2, which amounts to finding the fluxions (called here momenta) of simple algebraical quantities. 3 Cor. and Scholium. (Variations.) (8) When a particle descends or ascends by gravity, the whole forces (gravity and resistance compounded) at the beginning of equal successive spaces, are in geometrical progression. 3 Cor. (9) Determination of the proportions of the times of ascent and descent to the [illegible]. 2 Cor. (10) The law of resistance being jointly as the density and the square of the velocity, required the law of density so that (gravity acting) a given curve may be described; as also the law of velocity. 2 Cor., followed by 3 Examples and Schol., and also by 3 rules.

Section 3. When the resistance is partly as the velocity, partly as its square. (11) No force acting, and times being taken in arithmetical progression, the reciprocals of the velocities, increased by a certain constant quantity, will be in geometrical progression. 2 Cor. (12) But if spaces be taken in arithmetical progression, the velocities increased by a constant quantity will be in geometrical progression. 2 Cor. (13) Gravity acting, the relation between the time and velocity in the ascent or descent is shown. Cor. and Schol. (14) Relation connecting the space described with the preceding. Cor. and Schol.

Section 4. On spiral motion in a resisting medium. Lemma 3. A property of the equiangular spiral. (15) The density being inversely as the distance from the centre, and the centripetal force inversely as its square, the particle can revolve in an equiangular spiral. 9 Cor. (16) And, other things remaining, the same can be when the force is inversely as any power of the distance. 3 Cor. and Schol. (17) To find the force and law of resistance, by which a body may move in a given spiral, with a given law of velocity. (18) Given the law of force in the last, to find the density of the medium.

Section 5. On the density and compression of fluids, and on hydrostatics. Definition of a fluid. (19) A homogeneous fluid compressed in a glass vessel (gravity, &c. apart) is everywhere equally pressed, and at rest. 7 Cases and Cor. (20) If a solid sphere form the nucleus of a fluid mass bounded by a concentric sphere, and the parts of the fluid gravitate equally to the centre at equal distances, the pressure sustained by the sphere is the weight of a cylinder which has the superficies for its base and the height of the incumbent fluid for its altitude. 9 Cor. (21) The density being proportional to the compression, and the centripetal force of particles inversely as their distance from the centre, then at distances in geometrical progression, the densities will be also in geometrical progression. Cor. (22) But if the force be inversely as (dist)², then at distances in harmonical progression the densities will be in geometrical progression. Cor. and Schol. (23) If the particles of the fluid repel each other, the density is as the compression, and then only, when the repellent force of two particles is inversely as the distance of their centres. Scholium. (On account of the particles being supposed to repel only their nearest, Newton treats this only as a purely mathematical result.)

Section 6. On the resisted motion of pendulums.* (24) The quantity of matter in pendulums of the same length, is in a ratio compounded of their weights and of the duplicate ratio of their times of oscillation in vacuo. 7 Cor. (25) A pendulum which moves in a medium in which the resistances are as the moments of the times, and another moving unresisted in a medium of the same specific gravity, make their cycloidal oscillations in the same times, and describe proportional parts of their arcs together. Cor. (26) Resistance being as the velocity, cycloidal oscillations are isochronous. (27) Resistance being as the (velocity)², the difference between the time of cycloidal oscillation in a resisting medium and a non-resisting one of the same specific gravity, will be very nearly as the arc of oscillation. 2 Cor. (28) The resistance being as the moments of the time, the resistance is to the force of gravity as the excess of an arc of descent (cycloidal) over the subsequent arc of ascent to the square of the length of the pendulum. (29) Resistance being as (velocity)², to find the resistance at any point of a cycloidal oscillation. 2 Cor. (30) Easier method of exhibiting the difference of an arc of descent and ascent. Cor. (31) If the resistance be altered in a given ratio, the difference of the arcs of ascent and descent is altered in the same ratio. Scholium Generale, containing many experimental results.

Section 7. On the motion of fluids and resistance of projectiles.* (32) Two systems of similar particles similarly placed, with given ratios between their densities, and beginning to move similarly in proportional times, will continue to do so, if there be no contact of particles except at instants of reflexion, and if there be no attracting forces of particles on one another but such as are as the diameters of corresponding particles inversely and the square of the velocities directly. 2 Cor. (33) And finite parts of these systems are resisted in a ratio compounded of the duplicate ratio of the velocities and diameters, and the ratio of the densities. 6 Cor. (34) The circular end of a cylinder encounters twice as much resistance as a sphere moving with the same velocity. Scholium, containing among other things the construction (without demonstration) of the solid of least resistance, which shows that Newton must have carried his fluxions (before 1687) far enough to solve some problems at least in what is now called the calculus of variations. (35) A medium consisting of equal particles at equal distances, to find the resistance it offers to a sphere. 2 Cor. and Schol. (36) To find the motion of water issuing through an orifice at the bottom of a cylinder. 10 Cor. Lemma 4. (37) Resistance to a cylinder moving in a non-elastic fluid. 3 Cor. and Schol. Lemma 5, 6, 7. A cylinder, sphere, or spheroid, of the same circular section, placed in a cylindrical canal of running water, or moving equally in it, are equally urged or resisted. Schol. (38) Resistance to a globe in a non-elastic fluid. 4 Cor. (39) The same when the globe is in a cylindrical canal. Schol. (40) The same, showing how to find the resistance experimentally. Scholium, containing accounts of fourteen experiments.

Section 8. On motion propagated through a fluid. (41) Pressure is not propagated through a fluid in right lines, unless when the particles lie in right lines. Cor. (42) Every motion propagated through a fluid diverges from the direct path. (43) Every tremulous body excites in an elastic medium pulses in every direction; but in a non-elastic medium, a circular motion. Cor. (44) 3 Cor. (45) Oscillation of water in a bent tube. (46) The velocity of waves. 2 Cor. (47) In pulses, the motion of the particles follow the law of an oscillating pendulum.† Cor. (48) The velocities of pulses in different media are as the square roots of the elastic force directly and the density inversely. 2 Cor. (49) Given the density and elasticity, to find the velocity. 2 Cor. (50) To find the length of the pulses. Scholium.

Section 9. On the circular motion of fluids. (Refutation of Des Cartes's vortices on the hypothesis that the resistance which arises from the want of *lubricity* of the parts of a fluid, is proportional to the velocity with which the parts of the fluid are separated.) (51) If a cylinder of infinite length revolve about its axis in a uniform and infinite fluid, and create a vortical motion, the periodic times of the particles of fluid are as their distances from the axis. 6 Cor. (52) But if the revolving body be a sphere, these periodic times are as the squares of the distances from the centre. 11 Cor. and Schol. (53) A body revolving in a vortex so as to return to its place, must be of the same density as the parts of the vortex, and move in the same manner. 2 Cor. and Scholium, completing the refutation above mentioned.

The Third Book, or application, styled 'De Systemate Mundi,' contains forty-two propositions, and preliminaries. It is to be noted that it was the original intention of Newton that this book should be a popular one; and the original

* Some of these propositions would require explanations to make their meaning clear, [illegible]

* See note in preceding column.

† Lagrange has shewn (*Mec. Anal.*) that the method of Newton here only leads to a premised theory, which proves nothing.

draft (so it is considered by Mr. Rigaud) was preserved, and was published in English, in 1728, under the title of 'The System of the World demonstrated in an Easy and Popular Manner by the illustrious Sir Isaac Newton;' and again in the original Latin. It is Opusculum XVII. in the collection of Castillioneus, who takes it from an edition published in 1731. It is not altogether popular, but, containing the mathematical propositions concerning comets to which Halley alludes in his letter, is doubtless the third book as it stood at the time when the idea of suppressing it was in Newton's mind.

Regulæ philosophandi. 1. No more causes of natural things are to be admitted than are both true and sufficient to explain their phenomena. 2. The same causes are to be assigned to effects of the same kind, as far as that can be done. 3. Those qualities of bodies which can neither be strengthened nor weakened, and which belong to all bodies which are capable of being tried, are to be considered as universal qualities. 4. In experimental philosophy, all propositions collected by induction from phenomena are to be held either exactly or approximately true until other phenomena are found by which those propositions can be made either more accurate or subject to exception.

Phenomena. 1. The satellites of Jupiter describe areas proportional to the times about the planet, and their periodic times are in the sesquiplicate ratio of their distances from the planet. 2. The same is true of the satellites of Saturn (five then known). 3. The five primary planets, Mercury, Venus, Mars, Jupiter, and Saturn, revolve about the sun. 4. And their periodic times, and that of the earth about the sun, or the sun about the earth, the fixed stars being at rest, are in the sesquiplicate ratio of their mean distances from the sun. 5. And the primary planets are very far from describing equal areas in equal times about the earth; but do so about the sun. 6. The moon describes equal areas in equal times about the earth.

(1) The satellites of Jupiter are attracted to the planet by forces inversely as the squares of their distances. (2) The same of the primary planets about the sun. (3) The same of the moon about the earth. (4) The force which retains the moon in her orbit is the same force as that which, at the earth's surface, we call gravity. Schol. This is the celebrated test-proposition, the failure of which, in the first instance, made Newton lay his theory aside. (5) A similar result inferred as to satellites about their primaries, and primaries about the sun. 3 Cor. and Schol. (6) All bodies gravitate towards every planet; and gravitation towards every planet, at a given distance from it, is as the mass of that planet. 5 Cor. (7) Attraction belongs to all bodies, and is proportional to the quantity of matter in them. 2 Cor. (8) If each of two globes be everywhere of one density at one distance from the centre, the attraction of each on the other is inversely as the square of the distance of their centres. Cor. 4. (9) In descending to the centre of a planet, gravity diminishes as the distance from that centre. (10) The motion of the planets can continue for an immensely long time.

Hypothesis 1. The centre of the solar system is at rest. (Newton takes the universally admitted hypothesis, and shows what the long disputed centre of the system is.) (11) The centre of gravity of the whole system is at rest. (12) The sun is perpetually in motion, but never far from the centre of gravity of the whole. Cor. (13) The planets move in ellipses, having their focus in the sun's centre, and they describe equal areas in equal times about that focus. (14) The nodes and aphelia of the planets are at rest. 2 Cor. and Schol. modifying the proposition by considerations of perturbation. (15) To find the axes of the orbits. (16) To find the eccentricities and aphelia. (17) The diurnal motion of the planets is uniform, and the libration of the moon arises from the diurnal motion. (18) The figures of the planets are oblate. (19) To find the proportions of the axis of a planet. (20) To compare the weights of bodies at different parts of the earth. (21) The equinoctial points must regress, and the axis of the earth must have a nutation twice in each year. (22) All the lunar motions and inequalities follow from the preceding principles. (23) The inequalities of other satellites may be derived from those of the moon. (24) The tides of the sea arise from the actions of the sun and moon. (The Jesuits' edition inserts in this place the treatises of Daniel Bernoulli, Maclaurin, and Euler, on the tides.) (25) To find the disturbing force of the sun upon the moon. (26) To find the horary increment of the moon's area about the earth. (27) From the moon's horary motion to find its distance from the earth. 2 Cor. (28) To find the diameters of the orbit in which the moon would move, but for excentricity. (29) To find the variation of the moon. (30) To find the horary motion of the moon's nodes in a circular orbit. 2 Cor. To find the horary motion of the moon's nodes in an elliptic orbit. Cor. (32) To find the mean motion of the moon's nodes. (33) To find the true motion of the moon's nodes. Cor. (Newton, in the third edition, here adds Machin's method of finding the motion of the moon's nodes.) (34) To find the horary variation of the moon's inclination. 4 Cor. (35) To find the moon's inclination at a given time. Schol. giving an account of several other peculiarities of the lunar motions, and completing the lunar theory. (36) To find the force of the sun upon the sea. Cor. (37) The same for the moon. 10 Cor. (38) To find the figure of the moon. Cor. Lemma, 1, 2, 3. On the effect of a ring of matter at the equator, disturbed by the sun, upon the earth's rotation. *Hypothesis* 2.* The effect of such a ring in causing precession is the same whether the ring be fluid or solid. (39) To find the precession of the equinoxes. Lemma 4. Comets are above the moon, and in the planetary regions. 3 Cor. (40) Comets revolve in conic sections, having the sun in a focus, and describe equal areas in equal times. 4 Cor. Lemma 5. To find a curve of the parabolic kind, which shall pass through any number of given points. Cor. Lemma 6. From any given places of a comet to find its place at any intermediate time. Lemmas 7, 8, 9, 10, 11. On the parabola, preparatory to the next propositions. (41) To find the parabolic orbit of a comet, from three observations. Example, the comet of 1680, from various observations, and a long discussion of the physical characters of comets. (42) To correct the orbit of a comet; with other examples and discussions. It is to be understood that throughout this third book continual comparison with observation occurs, which it is unnecessary to repeat as to each particular case, since the purpose of the book itself is the comparison of the results of theory with observation.

The *Scholium generale*, at the end of the Principia, has been so often quoted, alluded to, attacked, or brought forward as Newton's final explanation of the metaphysics (if that be a proper word) of his system, that even as a matter of reference we may be justified in translating it entire. It is not found in the first edition. Two notes, as marked, are Newton's.

'The hypothesis of vortices is encumbered with many difficulties. Since a planet's radius describes areas proportional to the times, the periods of the parts of the vortex should be in the duplicate ratio of their distances from the sun. And since the planets' periods are in the sesquiplicate ratio of their distances, the periods of the parts of the vortex should also be in that ratio. Since the minor vortices about Jupiter, Saturn, &c. preserve their rotation, and swim quietly in the vortex of the sun, the periodic times of the parts of the solar vortex should be equal. The revolutions of the sun and planets about their axes, which should agree with the motions of the vortices, differ from all these proportions. The motion of comets is highly regular, follows the same laws as that of the planets, and cannot be explained by vortices. They are carried most excentrically to all parts of the heavens, which could not be unless the vortices were removed.

'Projectiles, in our atmosphere, feel only the resistance of the air; take that away, as in Boyle's vacuum, and the resistance ceases, since the light feather and the solid gold fall with the same velocity in this vacuum. And such is the case in the celestial spaces which are above the atmosphere of the earth. All bodies in those spaces must move perfectly freely; and hence the planets move perpetually, according to the laws explained, in orbits of given form and position. They will persevere in their orbits by the laws of gravity; but they could by no means originally have taken that regular orbital path by the same laws.

'The six principal planets revolve about the sun in circles concentric with the sun, in the same direction, and very nearly in the same plane. The ten moons revolve about the earth, Jupiter, and Saturn, in concentric circles, in the

* In the first edition this is a lemma, which probably appeared to Newton to need no proof, as none is given. In the third it is, as we see, made an assumption. Laplace has confirmed it, by showing that the precession and nutation would remain unaltered, if the whole sea were at any one moment to be solidified without alteration of its specific gravity.

same direction, and very nearly in the plane of their planets' orbits. And all these regular motions have no origin in mechanical causes*; for the comets are freely carried in very eccentric orbits and through all parts of the heavens. By such motion comets pass freely and easily through the planetary orbits; and in their aphelia, where they move more slowly and remain longer, they are very distant from each other, and attract each other very little. This most elegant group of sun, planets, and comets can only arise from the design and government of a powerful and intelligent being. And if the fixed stars be centres of like systems, all these constructions of a similar design must be under the dominion of one being: the more since the light of the fixed stars is of the same nature as that of the sun, and all the systems give light to each other. And that the systems of the fixed stars may not fall into each other, he has placed them at immense distances from each other.

'He rules all things, not as the soul of the world, but as the lord of all things. And from his dominion, God the Ruler is often called Pantocrator†. For God is a relative term, which refers to his servants; and deity is the rule of God, not over his own body, as those think who call him the soul of the world, but over his servants. The most high God is a being eternal, infinite, absolutely perfect; but a being however perfect, without dominion, is not God the Ruler. For we say, my God, your God, the God of Israel, the God of gods, the Ruler of rulers; but we do not say, my eternal one, your eternal one, the eternal one of Israel, the eternal one of gods; we do not say, my infinite one, or my perfect one. These appellations have no relation to servants. The word God always signifies ruler; but every ruler is not God. The rule of a spiritual being makes him God; true rule a true god, the highest rule the highest god, a feigned rule a feigned god. And from the reality of his dominion it follows that the true God has life, intellect, and power; and from his other perfections, that he is the highest or most perfect being. The Eternal is infinite, omnipotent, and omniscient; that is, endures from eternity to eternity, and is present from infinity to infinity; he rules all and knows all that is or can be. He is not eternity nor infinity, but eternal and infinite; he is not time nor space, but endures and is present. He endures for ever, and is everywhere present; and by his essential existence, both in time and space, he is the creator‡ of time and space. Since any particle of space always is, and also every one indivisible moment of duration, certainly the framer and ruler of all things can never be nowhere, not at any time or in any place. Every thinking soul is, at different times, and in its different organs of sense or motion, the same indivisible person. There are parts of time successive, and parts of space coexisting; but neither in the person of man, that is, in his thinking principle, and much less in the thinking substance of God. Every man, considered as a sentient existence, is one and the same man throughout his whole life, and in every one of his organs of sensation. God is one and the same God always and everywhere. He is omnipresent, not only virtually but substantially: for the first without the second cannot be. In him§ all things are contained and moved, but without mutual effect from each other. God no way feels the motion of bodies: they feel no resistance from the omnipresence of God. All men confess that the most high God exists necessarily, and by the same necessity always and everywhere. Whence also he is throughout alike, all eye, all ear, all brain, all arm, all thought, understanding and action, not in the human or corporeal manner, but in one altogether unknown. As a blind man has no idea of colour, so we have no idea of the modes in which the all-wise God perceives and understands all things. He is altogether without body or figure, and therefore can neither be seen, heard, touched, nor worshipped under the likeness of any corporeal thing. We have ideas of his attributes, but we know nothing of the substance of any thing. We see only the figures and colours of bodies, we hear only sounds, we touch only external surfaces, we smell only odours, and taste tastes: we can perceive the inmost substance by no sense, by no reflected action; much less can we have an idea of the substance of God. Him we know only by his properties and attributes, and by the most wise and excellent structure and final causes of things; and we wonder at him for his perfections, but we venerate and worship him for his dominion. We worship him as servants, and a God without dominion, providence, and final causes is nothing else but fate and nature. From a blind metaphysical necessity, which is certainly the same always and everywhere, no variation of things can arise. Every diversity of created things in space and in time can only arise from the ideas and the will of a necessarily existing being. But God is said allegorically to see, hear, speak, laugh, love, hate, desire, give, receive, rejoice, be made angry, fight, work, build, and construct. For every expression concerning God is drawn from human affairs by a certain figure of similitude, not perfect indeed, but something like. And thus much of God, of whom it certainly belongs to natural philosophy to treat from phenomena.

'So far I have explained the phenomena of our heavens and the sea by the force of gravity: but I have not yet assigned the cause of gravity. Certainly this force arises from some cause, which penetrates even to the centre of the sun and planets, without diminution of its virtue; and which acts not according to the superficial magnitude of particles (as do many mechanical causes), but according to the quantity of solid matter; and of which the action is extended in every direction to immense distances, diminishing always in the duplicate ratio of the distances. Gravity towards the sun is compounded of the gravity towards all the several particles of the sun, and in receding from the sun diminishes accurately in the duplicate ratio of the distances, as far as the orbit of Saturn, as is made manifest by the quiescence of the aphelia of the planets, and even as far as the aphelia of the comets, if they also do not move. But I have not yet been able to deduce the reason of these properties of gravity from phenomena, and I do not frame hypotheses. For whatever is not deduced from phenomena, is to be called *hypothesis*; and hypotheses, whether metaphysical or physical, or of occult qualities, or mechanical, have no place in *experimental philosophy*. In this philosophy propositions are deduced from phenomena, and are rendered general by induction. So impenetrability, mobility, the impetus of bodies, and the laws of motion and gravity have become known. And it is enough that gravity really exists and acts according to laws explained by me, and suffices for all the motions of the heavenly bodies and of our sea.

'I might add something on that most subtile spirit which pervades solid bodies and lies hidden in them, by the force and action of which the particles of bodies attract each other at the smallest distances, and cohere when contiguous; and by which electric bodies act at greater distances, both by attracting and repelling neighbouring particles; and by which light is emitted, reflected, refracted, inflected, and gives heat to bodies; and by which all sensation is excited, and the limbs of animals are moved at pleasure, namely, by its vibrations through the solid capillaments of the nerves, propagated from the external organs of sense to the brain, and from the brain to the muscles. But this could not be explained in few words; nor is there a sufficient quantity of experiments to show and determine the laws according to which this *spiritus* acts.'

There is not a sentence of the preceding scholium which has not a direct reference to some common opinion, at home or abroad, of the physics, metaphysics, or theology of Newton's system. He had probably seen and heard enough, in the interval between the editions, to teach him on what points explanation was desirable; certain it is, that there is hardly an objector since his time who might not have found himself already answered, if he had read this scholium with candour and attention.

The commentators of Newton have one and all, as might be supposed, treated their author as a source of elementary instruction, to be explained and cleared from the effects of that brevity and obscurity (the latter more than due to the former) which the Principia almost everywhere presents. But the time has arrived when the work is hardly in the beginner's course, though it may be recommended to

* By mere mechanical causes Newton means a material machinery, such as the hypothetical vortex of the Cartesians.

† 'Dr. Pocock derives the Latin word Deus from the Arabic du (in the oblique case di), which signifies Lord. And in this sense princes are called gods, Psalm lxxxii. 6, and John x. 35. And Moses is called God of his brother Aaron, and of king Pharaoh, Exodus iv. 16, and vii. 1. And in the same sense the souls of departed princes were called gods by the Heathens, but falsely, because of their want of dominion.' (Author's note.)

‡ [illegible]

§ 'This was the opinion of the ancients, as Pythagoras in Cicero, De Nat. Deor., lib. i.; Thales, Anaxagoras, Virgil (Georgic. iv. 220, and Æneid. vi. 721), Philo (Allegor., lib. i. init.), Aratus (Phænom. init.). So also the sacred writers, as Paul (Acts xvii. 27, 28), John (xiv. 2), Moses (Deut. iv. 39, and x. 14), David (Psalm cxxxix. 7, 8, 9), Solomon (1 Kings viii. 27), Job (xxii. 12, 13, 14), Jeremiah (xxiii. 23, 24). The idolaters supposed the sun, moon, and stars, the souls of men, and other parts of the universe to be parts of the same God, and therefore to be worshipped.' (Author's note.)

him, when he has studied the modern analysis, to make himself acquainted with its methods, until he has caught their spirit. What we now want is rather an historical commentary, which shall put the student in possession of the modes of reasoning peculiar to Newton's predecessors, shall point out how the Principia came to have its form, and shall place him, as far as is possible, in the midst of that atmosphere of remnants of the old philosophy and aspirations after the new, in which the mind of Newton gained its growth.

In 1730, Dr. John Clarke published 'A Demonstration of some of the principal sections of Sir I. Newton's Principles,' &c. This work contains the greater part of the first book somewhat expanded, and with the applications of the third book intermixed. But it omits the most important part of the eleventh section: nevertheless, a student who should join with Dr. Clarke's work the article GRAVITATION in the present one, would have the most important parts of the Principia, as far as is necessary to gain an insight into Newton's methods.

In the same year, 1730, George Peter Domck published his 'Philos. Math. Newt. Illustratæ Tomi Duo, Londini.' (This work is inadvertently called an edition of the Principia in NEWTON, and its author's name is spelled Donick.) The first volume of it is only a preparatory course of mathematics; the second gives a large part of the first book in Newton's manner, and gives more of the results of the eleventh section. It also enters upon some of the numerical applications of the third book.

The Commentary of the Minims (Jesuits they are usually but wrongly called) Le Sueur and Jacquier (1739) is an excellent performance for its time, considered as attempting to smooth the details of the mathematical difficulties. It uses algebra freely, but is totally insufficient to show the use of the differential calculus as now known; but it very frequently develops satisfactorily a point at which Newton only hinted.

Emerson's 'Short Comment on Newton's Principia,' 1770, is a brief explanation of some of the mathematical difficulties and obscurities, followed by defences of the Principia, the Optics, and the Chronology. Emerson defended everything of Newton's.

The popular explanations of Maclaurin, Pemberton, and Voltaire are too widely known to need description; they do not much help the mathematical student. Many so-called explanations of Newtonian philosophy (such as Benjamin Martin's, 1751) are literally nothing but treatises on general physics.

The additions to Madame du CHASTELLET's translation consist of a popular *resumé* and the mathematical treatment of various questions of the Principia. The latter must be considered as emanating from Clairaut, since they were his lessons to his pupil. Some have supposed that Voltaire's work belongs in the same sense to Madame du Chastellet.

In the 'Mécanique Céleste,' book 16, cap. 2, Laplace has exhibited the results of Newton's lunar theory, and connected them with the modern analysis of the subject to a certain extent. The preciseness of the manner of compressing Newton's results renders this chapter valuable, and likely to assist the student of the Principia.

Mr. Airy's development and extension of the results of the eleventh section (which forms the article GRAVITATION in this work) places one of the methods of the Principia, and one which ought to last, within the reach of every student. It is unique, the difficulties of the eleventh section having left it almost without a commentator, and altogether without an explainer; and it takes in several of the discoveries of the present time.

Many commentaries on the Principia have been written at Cambridge by private tutors for the use of their pupils, of which some have been printed. Of the following we have never seen more than the title: 'Excerpta quaedam e Princ. Phil. Nat., cum notis variorum,' Cambridge, 1765. There is Carr's three sections of Newton, a modern work, and an exposition of various parts of the Principia, contained in the second edition of Professor Whewell's 'Dynamics.'

To give a view of the foreign objections to Newton's system, at the time of its first introduction, the following works may serve: 1, 'Collection of Papers which passed between Mr. Leibnitz and Dr. Clarke, in 1715 and 1716,' by Dr. Samuel Clarke; London, 1717. 2, 'Traité de Paix entre Des Cartes et Newton,' by the Jesuit Aimé-Henri-Paulian; Avignon, 1763. 3, 'Le vrai Systême de Physique générale de M. Isaac Newton, exposé et analysé en parallele avec celui de Des Cartes,' by the Jesuit Louis Castel; Paris, 1743 (a defence of Descartes). 4, 'Anti-Newtonianismus,' by Celestini Cominale, M.D.; Naples, 1754. 5, 'Discours sur les différentes Figures des Astres,' by Maupertuis, the first assertor of Newton's doctrines in France; Paris, 1732, and in the collection of his works. 6, 'Letters to a German Princess,' by Euler (first published in 1770, translated into English by Dr. H. Hunter, 1795).

The most celebrated comments in the way of objection are those of Leibnitz, John Bernoulli, and Huyghens [HUYGHENS]; the first and second real admirers of the genius of Newton, the third also an admirer after his fashion. Many of their remarks may be found in the published correspondence of the first two, but the history of the effect produced by the Principia in the years following its publication is scattered in too many places for us to attempt to give the particular publications which should be consulted.

PRINCIPLE, D'ALEMBERT'S. [FORCES, IMPRESSED AND EFFECTIVE; VIRTUAL VELOCITIES.]

PRINGLE, JOHN, the youngest son of Sir John Pringle, Bart., and Magdalen Eliott, the sister of Sir Gilbert Eliott, Bart., was born at Stichell-House in Roxburghshire, April 10, 1707. Having received at home, under a private tutor, the elements of a classical education, he entered the university of St. Andrews, where a relative of his father, Mr. Francis Pringle, was at that time professor of Greek. After keeping the ordinary number of terms, he removed to Edinburgh, in October, 1727, in order to qualify himself for the medical profession; but in the year following he proceeded to the university of Leyden. It is stated by Dr. Kippis, on the authority of Mr. James Boswell, that Pringle was at one time intended to follow a mercantile life, and that on leaving Edinburgh he went to Amsterdam for that purpose, but that his attention was accidentally drawn to the study of medicine by attending a lecture of Boerhaave in the university of Leyden. He entered this university in 1728, and took the degree of doctor of physic, 20th July, 1730, his diploma bearing the signatures of Boerhaave, Albinus, Gravesande, and other eminent individuals. His inaugural dissertation was entitled 'De Marcore Senili.' On quitting Leyden, he proceeded to Paris, where he completed his medical studies, after which he settled as a physician at Edinburgh. He had not however given his attention exclusively to medicine. In 1734 he was appointed by the magistrates and council of Edinburgh to the professorship of moral philosophy in the university of Edinburgh, jointly with Mr. Scott, during the life of the latter, and solely after his decease. Dr. Kippis says he was appointed to the chair of pneumatics and moral philosophy, but no mention of the former of these sciences is to be found in any other notice of Pringle's life to which we have referred. He continued to practise at Edinburgh as a physician till 1742, when he was nominated physician to the Earl of Stair, who then commanded the allied armies of England and Austria, and through whose recommendation he received the same year the further appointment of physician to the military hospital in Flanders, at a salary of 20*s.* a day, and half-pay for life. He was present at the battle of Dettingen (26th June, 1743), shortly after which he was promoted by the Duke of Cumberland, second son of George II., to be physician-general to his majesty's forces in the Low Countries, whereupon he resigned his professorship. The benevolence of his disposition and the exemplary zeal and ability with which he discharged his official duties while connected with the army, are attested by all who knew him. Impressed with the suffering frequently attendant on the sudden movement of an army, which necessitated as sudden a removal of the hospitals or the abandonment of the men to the doubtful generosity of an enemy, he applied himself earnestly to the consideration of the means whereby it might be mitigated or removed. Prior to this it had been the custom to place the sick and wounded at a distance from the army, but even then it often happened that a position of salubrity was incompatible with one of safety. Through his exertions a convention was entered into, in the early part of the campaign of 1743, between Lord Stair and Marshal Noailles, for the mutual protection of the hospitals of both armies. This convention was faithfully adhered to by both the French and English generals. Pringle's situation afforded ample opportunity of observing the influence of climate, diet, confined and humid quarters, habits of intemperance and uncleanness, &c. These, with the circumstances of the epidemics peculiar to armies, he carefully recorded and digested, applying himself particularly to the investigation of the proper mode of treatment under different circumstances. His treatise 'On the Diseases of the Army,' which appeared in 1752, and which passed through seven editions, besides being translated into the French, German, and Italian languages, was not a work from which the medical practitioner alone was capable of deriving instruction. Among other instances corroborative of its general utility, General Melville, who, while governor of the Neutral Islands, was instrumental in saving the lives of nearly seven hundred of his soldiers, attributed his success to the plainness of the language employed in this work and the soundness of the information which it conveyed.

Dr. Pringle was recalled from Flanders in 1745 in order to attend the army employed under the Duke of Cumberland in suppressing the Scotch rebellion. He remained with the forces till after the battle of Culloden (16th April, 1746). The year following he again accompanied the army abroad, but on the conclusion of the peace of Aix-la-Chapelle (30th April, 1748), he returned to England, after which he resided principally at London, as physician in ordinary to the Duke of Cumberland. He had been elected in 1745 a member of the Royal Society, and his communication to their published Transactions of a paper entitled 'Experiments on Septic and Anti-septic Substances, with remarks relating to their use in the theory of medicine' (1750), to which the Copley medal was awarded, added to his reputation. Empiricism indeed appears in some measure to have been looked upon by him as not only the beginning but the end of all useful inquiry, and he not merely entertained a strong aversion to all hypothesis, but accorded comparatively little value to theory even when based on experiment. Upon one of the members of the Royal Society remarking to him that it was at least necessary to reason on the results of observation and experiment, he is said to have replied, 'The less the better; it is by reasoning that you spoil everything.'

In 1753 he was elected one of the council of the Royal Society. In 1758, on relinquishing his appointment in the army, he was admitted a licentiate of the College of Physicians. In 1761, soon after the accession of George III., he was appointed physician to the queen's household, and in 1763 physician extraordinary to her majesty. The same year he was chosen a member of the Academy of Sciences at Haarlem, and fellow of the College of Physicians, London. In 1766 he was elected a member of the Royal Society of Sciences at Göttingen, and the same year the dignity of baronet was conferred upon him by George III. In 1772 he was elected president of the Royal Society. In 1774 he was appointed physician extraordinary to his majesty. In 1779 he became a member of the Academy of Sciences at Madrid, the Society for the Promotion of Agriculture at Amsterdam, the Academy of Medical Correspondence at Paris, and the Imperial Academy of Sciences at St. Petersburg. In 1778 he succeeded Linnæus as foreign member of the Academy of Sciences at Paris, an honour which that body has hitherto restricted to eight individuals. The same year he became foreign member of the Academy of Sciences and Belles-Lettres at Naples, and in 1781, a fellow of the then recently instituted Society of Antiquaries at Edinburgh.

As president of the Royal Society the annual presentation of the Copley medal devolved upon him, and on each of these occasions he read before the members a discourse on the history and present state of the particular science the extension of which it was the object of the medal of that year to reward. These discourses, six in number, were published the year after his death, by his friend Dr. Kippis, in one volume, 8vo.

About the year 1778 a dispute arose among the members of the Royal Society relative to the form which should be given to electrical conductors so as to render them most efficacious in protecting buildings from the destructive effects of lightning. Franklin had previously recommended the use of points, and the propriety of this recommendation had been acknowledged and sanctioned by the Society at large. But after the breaking out of the American revolution, Franklin was no longer regarded by many of the members in any other light than an enemy of England, and as such it appears to have been repugnant to their feelings to act otherwise than in disparagement of his scientific discoveries. Among this number was their patron George III., who, on its being proposed to substitute knobs instead of points, requested that Sir John Pringle would likewise advocate their introduction. The latter hinted that the laws of nature were unalterable at royal pleasure; whereupon it was intimated to him that a president of the Royal Society entertaining such an opinion ought to resign, and he resigned accordingly. This story, though it does not appear to be in print, having been suppressed in deference to royalty, was current at the time among the members of the Society, and there is no doubt of its truth. Dr. Hutton alludes to it in the following extract from his 'Mathematical Dictionary':—'Considering the great attention that was paid by Sir John Pringle to the various and important duties of his office, and the great pains he took in the preparation of his discourses, it was natural to expect that the burthen of his honourable station should grow heavy upon him in a course of time. This burthen, though not increased by any great addition to his life, for he was only six years president, was somewhat augmented by a fall from which he received some hurt. From these circumstances some persons have affected to account for his resigning the chair. But Sir John Pringle was naturally of a strong and robust frame and constitution, and had a fair prospect of being well able to discharge the duties of his situation for many years to come, had not his spirits been broken by the most cruel harassings and baitings in his office. His resolution to quit the chair originated from the disputes introduced into the Society concerning the question whether pointed or blunt electrical conductors were the more efficacious, and from the cruel circumstances attending those disputes. These drove him from the chair. Such of those circumstances as were open and manifest to every one were even of themselves perhaps quite sufficient to drive him to that resolution. But there were yet others of a more private nature which operated still more powerfully and directly to produce that event, which may probably be hereafter laid before the public.'

In 1781 he disposed of his house in Pall Mall, and the greater part of his library, and removed to Edinburgh, where he purposed residing permanently, but the rigour of the climate, the state of his health, and a restlessness of spirits induced him to return to the metropolis the same year. On quitting Edinburgh he presented the College of Medicine in that city with three manuscript volumes in folio, on the condition that they should neither be suffered to leave the college nor to be printed. He died January 18, 1782. His remains were interred in St. James's church, with great funeral solemnity, and a monument, by Nollekins, at his nephew's expense, was some time after erected to his memory in Westminster Abbey. A list of his published works is given in Watt's 'Bibliotheca Britannica,' and under the article 'Sir John Pringle,' in Brewster's 'Cyclopædia.' They are not numerous, and, with the exception of those already mentioned, they no longer possess much interest. The circle of his correspondents included the most eminent men of science in Europe, more particularly those of France, Germany, and Holland, with whom he kept up an active intercourse both by letter and by the attention and hospitality he showed them during their visits to the metropolis, but the extent and interest of his epistolary correspondence can be but imperfectly judged of, owing to the circumstance of his having ordered the whole of his letters to be destroyed a short time before his decease.

(*Life of Sir John Pringle*, by Andrew Kippis, D.D., prefixed to Sir John Pringle's Six Discourses above referred to; *Éloge de M. Pringle*, by Condorcet, *Œuvres Complètes*, tom. ii., pp. 226-247.)

PRI'NIA, Dr. Horsfield's name for a genus of birds first defined in *Linn. Trans.*, vol. xiii., and figured and described in the Doctor's *Zoological Researches in Java*.

Generic Character.—Bill rather lengthened, much compressed, entire; rictus smooth, wings rounded, tail broad and cuneate; feet large, strong. (Sw.)

Example, *Prinia familiaris*.

Description.—Dark brown above with a faint tint of cyanic. The throat and neck anteriorly are white, and the breast and abdomen pale sulphureous yellow. The wings crossed transversely in an oblique direction, with two white bands. Tail-feathers, except the two intermediate ones, marked near the end with a broad band of blackish brown, tips dirty white. Intermediate tail-feathers brownish throughout underneath, and, near the extremity an almost imperceptible transverse band of a deeper hue. Tarsi yellowish. Bill corneous brown above and at the point; its base pale yellow.

This is the *Prinya* of the Javanese, *Familiar Creeper* of Latham.

Locality, Habits, &c.—Abundant in many parts of Java, near villages and gardens, in the confines of which, among trees and shrubs, it builds its nest. It is a sprightly bird, sporting among the branches in short and rapid flights, and has received its native name from its lively and pleasant notes. (Horsf.)

Mr. Swainson (*Classification of Birds*) thinks that *Prinia* may be a subordinate type or subgenus of *Drymoica*. [SYLVIADÆ.] He observes that the *Priniæ* have all the activity and familiarity of the true Wrens (*Troglodytes*), and so much resemble them in general appearance, in their short sweet song, and the throwing up of the tail, that it is not very surprising that they should have been classed with the scansorial creepers.

Prinia familiaris.

⁎ In the article PLOVERS, *Himantopus Melanogaster* is erroneously printed under the cut instead of *Himantopus Melanopterus*, as well as in four places in the adjoining columns. The reader is requested to substitute '*melanopterus*' for '*melanogaster*,' in each of these cases.

PRINSEP, JAMES, was descended from a family of Swiss extraction which had been some time settled in England. He was born in the year 1800, and went out to the East Indies at an early age in the service of the East India Company in the Mint department. On his arrival in India he was appointed assaymaster at Benares, where he remained about ten years. Here he collected the materials of his 'Sketches of Benares,' which perhaps give some of the best representations of Indian life yet published. He planned and constructed many works of public utility, and engaged in a valuable series of statistical inquiries connected with Benares. At this time he wrote an elaborate memoir on the mode of determining accurately the point at which the precious metals fuse, which was published in the 'Philosophical Transactions.' Subsequently he was elected a Fellow of the Royal Society.

When the Benares mint was abolished, Prinsep was transferred to that at Calcutta. He had previously contributed to the 'Gleanings of Science,' conducted by Capt. Herbert, and on the departure of that gentleman from Calcutta he became the secretary to the physical class of the Asiatic Society, and editor of the 'Gleanings,' which he remodelled in 1832, under the title of the 'Journal of the Asiatic Society,' a work which has contributed in an eminent degree to the extension of every species of information in India. His attention having been directed to the subject of Bactrian coins, he made numerous discoveries which enabled him to fill up the blank left in the history of the successors of Alexander the Great in Bactria, and constructed a nearly unbroken series of numismatic records, which extended from the Macedonian king to modern times.

On the departure of H. H. Wilson for England in 1832, he became secretary to the Asiatic Society, and he now began to follow up the steps of Jones, Colebrooke, and Wilson, in the field of Indian antiquities. Meantime his labours as editor of the 'Journal' were unabated; he was in a great measure the engraver and lithographer for it; and he carried on an extensive correspondence in India and with Europe, besides contributing a number of valuable articles on a great variety of subjects, especially chemistry, mineralogy, Indian numismatics, and Indian antiquities. The most interesting of his discoveries is the deciphering of inscriptions which had remained a sealed book to all previous Orientalists, and which are important as connecting the history of India with that of Europe: the name of Antiochus the Great and the mention of his generals as commanding in the north of India, occur in two edicts of Asoka, or Piyadasi, king of India.

Under the weight of these and other labours his health began to break down. It was hoped that a voyage to England would restore him; but after an illness of eighteen months, he died, on the 22nd of April, 1840, in the 40th year of his age. His case is said to have borne a considerable resemblance to that of Sir Walter Scott. His death has left a blank in the progress of knowledge and civilization in India which will not perhaps be readily filled up.

(*Delhi Gazette*, July 8, 1840; *Proc. Roy. As. Soc.*, 1840.)

PRINSE'PIA, a genus of plants of the natural family of Chrysobalaneæ, so named by Dr. Royle in honour of James Prinsep, the late distinguished secretary of the Asiatic Society of Calcutta, in consequence of his contributing, by his researches into the meteorology of India, to the progress and right understanding of the geography of plants, an important branch of botany. The genus consists of only a single species, remarkable for its thorny appearance, but it may be considered typical of the labours of the individual whom it is designed to commemorate, as, early in the season, it is conspicuous for the abundance of its inflorescence, and, later, for that of the purple-coloured berries with which it is loaded. The seeds are large, and yield by expression an oil which is highly esteemed by the mountaineers of the Himalayas, where it is indigenous, and which by Europeans is thought a good substitute for salad oil.

PRINTING, in the widest sense of the word, may be defined to be the art of producing copies of any writing or other marks by pressure, either upon a substance so soft as (like wax or clay) to take the shape, whether in relief or by indentation, of the stamp applied to it, and yet not so perfectly fluid (like water) as to refuse to retain the form so given to it, or upon a substance sufficiently bibulous or otherwise attractive as to receive colour from some pigment with which the stamp is daubed. The essence of printing is the production of a copy by pressure. Correctly speaking however it is not an exact copy or fac-simile which printing produces in any case; so far from that, wherever the surface is raised in the stamp, it is sunk in the impression, and *vice versâ*, and even a merely coloured mark is always reversed in form; but, what is alone of importance, all the impressions are exact copies of one another, and also bear a certain and perfectly assignable relation to the stamp or type.

Even on a theoretical view of the subject, printing by means of merely a variegated surface of stamp, or, in other words, the reproduction, in soft substances, of cameos and intaglios, would seem to be the simpler and more obvious of the two kinds of printing we have mentioned. This may be said to be printing by pressure alone. In the other kind of printing, by the transference of colour, there is required the introduction, in addition to the type and its recipient, of a third element or agent, namely, the colour to be transferred. And this was an addition very little likely ever to be made until the idea of multiplying copies of coloured marks had itself occurred, that is, until the very object had been thought of which this was the only means of accomplishing, and which was the only object this process was suited to accomplish. Having a seal or cut stamp in his hand, the making an impression with that upon wax or any other soft substance was extremely natural for a person wishing on any occasion to leave his mark or sign; it was the same thing, in fact, with notching a piece of wood or stone with a knife or other sharp instrument, with this difference only—that the knife makes its marks by excision, or altogether removing and abstracting part of the substance operated upon; the stamp, by extrusion, or merely pushing it aside. Or still more nearly it resembles the rudest and rudest of all ways, making a mark, namely, by dealing a blow. But it is a mode of making a mark only; that is its sole purpose and object. There is no thought, so long as this kind of printing exclusively is used, of multiplying copies of the same mark; that is an idea far removed from the first and most natural employment of a dry stamp or seal, and yet perhaps more likely to be suggested by such stamping or sealing (although capable of being so realised) than by some other things—by the more common process, for instance, of copying by imitation. If a transcriber had ever had before him a written page, with the ink not yet dry, which he was laboriously reproducing with his pen, the slowness of the procedure, especially if he were pressed by an active and growing demand on the part of the public for books, might have led him to the thought of the possibility of performing the whole task in a manner at once, by merely impressing the wet writing upon the blank paper, and then re-transferring it from the reversed copy thus made to another sheet, in order to recover the original position of the characters. And if by any means the reversed copy could be kept moist, or its moisture repeatedly renewed, here was a method of procuring in the same easy manner an indefinite number of copies. The mechanical facilities were still to be invented, but this was the elementary idea of what we have been regarding as the second kind of printing; which, it thus appears to us, would probably not be suggested by the first kind at all, but rather by the desire of effecting an object (namely, the multiplying of copies) altogether different from that (namely, the mere making of a mark) which was the primary purpose of a dry stamp or seal, and only presenting itself at a much later and more advanced stage in the progress of civilisation.

These considerations may help to account for the historic fact that the use of engraved seals for impressing soft substances preceded by so many centuries the invention of the art of printing by the transference of a pigment, or, in other words, by means of coloured stamps or types. Of the great antiquity of seals for making marks with, we have abundant evidence. Seals and signets are repeatedly mentioned in the Jewish scriptures, and, we know, were in common use among all the civilised nations of antiquity. If the idea of multiplying copies of books or writings had chanced to occur in combination with that of this employment of dry seals, it might no doubt have produced an invention serving the same purpose with our modern printing, but in that case the first printing would probably have been that indented or embossed kind which has been lately introduced for the use of the blind. After that had been practised for some time, ingenuity or accident would have suggested the introduction of a pigment for the purpose of making the indentations more distinctly visible; and from that to the omission of the indentations altogether would have been apparently an easy and obvious step, though it might have happened here too, as in many other cases, that all the advantages of the new process would not be at once perceived, and a part of the old method, the utility of which it had really superseded, would nevertheless for a considerable time continue to be practised as before. But the fact, as we have said, appears to be that the art of printing did not take its rise in this way at all, but from the combination of the idea of multiplying copies of books with the other idea of the possibility of taking off an impression from a page of writing while yet wet by the simple act of applying to it another flat surface to receive a portion of the ink or other pigment. We say, applying the receiving substance to the writing; for even in this point of detail the process would probably differ altogether from the common mode of using a seal, which is impressed upon the receiving substance, not that upon it.

Nevertheless the principle of an engraved or uneven surface might still for a particular purpose be called in to the aid of the process of pigment-printing, although it had nothing to do with the suggesting of that process. Suppose the writing which is to be transferred by such mode of printing to be traced in visible black characters upon a smooth surface of wood or metal, how is the pigment to be most conveniently renewed every time it gets dry or faint? With an even surface it is evident that this could only be done by the tedious method of retracing every line of the writing with a pen or brush, a method which—besides its consumption of time, making printing, in fact, as slow as writing—would probably be found to be inefficient, as leaving the page dry or half dry in one part before it could be inked in another. But by either cutting hollows for the ink, or causing the characters to stand out in relief, the great advantage is gained of being able to spread the pigment by a few sweeps of the brush along every line which it ought to colour, without leaving any of it upon the intervening parts of the wood or metal. In the case of hollow lines being cut (as in copperplate printing), the ink that is spread in the first instance over the whole surface is easily wiped away from the rest without being taken out of the hollows.

At this point then we may be said to have at last obtained the art of printing in a practical shape. The art was now invented. This is precisely the art of printing as it has been known in China since the middle of the tenth century, when it is said to have been discovered by a minister of state named Fung-taou, and as it is still practised there. The page of writing to be multiplied is pasted down upon the smooth surface of a prepared block, commonly of pear-tree, on which it leaves an impression of the characters in an inverted form, and then the block thus marked is made ready for being printed from by all the blank parts of the face of the wood being cut away, and the lines forming the characters being thus left in relief, so as alone to receive the ink every time the brush is applied.

In such a language as the Chinese, which is without an alphabet, or, at least, in which the elementary characters have not been reduced to the same limited and commodious number as in most other languages by making them represent sounds instead of ideas or things, this is the only kind of printing that is generally applicable. The subsequent improvements or extensions of the principle of the invention are all dependent upon the common alphabetic mode of writing.

Even in Europe however, although the mode of writing was alphabetic, it was the Chinese mode of printing that was first practised. Some have even supposed that the knowledge of the art was originally obtained from the Chinese; and indeed, besides what other less direct communication there may have been, Marco Polo, who returned from China about the end of the thirteenth century, had seen and described at least one application of the invention in that country, the fabrication of a species of paper-money by stamping it with a seal coloured with cinnabar (vermilion). But, as far as we can trace, it was not till fully a century after this that even this simplest kind of printing began to be practised in Europe. It appears to have been first applied to the fabrication of playing-cards and manuals of popular devotion, the latter for the most part consisting, like the cards, of merely a single page, though in some instances assuming the form of little books of several pages. It is believed that about the year 1400, or soon after, both these articles, which had previously been manufactured by hand, and each copy of course by a separate operation, began to be multiplied, like the Chinese paper-money, from engraved blocks or stamps. There is no record of this innovation, but the fact is inferred from the perfect similarity of several copies of the same page, which could only have been produced by their having all been impressions from a common original. The playing cards thus fabricated are merely pictures; but many of the devotional manuals, besides pictures, which in these also fill the greater part of each page, present short texts from scripture, and other examples of engraved letters and words. It is evident however that the essence of the new art is as much in the pictures as in the legends, which are only pictures of another kind.

The æra of these block prints and books, as they are called, may be stated to be the first half of the fifteenth century: one in Lord Spencer's collection bears the date of 1423, and there is reason to believe that other specimens were executed almost as late as 1450. Of the block-books of any considerable magnitude the two most remarkable are the 'Biblia Pauperum,' a small folio of forty leaves, each containing a picture, with a text of scripture, or some other illustrative sentence under it, which is supposed to have been produced some time between 1410 and 1450; and the 'Speculum Humanæ Salvationis,' consisting of sixty-three leaves of the same small folio size, containing in all fifty-eight pictures, with two lines of Latin rhyme under each. With regard to this last in particular however there has been a great deal of disputation, some denying altogether its claim to be reckoned a specimen of block-printing, in so far as the legends are concerned; but it is now generally admitted that at least some of the legends have every appearance of having been printed from the same block with the picture, although in other cases they seem to have been subsequently inserted from moveable types. The probability is that at first the 'Speculum' was entirely a block-book, but that in subsequent editions the block-printing was mixed with printing from moveable types: the few copies that have come down to modern times are perhaps made up of leaves collected from several impressions, some in which moveable types were and others in which they were not used. Like the 'Biblia Pauperum,' it has no date; but it is generally admitted to have in all probability been first printed before 1440. Another block-book that was frequently printed, and which is noticeable as consisting wholly of text, without pictures, was the small Latin Grammar of Donatus, the common school-book of those days. These block-books are, like the Chinese books at this day, printed only on one side of the leaf; and they appear to have all been produced in the Low Countries.

At this point, as we have already observed, printing would have stopped, if the art of alphabetic writing had remained undiscovered. At most, the art could not have been carried beyond what has been called logography, or the printing with types each containing a whole word, a method which is in partial use in China, and has even in recent times been attempted among ourselves, but which is manifestly of very limited application. Logography, indeed, is merely a modification of block-printing; the principle is the same whether the block or type contain a whole word, a whole line, a whole sentence, or a whole page.

It is not unlikely however that the partial employment of logography in the infancy of European printing may have been what suggested alphabetic printing. There is good evidence that some words of common occurrence were early cut out on separate stamps or types; and although this may have been done only after the invention of alphabetic printing, to save the trouble of composition (or setting up the words from the letters), it is possible that the same thing may also have been done while only block-printing was known, with the view of saving the repeated cutting out of the same words. If so, the perception, thus awakened and turned to account, of the fact that two different pages often contained some words in common, would be apt, it may be thought, to conduct to the reflection that all words and all pages that could be printed were composed out of the same twenty-four letters, and that therefore if a sufficient number of types consisting each of a single letter could be provided, the same types that had been made use of in printing any one page might, with the mere trouble of re-arrangement, be made to serve for printing any other. Here was what we may call quite a new principle. Logography was indeed the employment to a certain extent of moveable types; but the principle of moveable type printing was no more there than we can say the principle of alphabetic writing is to be found in the 214 radical characters of the Chinese. The universality which is the essence of a principle is equally wanting in both cases.

Yet, whether it may have been arrived at through the medium of logography or not, it may be safely affirmed that, where alphabetic writing was known, alphabetic printing could not be long in being found out. It was in fact in a manner already invented, in the co-existence of pigment printing on the one hand, and of alphabetic writing on the other; for it was the mere resultant, without the assistance of any third element, of the combination of these two ideas. Not that even this simple combination would of necessity be immediately made; the history of discovery sufficiently attests that it will often be a considerable time before a third thing is thought of which would be at once accomplished by the mere bringing together, and into simultaneous and accordant action, of two things already familiarly known and practised; but still, fortuitously or through reflection and experiment, the new idea is much more likely to be struck out in these circumstances than if a more complex combination were required to produce it, and, especially where the state of society supplies any considerable stimulus to the attainment of it, cannot be very long in being arrived at.

The common art of printing, in essentially the same degree of completeness in which we now possess it, had certainly been discovered before the middle of the fifteenth century; but when, where, and by whom each successive improvement of the original pigment-printing by means of engraved blocks was discovered and first put in practice is not so easily settled. The employment of moveable types, the production of such types by the process of casting them in metal, and the formation of the matrix, or mould, by means of the punch, or stamp of hardened steel by which the matrix is impressed or hollowed out; these, disregarding mere mechanical facilitations, may be considered as the three great organic revolutions by which block-printing was transformed into the art as it now exists. They are far, indeed, from being upon a level in point of importance; they descend in value in the order in which we have enumerated them, which must also have been the order in which they followed each other; and the third contributes so little to the completion of the invention, as compared with either the first or second, that we might perhaps without much injustice omit it altogether. Yet, strictly considered, it too has the same characteristic with the others of converting a process of mere imitative copying into one of what we may call identical reproduction, or, in other words, substituting the unity of a single mechanical operation for a succession of separate manipulations. The invention of printing may be said to be, in all its parts, distinguished from mere writing by this very characteristic; this is throughout its principle, and that in which it consists; in block-printing, the page, having been once cut out upon the wood, is afterwards reproduced by a single touch of the inking-brush as perfectly as it could be by retracing every line of every letter with the pen; by the employment of moveable types, the same letters which have already served to print one book are made to print any other, without a new cutting, however new the matter, or any further trouble except a re-arrangement of them; by the art of founding or casting the types in metal, the separate fabrication of every single type is done away with, and any number of types of the same character are obtained by merely dropping the metal into the matrix; and, finally, by the contrivance of the punch, matrices themselves are thus mechanically multiplied as well as types. Pigment stamping, the breaking up of the block-page into single letters, the substitution of letters of cast metal for those of cut wood, and the production of many matrices from one punch, the four successive steps constituting the invention of printing, have thus all one end and aim. This very circumstance might enable one of them in a great measure to suggest another.

Simple as the first of the four successive discoveries—stamping or printing with a pigment—may be thought, it was perhaps both the most important and the most difficult to achieve of the whole. Even if the art of printing had never been carried farther than the Chinese have carried it, how precious a gift of heaven would it not still have been! how incalculably would it not have elevated the function of written language! Indeed that primitive sort of printing would have been all-sufficient, and in every respect the best, in all those numerous instances in which stereotyping (essentially the same thing) is now resorted to, even in countries possessing an alphabet; and a time perhaps is coming when in all countries the increase in the number of readers may make that kind of printing the kind most employed, as it probably would be in China from that cause alone, even did the nature of the written language admit of the employment of moveable types. The idea of producing an impression by a coloured stamp would seem also to have lain very remote from ordinary operations and habits of thought; men had been using dry seals from the earliest times of Eastern civilization, but we find no trace of this other kind of stamping, at least for the purpose of multiplying writing, even in the East, till about nine centuries ago, and none in Europe till five hundred years later. Neither Egypt, nor Greece, nor Rome, had thought of this, with all their ingenuity, and among all their arts. He therefore, we may say, was truly a great genius who first meditatively conceived the notion of making an engraved seal or block thus produce a permanent impression of itself upon a hard surface by merely besmearing it with a little colouring matter—simplest of all simple operations as that seems, now that we are familiar with it, and must have seemed indeed as soon as it had been even once performed.

As for the three subsequent improvements, which constitute the whole portion of the art of printing indisputably invented in Europe in the fifteenth century, and to which alone the claims of the several individuals to whom the invention has been attributed have any reference, even the chief of them, the substitution of types containing each a single letter for blocks containing an entire page, must, we apprehend be considered as inferior to the primary

Chinese discovery or novelty, or real originality of conception, as it evidently is in importance. That wonderful instrument, the alphabet, being already invented, the improvement consisted merely in chopping down the engraved wooden block into as many separate pieces as there were letters cut upon it. The first time that a school-alphabet was printed by block, the thing was in a manner done; here stood the twenty-four letters already separated to the eye, and to all respects, except in so far as regarded the material cohesion of the wood; and actually to part them was no more than what is done by every child who finds himself in possession of a similar alphabet embossed upon a cake of gingerbread. Probably this was done in the first instance without any forethought of their recomposition in a new order; so that there may have been moveable types before moveable-type printing was dreamed of, and the latter may have been suggested by the former. But at any rate, an invention the idea of which consisted simply in supposing the arrangement in a different order of a number of objects already visibly unconnected, or separable, must in one way or another have been speedily brought about. The casting of metal types again was only an application of the art of founding, which is one of the most antient of the arts practised by men; and the fabrication of the matrix by a punch was merely an example of the familiar practice of receiving the impression of a stamp or seal upon a substance softer than itself, and precisely the same thing with the very common mode of stamping coins by hammering.

Four names have principally figured in the controversy that has been raised about the invention of printing:—John Gutenberg (paternally Gensfleisch), of Strasburg; John Fust (or Faust), of Mayence; Peter Schoeffer (in Latin Opilio), of Gernsheim; and Lawrence Coster (or Janszoon), of Haarlem. The pretensions of John Mentelius, of Strasburg, need scarcely be noticed. In addition to the accounts which will be found under these names, we shall here subjoin a summary of what appears to be the most probable state of the facts and the version of the matter that is now generally received.

With regard to the tradition recorded by Hadrian Junius, which ascribes the invention of printing to Coster [Coster], it may be remarked that, whatever may be thought of the external evidence for the story, the account of the invention with which it supplies us is in the highest degree improbable. The date assigned to Coster's experiments cannot, by any straining of Junius's meaning, be carried farther back than the year 1440. We know that long before that time block-printing, both of pictures and of words, was in common use; yet the Haarlem churchwarden is represented as no more indebted for his new idea to that process than if he had never heard of its existence; that is to say, nine-tenths of the whole art of printing being already discovered and in use, this singular genius discovers the remaining tenth, not by availing himself of what had been already done, but by beginning from the beginning in a way of his own, and most unnecessarily discovering the whole over again. Coster must have seen block-pictures and block-books, but these do not afford him a hint; he takes his whole notion of printing from having been accidentally led to cut out some letters in the bark of trees; the letters already properly reversed on the blocks, and actually employed for making impressions, teach him nothing, suggest nothing to him; but he is filled with the idea of the whole process of printing, in its most improved form, including moveable types, by his own carvings in the bark, which really could have no more tendency to suggest any part of the idea than any other characters graven on wood, or stone, or metal, he had ever looked upon, or even than the common writing in a book. Of course, when Coster, in his afternoon walks, made, like Orlando in the play, the trees his books, and charactered his thoughts in their barks, he cut the letters so as that they should present the usual appearance to the eye; if he reversed them, then it was not his operations on the bark that gave him the idea of printing, but the idea of printing previously acquired, and elsewhere derived, that set him to operate on the bark. But the truth is that the maker of this story misapprehended altogether in what it is that the invention of the art of printing consisted; it did not consist in conceiving the employment of inverted characters—that was quite a familiar expedient, as old as the coinage of money or the use of seals, things which had been known for thousands of years; what it consisted in was the application of a pigment to the stamp or seal in a manner, which the stupid story about Coster takes no notice of whatever. The probability is, that Coster was one of the early block-printers, whose art there is every reason to believe, was first practised in Holland. If this art could be proved to have been really invented there, whether by Coster (whose date however is scarcely antient enough) or by some other of his countrymen, and not borrowed from the Chinese, the Dutch would be then entitled to take to themselves the glory of being the true discoverers of printing, and would have little reason to grudge their German neighbours all that they claim as its improvers and perfecters by having been the first to employ moveable types, and matrices and punches.

These mere improvements are all that can be attributed to Gutenberg, Fust, and Schoeffer. Gutenberg, it is now generally supposed, first began to print at Strasburg some time between the years 1436 and 1442. If what he first practised was block-printing, as has been asserted, he was not the inventor of that method, which we know was in use some years before the earliest of these dates. But there is good reason for believing that before he left Strasburg he had begun to print with moveable types of wood. Having then established himself in Mayence, which was his native town, he there, in the year 1445, entered into partnership with Fust, who seems not only to have supplied the capital for carrying on the business, but also to have assisted Gutenberg in devising or carrying into effect his subsequent great improvement of the art, by casting the types of metal. But to Schoeffer, who was in the service of Gutenberg and Fust, and had married Fust's daughter, is assigned the credit of having facilitated and (as far as the principle was concerned) brought to perfection the process of founding by the contrivance of the punch. This is the account of the matter at once most accordant with the words of the only contemporary or nearly contemporary authority, the abbot John Trithemius, in his 'Annales Monasterii Hirsaugiensis,' and best supported by all the facts that have since come to light. Trithemius, who died in 1516 (though his work was not printed till 1690, 2 vols. folio, Monast. S. Galli), professes to have derived his information from a grandson of Schoeffer. It is observable that he expressly attributes the invention of the art to Fust as well as to Gutenberg.

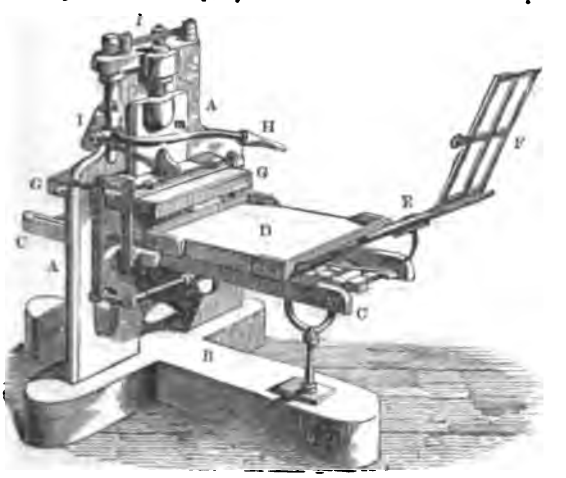
An antient chronicle, first printed at Cologne in 1474 ('Chronica, sive Fasciculus Temporum,' &c., commonly called the 'Cologne Chronicle'), notes that, after ten years had been spent in preparation, the art of printing began to be practised (cœptum est imprimi) in the year 1450. The first book, this chronicle proceeds to state, that was printed was the Bible. Trithemius informs us that before the first twelve sheets of this Bible were printed, Gutenberg and Fust had incurred an expenditure of four thousand florins. The Bible in question is the edition of the Latin Vulgate commonly known by the name of the 'Mazarin Bible,' from a copy of it having been discovered about the middle of the last century in the 'Bibliothèque Mazarine' (ou du Collège des Quatre Nations) by the bookseller De Bure, who has given a minute description of it in his 'Bibliographie Instructive' (vol. i., pp. 32-40). Many other copies of the book however have since turned up. It is without either date or printer's name, but it appears to have been completed before 1455. For some time the new art is said to have been kept secret, and a story is commonly told of the copies of this very edition of the Bible having been sold for several years at Paris as manuscripts; but this anecdote is neither very probable nor very well authenticated. Gutenberg, Fust, and Schoeffer appear to have printed in partnership till the year 1455, when Gutenberg quarrelled with the other two, who then carried on the business by themselves, while he set up a new press, also in Mayence. The knowledge of the art was first made public and carried into other countries by the dispersion of many of the workmen on the storming of Mayence by Adolphus of Nassau, in 1462. Printing was first practised in Italy, in the town of Subiaco, in the Roman territory, in 1465; in France, at Paris, in 1469; in England, at Westminster, in 1474; and in Spain, at Barcelona, in 1475. It is said that by the year 1500 there were already about 200 printing-presses in Europe.

Among the principal works upon the invention and history of printing, are—Bern. à Malinkrot, 'De Ortu et Progressu Artis Typographicæ,' 4to., Colon. Agrip., 1639; Jac. Mentelli 'De Typographiæ Origine Parmensis,' 4to., Paris, 1650 (this is an assertion of the claim of the author's ancestor of the same name); J. de la Caille, 'Histoire de l'Imprimerie,' 4to., Paris, 1689; And. Chevillier, 'L'Origine de l'Imprimerie de Paris,' 4to., Paris, 1694; Fra. Pellegrino Antonio Orlandi, 'Origine e Progressi della Stampa,' 4to., Bologna, 1722; Jo. Ch. Wolfii 'Monumenta Typographica,' 2 tom., 8vo., Hamb., 1740; Pros. Marchand, 'Histoire de l'Origine et des Progrès de l'Imprimerie, 4to., La Haye, 1740; Mich. Maittaire, 'Annales Typographicæ,' 5 tom., 4to., Hag. Com., Amstel., et Lon., 1719-1741; P. S. Fournier, 'Dissertation sur l'Origine de l'Imprimerie,' 8vo., Paris, 1759; Jo. Dan. Schœpflini 'Vindiciæ Typographicæ,' 4to., Argentor., 1760; Gerardi Meerman, 'Origines Typographicæ,' 2 tom., 4to., Hag. Com., 1765; Ch. Hen. Baron Heinecken, 'Idée Générale d'une Collection complete d'Estampes,' 8vo., Leips., 1771; Pi. Lambinet, 'Recherches sur l'Origine de l'Imprimerie,' 8vo., 1798, and 2 tomes, 8vo., 1810; Singer's 'Researches into the History of Playing-Cards;' Ottley's 'History of Engraving;' Fried. Metz, 'Geschichte des Buchhandels und der Buchdruckerkunst,' Darmstadt, 1834; Falckenstein, 'Entstehung und Ausbildung der Buchdruckerkunst,' Leips. (announced as about to appear in a valuable paper on the 'History of the Book-trade of Germany,' by M. Henry Meidinger, published in the 'Quarterly Journal of the Statistical Society of London' for July, 1840 (vol. iii., part 2, pp. 161-190).

PRINTING-PRESS. The term printing-press is applied to the machine used for letter-press printing or copper-plate printing, but more usually the former. The date of the invention of the printing-press is unknown, but some contrivance for this purpose must have been used as soon as printing by blocks or types was introduced. The increased force requisite to make an impression, the size of the surface to be printed from being increased, would soon suggest recourse to some of the simple machines or mechanical powers for the modification of the power requisite to obtain the necessary pressure. The screw, as applied in the common screw-press [SCREW-PRESS], would obviously suggest itself; and accordingly, in all the earlier printing-presses, the screw alone is used.

The operations to be performed in the process of printing will point out the essential parts of a printing-press. The types, being set up and arranged in a form of suitable dimensions, have to be inked; this is effected by passing across them a cylinder, or roller, covered with an elastic composition of molasses, glue, and tar. The paper to be printed has to be laid on the types when inked, and then the requisite pressure for making the impression has to be applied.

The earliest form of printing-press very closely resembled the common screw-press, as the cheese or napkin press, with some contrivance for running the form of types, when inked, under the pressure, and back again when the impression was made. This rude and inconvenient form of press was superseded by the invention of Blew, a printer of Amsterdam. Other improvements were from time to time introduced; but they were all superseded, about the commencement of the present century, by an invention of Lord Stanhope.



In the accompanying diagram of the Stanhope press, A is a massive frame of iron, cast in one piece, forming the body of the press, and firmly fixed to the cross B, or wooden foundation. The table C carries the form of types D, which, being placed on a carriage, traverses the table backwards and forwards, motion being given to it by means of the crank-handle acting underneath the table. To the carriage are attached the tympans E, which are light frames covered with parchment, and so constructed that the inner tympan just lies within the outer tympan. Some blanketing is placed between the tympans, so as to equalise the pressure upon the surface of the types. To the outer tympan is attached the frisket F. The sheet of paper to be printed being placed on the tympans, the frisket is turned down upon it; and then the frisket and tympans are turned down upon the form of types. The frisket is covered with paper or parchment, cut out so that the sheet to be printed, when placed between the tympans and frisket, and folded down together on the form of the types, may be in contact with the surface of the types; while the remainder of the frisket-sheet preserves the margin from being soiled.

The form of types being inked, and the tympans and frisket, with the sheet of paper between them, folded down on the form, the whole is run, by turning the crank-handle, under the plattin G, which is a massive plate of cast-iron, moveable up and down perpendicularly, its weight being rather more than counterbalanced by the weight I at the back. The pressman pulls the handle of the bar H towards him, or across the press, and thus communicates motion to *k* and *l*, and causes the spindle *m*, which sustains the plattin, to descend and produce the requisite pressure. The principal improvement of the Stanhope press consists in the manner in which the descending motion is given to the screw. This depends on the properties of the bent lever, and may be explained in the following manner:—It is a necessary consequence of the peculiar combination and arrangement of the bent lever here employed, that on the handle H being moved, the plattin descends rapidly at first; but as the plattin comes very near to the extreme point of its descent, the motion is extremely slow. But at this instant the plattin is pressing the paper upon the types, and the pressure exerted being inversely as the rate of the descent of the plattin, whose motion at this instant is exceedingly slow, the pressure produced is enormously large. It will be found also that at the instant the plattin is at its lowest point, the connecting bar *l*, by which the power applied is transmitted to the plattin, passes across the centres of motion of the system of forces; and at this instant, as theory points out, the ratio of the pressure produced to the power applied is indefinitely large. The pull having been made, or the pressure produced, the handle H returns to its original position, being taken back by the weight I at the back, which rather more than counterbalances the plattin. The carriage is then run back, the frisket and tympans unfolded, and the printed sheet being taken out, the same operation is repeated. The usual rate of printing by the Stanhope press is two hundred and fifty per hour, two men being employed, one to ink the types, and the other as pressman.

The principle of the Stanhope press has been followed out by several subsequent inventors, and improvements of mechanical detail introduced, tending to the economy of time and labour, and to precision of workmanship. In the Ruthven press, the form of types remains stationary, and the plattin is removed to permit the types to be inked; and in this, as well as the Columbian, the pressure is produced by a combination of levers alone, without the use of any portion of a screw or inclined plane.

The press for copper-plate printing consists of two cylinders, or rollers, of wood, supported in a strong wooden frame, and moveable about their axes, one placed just above and another just below the level of the table upon which the plate to be printed is laid. The upper roller is turned round by the arms of a cross fixed to its axis. The copper-plate being inked, the paper on which the impression is to be taken, and two or three folds of soft material, as blanketing, are placed upon it. The plate so prepared is moved along the table to the juncture of the two rollers, and the upper roller being turned by the arms of the cross, the plate, with its furniture, is passed through the press. The rollers may be placed nearer to or farther from each other, according to the amount of pressure requisite for making a good impression, that is, according to the depth of the engraving and the degree of blackness which the impression is required to have.

PRINTING-MACHINE. The printing-press, though much improved during the last half-century by the ingenuity of Lord Stanhope and others [PRINTING-PRESS], is quite in-

adequate to a rate of production equal to the present demand. The attention of practical men was consequently directed to some more rapid means of production, and as early as 1790, even before the Stanhope-press was generally known, Mr. W. Nicholson had letters-patent for a machine similar in many respects to those which have now come into use. Subsequently Mr. König, a German, conceived nearly the same idea, and meeting with the encouragement in this country which he failed to obtain on the Continent, constructed a printing-machine, and on the 28th of November, 1814, the readers of the 'Times' were informed that they were then for the first time reading a newspaper printed by machinery driven by steam-power. This printing-machine, though highly ingenious, was very complicated, and the machine of König was soon superseded by that of Messrs. Applegath and Cowper, the novel features of which were accuracy in the register, the method of inking the types, and great simplicity in hitherto very complicated parts. Printing-machines may be distinguished into single and double; the single being that in which only one side of the sheet of paper is printed, the double that in which both sides are printed before the sheet leaves the machine. The former is used for newspapers and that kind of printing in which it is not necessary for the two sides of the sheet to 'register,' that is, for the printing on one side to be exactly at the back of the other; the latter for books, in which it is essential that the printing on one page should correspond with the printing on the other when the sheets are folded. This important object of the register is effected by causing the parts to move at precisely the same speed. This being the principle of the register, its success will depend on great accuracy of workmanship in the mechanical parts. The accompanying representation of the printing-machine will furnish a correct notion of the several parts, and of the way in which motion is communicated to them. A sheet of paper is taken from the pile to be printed (as represented at the left-hand side of the drawing), and put into the machine by one attendant, and taken out printed on both sides by the other attendant, whose hand is shown under the cylinders. The accompanying sketch will show the principle of the printing-machine.

The sheet of paper taken from the table A is laid on the feeder B, which consists of girths of linen, tightly stretched by being passed round two cylinders. By the motion of this feeder the sheet is placed between the two systems of tapes which lie on the cylinder G: these tapes, of which one set is represented by the dotted line, and the other by the thin line, lie two and two over each other on the cylinders and small rollers *a, b, c, d, e, f, g, h, i*. The sheet of paper grasped between them is kept clean at the places in which it is in contact with them, and by the motion of the various parts is conducted under the first printing-cylinder H, and receives an impression from the types at C; thence by means of the cylinders I, K, to the second printing-cylinder L, where it receives an impression on the other side from the types at D. Thus printed on both sides, it is taken out at *e* by the attendant. The cylinders I and K are simply for the purpose of conveying the sheet steadily and smoothly from one printing-cylinder to the other. The sheet will be seen to be reversed in its progress from one set of types to the other, descending the left side of the first and the right side of the second printing-cylinder.

An inking-apparatus is placed at each end of the table M, N, which carries the types C, D, and which traverses backwards and forwards under the printing-cylinders L, H, and inking-rollers. The ink, received from a reservoir *k* by the two rollers *l* and *m*, is transferred from them to the surface of the table; the surface of the table inks the rollers *n, o*, and these, in their turn, ink the types as they pass backwards and forwards for each impression. The excellence of the printing depends in a great measure on the types being properly inked. In a machine arranged according to the accompanying diagram, the types are touched four times by the inking-rollers for each impression, and by increasing the number of rollers, any perfection of inking may be obtained. The machines commonly used for printing books will print from seven hundred to one thousand per hour, in perfect register; and for newspapers, printed on one side only, from four thousand to six thousand per hour.

PRINTING, CALICO. [Calico Printing.]

PRIODON. [Armadillo, vol. ii., p. 354.]

PRION. [Petrels, vol. xviii., p. 47.]

PRIONITES, Illiger's name for a genus of birds.

Generic Character.—Both *mandibles* slightly curved and compressed; the margins with strong denticulations. *Tongue* long, slender; the sides ciliated. *Wings* short, rounded. *Tail* lengthened, cuneated. *Feet* gressorial, as in *Merops*. (Sw.)

Mr. Swainson (*Classification of Birds*) remarks that every writer since the days of Linnæus (who at first actually classed them in the same genus) has placed the Motmots (*Prionites*) and the Toucans (*Ramphastos*) close together, not only from the similarity of their habits, but from the structure of the tongue, which in both is long, and so much ciliated at its sides as to resemble a feather; so far, therefore, he observes, the resemblance is unquestionable. 'But,' continues Mr. Swainson, 'the feet of the motmot are totally different from the toucan; they are not scansorial, but of that particular structure so common among the *Fissirostres*. The toucans, we know, from personal observation, to be gregarious, living in flocks, and seeking their food from the tops of lofty trees; the motmot is solitary, hiding in the deep shades of the forests, and, like other air-feeding birds, is always found sitting nearly motionless. Here, then, is a very obvious departure from the structure and habits of the toucan. The question then is, to what does it lead? If to the hornbills (which has been inferred from the structure of the feet), we should have no diminution in the size of the bill, which in both the hornbills and toucans is equally large, but in the motmot of an ordinary and proportionate size: we should further expect a bird which was gregarious, since both these groups are so. Yet there is nothing in the motmot, beyond its feet, which will at all assimilate it to the perchers; while its fissirostral habit of catching its food upon the wing, and the discovery of the broad-billed species, *Prionites platyrhynchus*, seems to us a conclusive argument for placing this genus in the fissirostral order, as more intimately connected to the Jacamars (*Galbula*) [Kingfishers, vol. xiii., p. 233], than to any other known genus.

Prionites Mexicanus.

Example, *Prionites Mexicanus*.

Description.—Green above, paler beneath; head and neck above crimson; ears black, varied, and tipped with bright blue stripes; belly white. (Sw.)

Food, Habits, Geographical Distribution.—Mr. Swainson (*Ext. III.*) states that the motmots or momots, 'so named from their monotonous note, live only in the tropical forests of the New World, preferring those deep recesses of perpetual shade where a high canopy of matted foliage nearly excludes the rays of a vertical sun. They appear even more solitary in their disposition than the *Trogons*; their note may be heard, morning and evening, from the depths of the forests, but the bird is never seen, unless the hunter comes unexpectedly upon its retreat. This we have generally found to be a low withered branch completely shaded and near to the edge of such paths as are made by the Cavies or the Indians. The *Jacamars* and the *Trogons* both love these shady nooks, where they sit nearly motionless, watching for passing insects, on which they dart. Such is, no doubt, the manner in which the motmot feeds; but his strong conformation enables him to capture larger game. Travellers assert that he also devours the eggs and young of other birds, like the Toucans; this we believe, as both have the same long and feather-like tongue.'

Mr. G. R. Gray makes the *Momotinæ*, a subfamily of the *Todidæ*, consist of the genus *Crypticus*, Sw. (*Momotus*, Lesson; *Prionites*, Sw.), and the genus *Momotus*, Briss. (*Baryphonus*, Vieill.; *Prionites*, Ill.; *Momota*, Shaw; *Ramphastos*, Linn.).

PRIONODON, Dr. Horsfield's name for a feline form (*Felis gracilis*, *Delundung* of the Javanese), and placed by him in a separate section under the name of *Prionodontidæ*, between *Felis* and *Viverra*. (*Zoological Researches in Java*.)

Mr. Swainson remarks (*Classification of Quadrupeds*) that of the genus *Prionodon*, at present, but one species has been found, in Java. As a familiar appellation, expressive, in all probability, of its analogy to the *Sorecidæ*, he terms it the *Shrew Cat*.

Dental Formula:—Incisors $\frac{6}{6}$; canines $\frac{1-1}{1-1}$; molars $\frac{5-5}{6-6}$.

Head, teeth, and feet of Prionodon.
Head two-thirds of nat. size.

[illegible] (Horsfield.)

Mr. Swainson thus enumerates the distinguishing peculiarities of this interesting form as given by Dr. Horsfield:—

"In the number of toes on the hind feet, and of the teeth, as well as in the form of the head and body, this animal resembles the Genetta (*Viverra*), but the character of the claws and peculiar structure of the teeth indicate a decided affinity to the *Felinæ*. Both these families indeed have the canine or cutting teeth alike, and those of the shrew cat are similar; nor does there appear any essential difference in respect to the canine teeth of the three. The cats have three or four cheek-teeth above and three below; the *Viverræ*, on the contrary, have six; while our present animal differs from both, in having five above and six below. The pupil of the eye is circular; that of the genus *Felis* in some instances is the same, but in others oblong; while in the *Civets* it is transversely elongate. In the ears and form of the body, our animal much more resembles the *Viverræ* than the *Felinæ*; but in regard to colour it preserves a much closer relation to the genuine cats. The ears are short and round, the body long, and the legs short. From these facts it appears more natural to associate this singular animal with the present group (*Felinæ*) than with the Viverrine family; inasmuch as although it wears the aspect and possesses some of the characters of the latter, it has others, more important to its economy and habits, which belong only to the *Felinæ*. So far we coincide with the views of those who associate *Prionodon* with the true *Felinæ*. But before this question can be ultimately decided, it is absolutely necessary that the circle of the *Mustelidæ* should be analysed. *Prionodon* may possibly be the type of *Felis*, in the circle of *Viverra*; or it may be, as we esteem it at present, an aberrant form of the group before us (Felinæ).'

Description.—Tail elongated, annulated, cylindrical; body pale flavescent, with four very wide dorsal bands and two narrow anal bands; two broad lateral striæ, the narrow cervical striæ, the numerous humeral and femoral spots, and the seven caudal rings very deep brown. (Horsf.)

Habits, Locality, &c.—Dr. Horsfield discovered this animal in 1806, during the early period of his researches in the district of Blambangan, situated at the extremity of Java; the natives distinguish it by the name above given. Dr. Horsfield was not able to ascertain that it is found in any other part of the island, or that it has another name; but he states that even in Blambangan it is rarely met with. He notices it as inhabiting the extensive forests which, with the exception of the capital of Banyuwangi and a few small villages, cover that district. He obtained but little information as to its habits and manners, and records nothing on the subject beyond what we have mentioned.

Prionodon gracilis. (Horsf., Java.)

PRI'ONOPS. [SHRIKES.]

PRIOR, PRIORY, ecclesiastical terms denoting certain monastic foundations and the heads of such foundations. They differ in nothing essentially from the terms abbot and abbey. There were in England religious houses the chiefs of which were called priors, quite as rich and as powerful as many that had a chief who was called the abbot. Thus in Yorkshire there were two houses at no great distance from each other, called Roche and Nostel, the head of the former being an abbot, and of the latter a prior, though Nostel was the more antient and more considerable foundation. Neither has the distinction respect to the order to which the house belonged; for Kirkstall had an abbot, while Fountains had only a prior, and yet both were Cistercian houses. The prior of Saint John of Jerusalem was equal to any abbot; yet in the main we find the greater monastic foundations presided over by monks who were called abbots, as Glastonbury, Malmesbury, Tewkesbury, and others of ante-Norman foundation. In some cases there was both an abbot and a prior, when the abbot was regarded as the superior officer; and in the priories there was often a second officer called the sub-prior.

PRIOR, MATTHEW, was born on the 21st of July, 1664, it is uncertain whether at Wimborne in Dorsetshire, or in London, in which city his father is said to have been a joiner. His uncle, Samuel Prior, kept the Rummer Tavern near Charing-Cross. Matthew, on the death of his father, was taken charge of by his uncle, who sent him to Westminster school, then under Dr. Busby. When he was well advanced in the school, his uncle took him home with the intention of employing him in his business; but he had the good fortune to attract the notice of the earl of Dorset, who formed so favourable an opinion of his talents, that he sent him, in 1682, to St. John's College, Cambridge, where he was admitted to his bachelor's degree in 1686, and obtained a fellowship. Dryden's 'Hind and Panther' was published in 1786, and Prior, in conjunction with the Hon. Charles Montague, afterwards earl of Halifax, wrote, in ridicule of Dryden's poem, 'The City Mouse and Country Mouse,' which was published in 1687. After the Revolution of 1688, Prior came to London; and was introduced at court by the earl of Dorset, by whose influence he was appointed secretary to the embassy which was sent to the congress at the Hague in 1690, and his conduct gave so much satisfaction to King William, that he made him one of the gentlemen of his bedchamber. On the death of Queen Mary in 1695, Prior wrote an ode, which was presented to the king on his arrival in Holland after her death. In 1697 he was appointed secretary to the embassy which concluded the peace of Ryswick, and the next year filled the same office at the court of France, where he was treated with marked distinction. In 1799 he was at Loo in Holland with King William, by whom he was charged with dispatches to England, and on his arrival was made under-secretary of state, but losing his place soon after, on the removal of the earl of Jersey from the office of secretary of state, he was made, in 1700, one of the commissioners of trade. This year he published a long and elaborate poem, the 'Carmen Seculare,' in which he celebrates the virtues and heroic actions of King William.

In the parliament that met in 1701, Prior sat as member for East Grinstead. Soon after this he joined the Tory party. In 1706 he celebrated the battle of Ramillies, in a long ode, which he inscribed to Queen Anne. In July, 1711, the Tories being now in power, Prior was sent privately to Paris with proposals of peace. In about a month he returned, bringing with him the Abbé Gualtier, and M. Mesnager, one of the French ministers, who was invested with full powers. The queen's ministers met Mesnager privately at Prior's house on the 20th September, 1711. This private meeting was made the ground of the charge of treason which the Whigs afterwards brought against Prior. The conferences began at Utrecht, on the 1st of January, 1712, but the business advanced so slowly that Bolingbroke was sent as ambassador to Louis XIV. at Paris, to forward it, and Prior either accompanied or followed him. After Bolingbroke's return, Prior acted as ambassador, though he was not officially appointed till August, 1713; his public dignity however was of short duration, for on the 1st of August, 1714, the Tories lost office, and Prior was recalled by the Whigs, by whom he was committed on a charge of high treason, and remained in custody two years. During his confinement he wrote his poem of 'Alma.' He was now without the means of subsistence, except from his fellowship, which he still retained; but the publication of his poems by subscription, which amounted to 4000 guineas, and an equal sum added by Lord Harley, son of the earl of Oxford, for the purchase of Down-hall in Essex, which was settled upon Prior for his life, restored him to easy circumstances. He died at Wimpole, a seat of the earl of Oxford, in Cambridgeshire, September 18, 1721, at the age of 57. A monument was erected to him in Westminster Abbey; and for this and the Latin inscription upon it, which he directed in his will to be written by Dr. Robert Friend, he left 500*l.*

Prior seems to have been well fitted for the public situations which he filled. It is evident that he was skilled in the art of pleasing, an important requisite in a diplomatist. He secured the approbation of the English sovereigns and ministers who employed him, and his influence at the French court was undoubted. When he joined the Tories he became, as is usual in such cases, a violent partisan; and the charge of high treason and two years' imprisonment were the result of a malignant persecution to which he had exposed himself by his desertion of the Whigs.

In his private habits he appears to have been negligent and sensual. It is stated, on the authority of Spence, that the woman with whom he lived was 'a despicable drab of the lowest species.' It is evident however that he secured the esteem and affection of a large circle of associates; he became indeed almost a member of the family of the earl of Oxford.

Prior, as a poet, was once popular, but is little read now. His lighter pieces are the most attractive. His Tales, though borrowed and mostly indecent, are told with ease and sprightliness, and his Epigrams are often neatly pointed. His 'Alma, or the Progress of the Soul,' the style of which is professedly an imitation of that of 'Hudibras,' has not much either of philosophy or wit in it, but is written in a very lively manner. 'Solomon' is one of the best of his poems. It is a sort of epic, formed out of the 'Proverbs' and 'Ecclesiastes.' The reflections are elaborately expressed, and often with great felicity of diction, but being without character or incident, it is rather heavy reading. 'Henry and Emma' is displeasing from the improbability both of the circumstances and sentiments; yet it was once a favourite with the public. Johnson very truly calls it a 'dull and tedious dialogue.' His smaller occasional poems are deformed by the continual introduction of the deities of the Grecian and Roman mythology. Venus and Cupid and Mars and Mercury and Jupiter meet us at every turn. Prior is fortunately one of the last of that race of poets who sought for ornament in these school-boy allusions. On the whole, it may be said of Prior that he had none of the higher qualities of a poet—no invention, little power of imagination, and consequently no vividness of description. He has diligence and judgment, and he may be regarded as one of the most correct of English poets. A 'History of the Transactions of his own Times,' for which he had been collecting materials, was published after his death, in 2 vols. 8vo., but it has little in it of Prior's, and is of small value.

(Johnson's *Lives of the Poets; Life of Prior*, by Humphreys; *Biographie Universelle;* Campbell's *Specimens of the British Poets.*)

PRIORITY. [NOTICE.]

PRISCIA'NUS was a celebrated Roman grammarian, who is said to have been born at Cæsarea; but we have hardly any particulars respecting his life. It appears that he was appointed professor of grammar at Constantinople in the reign of Justinian, about A.D. 525 (Fabricii *Biblioth. ca Latina*, vol. iii., p. 398, ed. Ernesti); and we may infer from this circumstance, as well as from several passages in his works, that he was a Christian. He received instruction himself from Theoctistus, whom he frequently mentions with great praise.

Priscian's work 'De Arte Grammatica' is comprised in eighteen books, and is dedicated to Julian, whom some modern writers have erroneously supposed to be the emperor of that name. This work, which is the most complete treatise on the Latin language that has come down to us from antiquity, supplied the materials for most of the Latin grammars published at the revival of learning; and the estimation in which it was held at that time is shown by the fact that five editions of it were published between the years 1470 and 1495. Modern scholars may still consult it with profit; it is particularly valuable for the number of quotations which it contains from writers whose works have not come down to us. Besides this work, the following treatises of Priscian's are extant:—'De XII. Versibus Æneidos principalibus ad Pueros,' 'De Accentibus,' 'De Declinatione Nominum,' 'De Versibus Comicis,' 'De Præexercitamentis Rhetoricæ,' 'De Figuris et Nominibus Numerorum et de Numis ac Ponderibus.' The best editions of Priscian are by Putschius, in his 'Grammaticæ Latinæ Auctores antiqui,' 4to., Hanov., 1605, and by Krehl, 8vo., Lips., 1819-20. The 'Opera Minora' were also edited by Lindemann, 8vo., Lugd. Bat., 1818. His treatise on Comic Metres is included in Gaisford's 'Scriptores Latini Rei Metricæ,' 8vo., Oxon., 1834.

Priscian also wrote a short poem entitled 'De Laude Impositione Amoris,' which was published for the first time in Wandsbeck, 8vo., Vienna, 1828.

PRINCIPIATURE. [Order, Holy.]

PRISM (πρίσμα), in Mathematics, is a solid formed by a straight line which moves parallel to a given straight line, and one end of which traces out the contour of a given rectilinear polygon. The other extremity of the moving straight line traces out an equal and similar polygon, placed parallel to the former one; and the prism is thus bounded by two equal and parallel polygons, joined by as many parallelograms as each polygon has sides. When these parallelograms are at right angles to the planes of the polygons, the solid is called a right prism; in all other cases, an oblique prism. The prism is among plane solids what the cylinder is among curvilinear ones: it is also called triangular, quadrangular, pentagonal, &c., according as the polygons have three, four, five, &c. sides. Thus the prism used in optics is a triangular prism, while the parallelopiped is a quadrangular prism.

The number of cubic units in the content of a prism is found by multiplying the number of square units in either of the polygons by the number of linear units in the perpendicular distance between the planes of the two polygons; and all prisms, however much they may differ in obliquity, which have equal bases and equal heights or perpendicular distances between opposite polygons, are equal in magnitude.

No other rule can be given for computing the surface of a prism except the simple direction to add the areas of the two polygons to those of the joining parallelograms. But in the case of a right prism, the finding of the parallelograms may be shortened by multiplying the number of linear units in the contour of one polygon by the altitude of the prism.

PRISM (Optics). [Refraction.]

PRISTIDON, Schumacher's name for a form among the Naiades, Hyria, Lam. of authors. [Naiades.]

PRISON. [Transportation.]

PRISTIDACTYLS, the name assigned by MM. Duméril and Bibron to a group of Geckotians, being the second of their Lézards Lacertiens ou Autosaures. The Lacertians of this group are those which have the toes either dentilated laterally or carinated on their inferior surface, or provided both with carinations below and dentilations along their edges. None of them have the supplies covered with plates or large scales. In the greater part of the species the plates which surround the nostrils are more or less convex, the palpebral disk is nearly completely surrounded with a cordon of granules, and the ventral lamellæ, as well as the preanal scales, are smaller and more numerous than in the Leiodactylian Geckotians.

The following genera are arranged by MM. Duméril and Bibron under this group:—

Psammodromus, Fitz. (Notopholis, Aspistis, Wagl., Bonap.; [illegible]; Psammuros, Wiegm.)

[illegible] [illegible] (Amyslos, Wiegm.). [Ophiops.]

Calosaura, Dum. and Bib.

Acanthodactylus, Fitz. (Podarcis, part, Wagl.).

[illegible], Fitz. [Scapteira.]

[illegible], Fitz. (Podarcis, part, Wagl.).

PRITTLEWELL. [Essex.]

PRIVAS, a town in France, capital of the department of Ardèche, situated on the little river Ouvèze, 359 miles from Paris by Lyon and Valence, in 44° 44′ N. lat. and 4° 35′ E. long.

This small provincial capital is on a hill rising out of a pleasant valley. It has few public structures of any importance. There are an old castle, and a convent of Recollet friars, now converted partly into a court of justice and partly into barracks. The population of the commune in 1831 was 4244. The townsmen are engaged in throwing and manufacturing silk, and carry on trade in leather. There are coal-mines in the neighbourhood. Privas has a subordinate court of justice, several fiscal government offices, a house of correction, a library, and an agricultural society. The town was taken from the Huguenots, A.D. 1629, by Louis XIII.

The arrondissement of Privas had, in 1831, a population of 107,130. It comprehends 107 communes, and is divided into ten cantons or districts, each under a justice of the peace.

PRIVATEER, a private ship of war, fitted out at the cost of an individual for the purpose of carrying on hostilities on his own account, but under the sanction of a belligerent state, against the public enemy. It is the practice of most nations to commission vessels of this kind as auxiliaries to the public force. The owners of them are licensed to attack and plunder the enemy, and their enterprise is encouraged by allowing them a large portion of any property they may capture. By the law of nations they are not considered pirates. It is usual for the country on whose behalf they carry on war to take security for their duly respecting the rights of neutrals and allies, and observing generally the law of nations. [Prize.] (42 Geo. III., c. 72; 1 Kent's Commentaries, 96.)

PRIVILEGE (Privilegium, from the sense of which however it has been perverted), a particular beneficial exemption from the general rules of law. Privilege is of two kinds; real, attaching to place, and personal, attaching to persons, as ambassadors, peers, members of parliament, attorneys, &c., whose peculiar privileges are stated under these heads respectively.

Formerly many places conferred the privilege of freedom from arrest, even in criminal matters, upon those entering them [Sanctuary]; and even in later times many places existed which privileged those within them from arrest in civil suits. Of these the most notorious were White Friars, the Savoy, the Mint, and other places in their neighbourhood. But by 8 & 9 Will. III., c. 27, the privileges of all these places were abolished. However, at the present time, no arrest can be made in the king's presence, nor within the verge of the palace of Westminster, nor in any palace where he resides, nor in any place where the king's justices are sitting. (3 Inst., 141.) Personal privilege, conferring freedom from arrest, is enjoyed by all suitors, counsel, witnesses, or other persons attending any courts of record upon business, or an arbitrator under a rule of Nisi prius. This exemption is to be interpreted liberally, and will not therefore be forfeited by taking refreshment after a suit, or by going other than the direct road to or from a court. (Com. Dig., tit. 'Privilege.')

PRIVILE'GIUM. [Law.]

PRIVY COUNCIL (Concilium regis privatum, consilium secretum et continuum concilium regis). The privy council, or council table, consists of the assembly of the king's privy councillors for matters of state. During the existence of the Star-chamber, the members of the privy council were also members of that court. Their number was anciently about twelve, but is now indefinitely increased. The present usage is, that no members attend the deliberations of the council who are not especially summoned for that purpose. They must be natural-born subjects of England, and are nominated by the king without any patent or grant. After nomination and taking the oath of office, they immediately become privy councillors. Formerly they remained in office only during the life of the king, who chose them, subject to removal at his discretion; but by 6 Anne, c. 7, the privy council continues in existence six months after the demise of the crown, unless sooner determined by the successor, and they are to cause the successor to be proclaimed. The privy council of Scotland is now merged in that of England, by 6 Anne, c. 6. The duties of a privy councillor, as stated in the oath of office, are, to the best of his discretion truly and impartially to advise the king; to keep secret his counsel, to avoid corruption, to strengthen the king's council in all that by them is thought good for the king and his land, to withstand those who attempt the contrary, and to do all that a good councillor ought to do unto his sovereign lord. By the Act of Settlement (12 & 13 Will. III., c. 2) all matters relating to the government properly cognizable in the privy council are to be transacted there; and all the resolutions taken thereon are to be signed by such of the privy council as advise and consent to them.

The court of privy council is of great antiquity; and during earlier periods of our history appears not always to have confined itself to the entertainment of mere matters of state. It had always and still has power to inquire into all offences against the government, and to commit the offenders for the purpose of their trial in some of the courts of law; but it often assumed the cognizance of questions merely affecting the property and liberties of individuals. This is evident from the complaints and remonstrances that so frequently occur in our history, and ultimately from the declaratory law of the 16 Ch. I. referring to such practices. Probably the very statement of Sir Edward Coke, that the subjects of their deliberation are the 'publique good, and the honour, defence, safety, and profit of the realm....private causes, lest they should hinder the publique, they leave to the justices of the king's courts of justice, and meddle not with them,' proceeded from his knowledge that such limits had not always been observed, and his jealousy of their invasion. Several other passages in his works seem to show that this was so. These encroachments, in one arbitrary reign, received the sanction of the legislature. By 31 Hen. VIII., c. 8, the king, with the advice of his privy council, was empowered to set forth proclamations under such pains and penalties as seemed to them necessary, which were to be observed as though they were made by Act of Parliament. It is true there was an attempt to limit the effects of this, by a proviso that it was not to be prejudicial to any person's inheritance, offices, liberty, goods, or life. The statute itself however was repealed in the first year of the ensuing reign. The king, with the advice of his council, may still publish proclamations, which are said to be binding on the subject; but the proclamations must be consonant to and in execution of the laws of the land. The attempts to enlarge the jurisdiction of the council appear always to have been resisted as illegal; and they were finally checked by the 16 Chas. I., c. 10. That statute recites that of late years 'the council-table hath assumed unto itself a power to intermeddle in civil causes, and matters only of private interest between party and party, and have adventured to determine of the estates and liberties of the subject, contrary to the laws of the land, and the rights and privileges of the subject.' By the same statute it is declared and enacted that neither his majesty nor his privy council have or ought to have any jurisdiction in such matters, but that they ought to be tried and determined in the ordinary courts of justice, and by the ordinary courts of law.

Subsequently however to this statute, in matters arising out of the jurisdiction of the courts of the kingdom, as in colonial and admiralty causes, and also in other matters, where the appeal was to the king himself in council, the privy council continued to have cognizance, even though the questions related merely to the property of individuals. By 2 and 3 Wm. IV., c. 92, the powers of the high courts of delegates, both in ecclesiastical and maritime causes, were transferred to the king in council. The decision of these matters being purely legal, it was found expedient to make some alterations in the court, for the purpose of better adapting it to the discharge of this branch of its duties. Instances had before occurred where the judges had been called in and had given extra-judicial opinions to the privy council; but the practice was inconvenient and unsatisfactory, and all necessity for it is now wholly removed. By the 3 and 4 Wm. IV., c. 41, the jurisdiction of the privy council is further enlarged, and there is added to it a body entitled 'the judicial committee of the privy council.' This body consists of the keeper of the great seal, the chief justice of the King's Bench and of the Common Pleas, the master of the rolls, the vice chancellor, the chief baron of the Exchequer, the judges of the prerogative court of Canterbury and of the high court of admiralty, the chief judge of the bankruptcy court, and all members of the privy council who have been presidents of it or have held the office of chancellor or any of the before-named offices. Power is also given to the king by his sign manual to appoint any two other persons who are privy councillors to be members of the committee. In the third section of the act are enumerated the appeals which are to be referred to this committee. They are authorised to examine witnesses on oath, and to direct an issue to be tried by a jury. The same powers for enforcing their decrees, &c. are given to the judicial committee as are possessed by the Court of Chancery, King's Bench, &c. A registrar is also attached to the committee, to whom matters may be referred, as in chancery to a master.

The privileges of a privy councillor, beyond those of mere honorary precedence, formerly related to the security of his person. If any one struck another a blow in the house or presence of a privy councillor, he was fineable. Conspiracy by the king's menial servants against the life of a privy councillor was felony, though nothing were done upon it. And by 9 Anne, c. 16, any unlawful assault by any person on a privy councillor in the execution of his office was felony.

These statutes have however been now repealed, by 9 Geo. IV., c. 31, and any offence against a privy councillor stands on the same footing as offences against any other individual. (1 Co. Lit., 110, a, n. 5; 3 *Inst.*, 182; 4 *Inst.*, 52; 1 Bl., *Com.*, 222; Hallam's *Constitutional History*.)

PRIZE, property taken from an enemy. The term is generally applied to property taken at sea exclusively. The law of prize is regulated by the general law of nations. As between the belligerent powers themselves, the property in a ship or other thing captured passes at once, by the mere taking itself, to the captor. But the thing captured may be purchased from the captor by a person belonging to a neutral state, or it may be recaptured. It becomes therefore necessary, as between the original owner and such purchaser, or between the original owner and the recaptor, to lay down some rule for determining at what time and under what circumstances the thing captured becomes prize, so that the property in it passes to the captor for all purposes. The law of nations upon this point was very vague and unsettled. It used to be said that property was not devested by capture until after possession had been retained twenty-four hours, or until the prize had been taken infra præsidia; or again, until the spes recuperandi was gone. The present rule is thus expressed by Lord Stowell:—'By the general practice of the law of nations a sentence of condemnation is at present deemed generally necessary, and a neutral purchaser in Europe during war looks to the legal sentence of condemnation as one of the title-deeds of a ship, if he buys a prize vessel.' Sentence of condemnation, that is, sentence that the thing captured is prize, and that consequently the property of the original owner in it is entirely devested, must be pronounced by a court of the capturing power duly constituted according to the law of nations. The prize court of the captor may sit in the territory of an ally, but not in that of a neutral. Questions of prize are by the English law disposed of in the courts of Admiralty. [ADMIRALTY.]

(45 Geo. III., c. 72; 1 Kent's *Commentaries*, 100; Douglas's *Reports*, p. 612.)

PRIZE-MONEY. All the acts relating to army prize-money have been repealed by the 2 and 3 Wm. IV., c. 53, which also enacts that all captures made by the army shall be divided according to such general rule of distribution as the king shall direct.

PROBABILITY, PROBABILITIES, THEORY OF. A conclusion may be said to be known in two distinct ways: first, when it is derived from those principles (as we call them) which may be considered as common to all mankind, or which at least no one is found to deny; secondly, when it results, by a sure process of inference, from premises which are believed to be known. Whether these premises are properly known, that is to say, whether another person assuming to decide on the propriety or impropriety is satisfied or not, is not a part of the present inquiry. That knowledge of the first kind exists is unquestioned, and most of the results of such knowledge are agreed upon. That knowledge of the second kind exists is also unquestioned, though two men may differ as to whether a given conclusion is part of it or not. The distinction, as elsewhere noticed [MATHEMATICS], is positive, easily apprehended, and useful; it exists moreover, and must exist, whatever may be the system of metaphysics on which one man or another may explain it.

In the exact sciences, demonstration is always effected in such a way as to show that nothing contradictory of the proposition demonstrated either is true or can have been true at any time. Two sides of a triangle are, were, and always will be, greater than the third; by which we mean that persons with minds constituted as ours are, must have admitted this, must now admit it, and must admit it in all time to come. Those who should deny the proposition must really hold that a whole may be less than its contained part: such is the alternative which geometrical demonstration offers for acceptance, and we should cease to consider a mind as the proper object of instruction which should prefer the alternative to the proposition. Such truths as these are not the subject of the present article.

The other class of conclusions consists of those which may be false, or which may have been false at one time, or may become so, without the necessity of our supposing an absolute and inconceivable difference of mental constitution between ourselves and the person who may have seen this falsehood, may now see it, or is to see it. Many such conclusions appear to be as certain as if they were absolutely demonstrated, until a close and (to those who have not considered the subject) a captious test is applied, which shows that this certainty is not what is called mathematical certainty. One of the most certain perhaps of all is true: a ball of iron suspended by a thread will fall to the ground when the thread is cut; every one is as well persuaded of this truth as of the two sides of a triangle being together greater than the third: those who have not studied geometry know the former much better than the latter. But let any one assert that he has seen, in a part of Africa unexplored except by himself, a ball of iron suspended in the air, which, though iron to the touch and iron to every chemical experiment, not only remains in the air without support, but, when forced to the ground, rises again of itself to the same height. We should laugh and disbelieve it, but we could not disprove it; in spite of our laughter and unbelief, we may not know such a thing to be false. Let a number of credible persons solemnly declare that they have seen the same phenomenon, and our unbelief would be shaken: finally, let it be matter, as it is called, of common notoriety, and let a continual succession of good witnesses passing and repassing, mutually confirm each other in the detail above mentioned, and our positive disbelief would be changed into as positive a belief. But let a new witness declare that the natives use bows and arrows of the common form, in which the straight string of the bow, meaning that part of it which joins the extremities of the bow, is four or five times as long as the curved bow itself; though our disbelief of this new witness would not be assuredly stronger than our disbelief of the first witness in the preceding case, yet it would be of this kind, that any succession of respectable witnesses, however numerous, could never add any force to the fact in a mind which can properly appreciate the grounds of the assertion that a straight line is the shortest distance between the two points. A million of witnesses would do no more than one to establish the fact stated, in the mind of a person who knows what geometrical demonstration is; though it is just possible that another, who only learns the connection of the sides of a triangle from experiment, may be capable of being convinced of the second assertion by evidence, as well as of the first.

The *probability* of an asserted fact or conclusion means, in common language, the degree of belief which we think we ought to accord to it, and it depends in each mind upon the amount of evidence offered, the degree in which that evidence is understood, the fitness of that mind to receive and be acted on by evidence, and in particular by the evidence which is offered. Evidence insufficient, as all understand, or offered to a mind which is unduly credulous or sceptical, whether as to the particular sort of evidence in question or to evidence in general, may give a low degree of probability, or none at all, to what another mind considers as indisputable; or the contrary. In the common use of the word, a result is said to be probable only when the mind inclines more or less to believe it, and improbable in the contrary case. The mathematical use of the term is rather different; but, till further notice, we retain the common signification.

We mean by evidence, in the present inquiry, not merely oral or written testimony, but everything which disposes the mind, however little, to adopt or reject, including even the effect of previous knowledge. The value of evidence, that is, the extent it should go towards inducing belief, is really the subject of inquiry in a branch of exact science known by the name of the *theory of probabilities.* But how can the value of evidence be made a subject of measurement? why can this be done in the case of an amount of credibility more than in that of an amount* of benevolence, courage, or talent? We should assuredly think any one would be in a curious delusion who should suppose himself to have ascertained, from the data given by Homer, that the warlike skill of Achilles was exactly 582 times that of Thersites, and that Shakspere had done the former a foul wrong, for that he had made it only 537 times and a fraction. But what is the difference, in the nature of the inquiry which is to be instituted, between attempts to measure prowess and probability? On the mode of answering this question it depends whether we are to make our subject merely, as its enemies, a kind of artificial method of judging the chances of a game of hazard; or, a rational and exact mode of doing, where data are sufficient, that which we daily attempt to do, as well as we can, with our inaccurate appreciations of the circumstances of common life, and a system to be used, as are others of a mathematical nature, for accustoming ourselves to estimate or guess with something like accuracy, by habitual acquaintance with cases in which absolute accuracy is attainable.

When we consider all the circumstances which affect belief or opinion, both those which are external and those which depend on the mind which is exposed to them, it may well bewilder the imagination of a person not accustomed to the idea, when he hears of an attempt to reckon credibility in numbers, and to deduce what are called exact conclusions from hypotheses as to the force of assertions. To remove from the threshold of the subject the incredulity which must exist and ought to exist, in the first instance, let us suppose the other branches of science presented to a student not in their simple beginnings, but by a description of their ultimate physical objects. To put this inquirer in a state parallel to that of readers in general with respect to the subject of probabilities, he must be of mature age, with very little knowledge of number, none of any other branch of mathematics, and no conception of the construction or use of any philosophical instrument, nor of the object and procedure of any one experiment. He might then be addressed as follows:—'You are, without moving from this earth, to track the motions of all the heavenly bodies, to be able to ascertain where they were or will be at any moment of time past or future, to measure their sizes, to weigh their contents, and to find the species and amount of insensible forces which, by some unknown means, they exercise on one another. You are to detect the existence of a subtile fluid which can neither be seen, heard, nor felt, to measure vibrations of which there are millions in a minute, and to trace the course of effects which travel hundreds of thousands of miles in a second. You are to weigh against each other atoms of matter of which it cannot be shown that millions put together would be visible to the eye.' The person so addressed would not be less bewildered nor more disposed to treat the proposed results as fictions, than he who hears for the first time of a numerical theory of probabilities. But let us now reverse the method, and suppose the learner allowed to begin at the beginning. He first finds that, step by step, his rude notions of number are organized into a method of computation which enables him easily to perform more than he could have imagined the most subtle brain to have devised. From notions of the simplest kind connected with space, properties of figure become almost intuitive, of which he could at one time not have comprehended the description, far less the demonstration. By reasoning on the simplest properties of matter, such as can be proved to his senses, he finds no difficulty in tracing remote and complicated combinations of effects from the plainest causes, by which he learns to invert this process, and to reduce observed combinations to their simplest elements. But if, during this long and very gradual process, he were to keep continually before his mind those great results the knowledge of which he had been promised, looking to arrive at the fulfilment of the promise by some sudden acquisition of power, his whole course would be one of disappointment. He would be peeping forward a few pages in his Euclid, in hopes of seeing himself almost arrived at the means of calculating an eclipse or explaining the theory of colours, and would find that he was to learn how to make a square equal to a given figure instead.

Now the application of the preceding description to our present subject is as follows:—The beginner in exact science has usually no definite notions as to the end which he is to arrive at; nor do the terms algebra, geometry, mechanics, &c. suggest any associations beyond a vague notion that they are parts of a learned system. But it is impossible that the beginner in the subject of this article should be without an explicit and probably an exaggerated notion of what he is to attain. There is no unknown Greek or Arabic term the meaning of which must be slowly learned by the study of the science of which it is the name; the word *probability*, as well known in the common affairs of life, stares him in the face at the head of every page, and reminds him to be dissatisfied with the extent of power gained, up to the point at which he has arrived. Unless then he can make up his mind to descend, as a student would do who, having in his head the theory of gravitation

* [illegible]

and the laws of light, should lay by these grand ideas, and set himself to trace the consequences of the simple notion that two straight lines cannot enclose a space—he must be warned that he will be likely to quit the subject in disgust. We now proceed to the fundamental points of the theory.

That opinion may be formed with more or less strength, particularly when the subject-matters are of different species, is well known to every one from his own experience. The most decided republican in England, for instance, is not so sure of the wisdom of the Long Parliament as he is that all its members are now dead; and no royalist, however well persuaded of his tenets, thinks the Restoration was of as much consequence to this country as sun, wind, and rain. It matters nothing that the different degrees of assurance refer to very different matters, and are obtained in very different ways; that they are separate amounts of the same kind of feeling is universally felt and admitted. To make something like a gauge for these degrees of belief is not difficult; to apply it is a harder task, seeing that the cases which present circumstances of sufficiently definite character are seldom met with.

Suppose a box to contain 3 white and 4 black balls; it is easily admitted that it is more likely that a black ball should be drawn than a white one, on the supposition that the drawer does not see the balls. Or rather we should say it is easily admitted that every well regulated mind *ought* to think a black ball more likely than a white one: and that if any one should imagine the contrary, he has formed an opinion from prejudice, fancy, or want of proper consideration. Just as we should say that if all the balls were black, a black ball would certainly be drawn, so when a majority of the balls is black, and each one ball is as likely to be drawn as any other, there are more ways of drawing black than white, and we look upon the former as more obtainable, and more likely to be obtained, than the latter. Common experience makes us consider the black as more likely than white, when the number of black balls is much greater than that of white balls; as, if there only 3 white balls, and a million of black ones. Here, as in other questions of magnitude, we can see a difference when the difference is great, which we must perhaps learn to see when it is small: it is plain enough that the black is more likely than the white when there are a million of black balls to one white; but not so easily grasped that the black is more likely than the white when there are five hundred thousand and one black balls to five hundred thousand white.

The next step to be made is the assertion that when there are 3 white and 4 black balls, the probability of drawing white is to that of drawing black in the proportion of 3 to 4; that is, if we could by a voluntary act make our impressions of the probability of future events of that strength which our reason tells us they ought to have, we should choose to expect a black ball more strongly than a white one in the proportion of 4 to 3. The principle on which we do this is the main point of the theory, the only objectionable part, if there be one: for all the rest is mathematical deduction.

The principle is as follows:—When any number of events, A, B, C, &c., are such that one and only one can happen at a time, and when a, b, c, &c. are the numbers of ways in which they can severally happen, the probabilities of the several events are in the proportions of the numbers a, b, c, &c. Returning to the preceding simple instance, we have an obvious negative reason for supposing that the probabilities should be as 4 to 3, since there is no imaginable ground for assuming, while the excess of black balls is the sole cause of the superior probability of drawing one of them, that this excess of probability should be in any other proportion than that of the excess of black balls. If we grant the following, namely, that the probability of having one or other out of two of the different results which a trial may give, is, or ought to be, the sum of the probabilities of the two separately, we shall be obliged to admit positive reason for the preceding principle, as follows:—Suppose a box to contain 10 balls, marked 1, 2, &c. up to 10, and no others. A ball is to be drawn, and the drawer has in his mind an amount of hope, fear, or simple admission of possibility, as the case may be as to the happening of each number. If the drawing of No. 1 be to gain him a prize, there is a certain amount of hope; if it be to procure him a loss, of fear; if neither one nor the other, of feeling that No. 1 may be that which is drawn. Now let either 1 or 2 bring the gain or loss; is the feeling of hope or fear doubled in strength? or rather, *ought* it to be doubled? He who admits this, admits the whole theory of probabilities, for all the rest is mathematical deduction. Let x be the proper numerical measure of the probability of drawing 1, or of drawing 2, &c.; these probabilities being equal, since there is, by the hypothesis, nothing to render one more likely than the other. Then, if the preceding be admitted, $2x$ is the probability that either 1 or 2 is drawn; $3x$, that either 1, 2, or 3 is drawn; and so on up to $10x$, which is the probability that one or other of the set 1, 2, 3, ... 10, shall be drawn. But since that a drawing shall take place is an absolute condition, one of the ten numbers must be drawn; hence x must be so taken that $10x$ shall be the numerical measure of certainty. It is indifferent what number is taken to stand for the exponent of certainty, as far as principles are concerned; but in a mathematical point of view, unity is more convenient than any thing else. Let unity be adopted, then $10x=1$, or $x=\frac{1}{10}$. Hence the chance of drawing, say one of the three, 1, 2, 3, is $\frac{3}{10}$; and that of drawing one of the remaining 7 is $\frac{7}{10}$. If then the first three should be white balls, and the last seven black, the chance of a white ball is $\frac{3}{10}$, that of a black one is $\frac{7}{10}$; and a black ball is more likely than a white one in the proportion of 7 to 3, which being an inequality in the proportion of $2\frac{1}{3}$ to 1, the *odds* are said to be $2\frac{1}{3}$ to 1 in favour of a black ball, or against a white one. By this we do not mean that every man *does*, in such a case, look for a black ball with an expectation $2\frac{1}{3}$ times as great as his expectation of a white ball, but that, if he *could* measure the strength of his own feelings and adjust them with mathematical precision, he *would* proportion the strength of the two expectations in the preceding manner. And if money were to be spent upon the expectations, he may as reasonably give £$2\frac{1}{3}$ for a black ball, before it appears, as £1 for a white one.

It thus appears that the theory of probabilities is simply the reduction to numerical estimation, in cases which are perfectly known as to the number of events which may happen, of our comparative right to expect one or another event in preference to the rest. In the events of common life, we make estimations of this comparative right, but not *numerically*, because we are not in sufficient possession of the events which might have happened instead of the one which does happen. In such terms as barely possible, very unlikely, improbable, not improbable, as likely as not, rather likely, highly probable, almost certain, &c. we see a gradation which amounts to a rough attempt to make those comparisons which might be made numerically if the proper data could be obtained. The truth is, that almost every one naturally admits and practises the fundamental principles of this theory, though often, it may be, unskilfully. But it is not to be imagined that persons in general make an investigation like the preceding, nor indeed any investigation at all: how is it then that not only are these principles acquired, however imperfectly, by the majority of mankind, but the mathematical results which are obtained by those who professedly study the subject, are received almost universally; inasmuch that not only are they felt to be agreeable to common sense in a great majority of cases, but they are soon admitted to be sufficient indications that common sense is wrong, in the few cases in which they at first appear repugnant to it? The answer to this question leads to another view of the subject.

We all find, by every-day observation, that whenever an event of one kind happens permanently more often than one of another kind, there exists some reason for such frequency of occurrence, which, had it been inquired into before any event happened, would have enabled us to predict the frequency in question. So much is this the case, that if we were to take an observer to an urn in which were black and white balls, but how many of each he is not told, and were to make 1000 drawings, replacing the ball drawn after each drawing, and shaking the urn before every trial; if of the thousand drawings 822 were white and 178 black, he would be irresistibly led to conclude that there must be more white balls than black ones in the urn. Not that this is absolutely necessary; for it is barely possible that there may be only one white ball and 999 black ones, and that by a very unlikely coincidence that one white ball may have come up 842 times out of the 1000 trials. More than this, a person used to observation would conclude, not only that there are more white balls in the urn, but that the proportion of white and black balls does not differ very greatly from that of 842 to 158. There is a disposition, derived from experience, to think that events happen in the long run in some sort of manner connected with the facilities afforded for their happening beforehand: and hence follows a disposition to judge what those facilities were from observed events, as well as to predict events from observation of those facilities; and it may happen that one person would draw his notion of likelihood from the first, and another from the second. Thus, if we were to put the question, 'What do you mean by saying that it is 5 to 3 for A against B?' one person might reply, 'I mean that in the long run A will happen 5 times for every 3 times which B happens;' while another might say, 'I mean that previous circumstances are so arranged, that for every 3 combinations under which B may happen, there are 5 under which A may happen.' If these two persons were to dispute which was the *true* mode of viewing the subject, they would be fighting about nothing; for both are true, and each of them follows from the other: but if they were to differ as to which is the *common* mode, we should feel rather disposed to side with the one who was for the first answer.

The following problems, illustrative of the connexion between the two modes, are the results of mathematical investigation. The table used is that given in MEAN, which we have re-examined and find correctly printed; but two decimal places must be made in column A, and four in column B: thus 845 opposite to 4 must be read as ·8451 opposite to ·04, similarly ·8761 comes opposite to 1·17, and ·9823 opposite to 1·69.

PROBLEM 1.—The probabilities of P and Q, at any one trial, are as a to b, that is, it is a to b for P against Q, and b to a for Q against P. A large number of trials $m(a+b)$ is made: what are the chances that the number of P's which happen shall lie between $ma+l$ and $ma-l$, and (of course) the number of Q's between $mb-l$ and $mb+l$ (l being small compared with ma or mb)?

RULE.—Calculate $(2l+1)\div\sqrt{\left(\frac{8mab}{a+b}\right)}$; let this be the A of the table (altered as above): then the corresponding B, altered as above, is the probability required.

EXAMPLE.—It is 2 to 1 that a throw with a die shall give 3, 4, 5, or 6, and not 1 or 2: what is the chance that, in 12,000 throws, the number which give 3, 4, 5, or 6 shall lie between 8000+100 and 8000−100. Here $a=2$, $b=1$, $m=4000$, $l=100$, and the complete calculation by logarithms* (which we insert merely as a guide to the readiest mode of making many complicated cases) is as follows:—

$m=4000$	3·6021	$2l+1=201$	2·3032
$a=2$	·3010		2·1646
$b=1$	·0000		
8	·9031	1·375	·1386
	4·8062		
$a+b=3$	·4771		
	2)4·3291		
	2·1646		

In the table, A being 1·38, B is ·9490, which is more than near enough for the purpose, say ·95: the result then is that ·95 is the chance in favour of the throws which give 3, 4, 5, or 6 out of 12,000 throws lying between 8000+100 and 8000−100, whereas ·05 is the chance against it; that is, it is about 95 to 5, or 19 to 1, that the throws shall so lie. A few instances of this kind will show how completely, in the long run, events may be expected to happen in numbers nearly proportional to what are called, when the precedent circumstances are fully known, their probabilities of happening.

PROBLEM 2.—In the preceding problem, to find l so that there may be a given probability that the P's shall lie between $ma+l$ and $ma-l$.

RULE.—Reduce the fraction which represents the given probability to a decimal fraction, and take the A corresponding to the B which is nearest to this fraction in the table; multiply by the square root above described, subtract 1, and divide by 2; the whole number nearest to the result is the answer required for l.

EXAMPLE.—In the preceding example, find l so that it is an even chance that the number of throws out of 12,000 which give 3, 4, 5, or 6 shall lie between $8000-l$ and $8000+l$. Here ½ or ·5 is the given probability, the nearest to it in column B is ·5027 to which A is ·48, which multiplied by the square root (or the number whose logarithm is 2·1646) is 69; subtract 1 and divide by 2, which gives 33 very nearly: hence it is an even chance (very nearly) that the number of throws out of 12,000, which give 3, 4, 5, or 6 lie between 8000−33 and 8000+33.

PROBLEM 3.—In $a+b$ trials, nothing whatever being known except what these trials tell, it is found that P happens a times, and Q happens b times; from which it is exceedingly likely that the probabilities of P and Q happening at a single trial would have been nearly as a to b, if we had known enough to form an *a priori* opinion. This we cannot do by hypothesis: but, judging from the preceding events, with what degree of probability may we infer that if we had been able to form an *a priori* opinion, the odds for P against Q would have appeared to us to lie between $a-k$ to $b+k$ and $a+k$ to $b-k$?

RULE.—Calculate $k\div\sqrt{\left(\frac{2ab}{a+b}\right)}$; let this be A (in the table); then the corresponding B is the probability required.

EXAMPLE.—In 600 drawings from an urn, the ball being replaced after each drawing, there were 418 white balls and 182 black ones. What is the probability that the proportion of white and black balls in the urn lies between that of 418−10 to 182+10 and 418+10 to 182−10, or that of 1000 to 471 and 1000 to 402? Here $a=418$, $b=182$, $k=10$; the square root above mentioned has 1·2021 for its logarithm, and 10 divided by this square root gives ·63 nearly. And A being ·63, B is also ·63 very nearly, which is the probability required; or it is 63 to 37, or nearly 2 to 1, that for every 1000 white balls in the urn, there are between 402 and 471 black ones.

PROBLEM 4.—When P happens much oftener than Q, we feel a very high degree of probability (moral certainty) that the same thing would happen in the long run, or would continue how long soever we might go on trying, unless there should arrive some change of circumstances. But when P does not happen much oftener than Q, we do not feel the same degree of assurance; for though Q might really happen oftener than P in the long run, yet the casual fluctuations of events might make the contrary appear in any one set of trials. Suppose then that in $a+b$ trials, P has happened a times, and Q has happened b times, a and b being nearly equal; what presumption can thence be derived that the excess will be on the same side in the long run on which it is in the $a+b$ trials?

RULE.—Divide the difference of a and b by the square root of twice their sum: let the result be A, and find the corresponding B; to this add 1, and divide by 2: the result is the probability required.

EXAMPLE.—Buffon, in a particular experiment, had to throw a coin (say a halfpenny) 4140 times; the result was 2048 heads and 2092 tails: what is the probability that some excess of tail over head would have continued for ever; that is, that the coin he used had in its construction some mechanical tendency to fall tail rather than head? Here $a=2048$, $b=2092$; the square root is ·48, which being A, B is ·50, and 1·50 divided by 2 is ·75, the probability required. This is ¾, so that it is 3 to 1 that some excess or other of tails would be found in the long run. Observe however that this does not mean an excess to the amount of 44 in every 4140 trials; but only some excess, small or great.

The experiment of Buffon, and its particular object, will be found in the 'Essay on Probabilities and Life Contingencies,' in the 'Cabinet Cyclopædia;' in which work will also be found a larger collection of such problems as the preceding, with fuller explanation and more extensive tables. These problems have been here introduced that the reader may have an opportunity of comparing and verifying the general sameness of results which follows from the two (perhaps) apparently differing notions from which the idea of the measure of probability may be derived.

Previously to laying down a few general rules, we shall notice the error to which persons who have not thought on the subject are most liable: this is a confusion between the

* In [illegible] cases, [illegible] the four-figure logarithms [illegible]

sort of confidence which is to be given to a result of the theory of probabilities, and that which is claimed by actual demonstration. Many persons are not aware that out of mathematics the greater number of conclusions are *probable* results, many of them, it is true, so highly probable that their chance of falsehood does not amount to that of drawing a black ball from among a million of white ones; but still not absolutely demonstrated. These highly probable results (so probable that the word probable in its common sense is weak as applied to them) form the ordinary knowledge of common life, and being practical certainties, are considered and mentioned as certainties, the imperceptibly small chance that they may not be true being disregarded. Hence it happens that when a result of this theory is announced, with its proper chance annexed, and though the probability of its truth is so high that it may rank with the moral certainties of ordinary life, there is a morbid disposition to dwell rather upon the one way in which the proposition may fail, than upon the million of equally possible ways in which it may be true. Thus if it be said that it is ten millions to one that P will happen, and not Q, therefore it is morally certain that P will happen—it is objected, But how do we know that the very next event will not be precisely the one of ten millions which is Q and not P? The answer is, we do not *know* it in the absolute sense of the word; if we thus knew it, it would be a certainty that P would happen, and whether P would happen or not, would not be a question for the theory of probabilities at all: but we do know it in the common sense of the word, since there are hundreds of conclusions which all men call knowledge, which are not so probable that they can be reasonably shown to have ten millions to one in their favour.

Another way in which the confusion we have mentioned shows itself is in the habit of reasoning against the probable truths just alluded to by arguments which could only be valid against an assertion that these truths were absolutely demonstrated. In compliance with the forms of language, those who advance such truths treat them as (moral) certainties: the opponent overthrows their (mathematical) certainty, and the fallacy lies in his supposing that he has thereby shown them not to possess that sort of truth which was claimed for them. For example, a medical man gives his opinion that a crime committed without any apparent motive is an indication of insanity: a newspaper ridicules this opinion, and asks, Are there no motives then which cannot be discovered? Now, if by apparent was meant apparent on the surface, or with slight examination, and if by indication was meant an absolute indication, certainly inexplicable except by the supposition of insanity, the answer is complete, and the opinion shown to be untenable. But suppose the energies of many acute persons and the resources of a whole nation to fail in making the motive of a crime apparent, and that this is what is meant by there being no apparent motive; suppose moreover that by an indication of insanity is meant a circumstance which renders insanity highly probable: the answer then is wholly irrelevant. The opinion, expanded into an argument, is—a crime committed absolutely without motive or object shows insanity; a motive, if it exist, may almost certainly be discovered by proper exertions; consequently the appearance of no motive, after all exertions to discover one have been tried, makes it most likely that the crime was an act of insanity: it is in fact as likely that the crime was an act of insanity, as it was unlikely that the exertions to discover a motive should have failed, if there had been a motive.

The application of this theory to the art of reasoning, in the numerical sense, is rendered practically impossible by our want of a proper numerical determination of the probability of premises. But the rules which we should follow, if such a numerical determination could be obtained, will show that a result of common sense is perfectly conformable to the theory, namely, that a considerable number of arguments, each of no overpowering force in itself, may, when put together and looked at conjointly, give a very high degree of probability to their common conclusion. Let there be already a conclusion, in favour of which the odds are a to b, and let an argument be introduced which, independently of all previous association, would give to the same conclusion the odds of A to B: then the effect of that argument upon the previous state of mind with respect to the conclusion ought to bring the odds for that conclusion to those of $(A+B)(a+b)-Bb$ to Bb. Thus, let us suppose a person feels it to be 3 to 2 that a conclusion is true: he finds an argument from which alone he would conclude it to be 5 to 4 for the same: he ought then to regard the conclusion on the whole as having $9\times5-2\times4$ to 2×4, or 37 to 8 in its favour. Let another argument be found for the same conclusion, such as would alone give it 4 to 1 in its favour; then the final odds should become $45\times5-8\times1$ to 8×1, or 217 to 8 in its favour, and so on.

The preceding rule leads to this result, that any argument in favour of a conclusion, however weak it may be, adds something to the force of the preceding arguments: thus, if a conclusion have an even chance, or 1 to 1 for it, and if an argument be found for it which has only 1 to a thousand for its chance of being sound, the resulting odds for it are $2\times1001-1\times1000$ to 1×1000, or 1002 to 1000; more than before. This result seems strange at first to many, whether it be announced in connection with this theory or not: but the strangeness arises from confounding a weak argument in favour of a conclusion with a strong argument against it. That weak arguments injure their cause arises from the supposition which they favour, that those who urge them have no strong ones, and from the opportunity which they give opponents to answer the weak ones, and pass over the strong ones. But if both sides were candid and well informed, the weaker arguments on each side would be allowed their due weight.

An argument may fail, and its conclusion not be necessarily false: let us now take the case of arguments on both sides, those which tend to establish the conclusion, and those which tend to establish something contradictory. Let P be the conclusion and Q a proposition, such that P and Q cannot be true together. Two cases arise, according to whether P and Q can both be false, or whether one of them must be true and the other false. Let the arguments for P, supposed to be joined by the preceding rule, give A to a for it; and let the arguments for Q, joined in the same way, give B to b for it. Then—

1. If, of P and Q, one must be true and the other false, it is $A\times b$ to $a\times B$ for P being true. Thus, if the direct arguments for P give 5 to 3 in its favour, and the direct arguments for Q, 2 to 1, it is 5×1 to 3×2, or 5 to 6 for P on the whole question.

2. If P and Q may both be false, it is $A\times b$ to $a(B+b)$ that P is true. Thus, in the last example, if both may be false, it is 5×1 to $3\times(2+1)$, or 5 to 9 for P being true.

The various problems of which the solutions have been given are mathematical consequences of the definition of probability. Every such problem is simply one of combinations, however much the length of detail, and the number of mathematical abbreviations of the process of combining, may tend to make us lose sight of the first principle. At the same time it is found requisite to establish a few simple fundamental propositions, which we shall cite, with some consequences. As we are not writing an elementary treatise, we shall not demonstrate these propositions, referring the student to any of the modern works hereinafter cited. The probabilities of the events A, B, C, &c., are denoted by a, b, c, &c.

1. By the probability of A is meant the fraction which the number of cases favourable to the happening of A is of the whole number of cases, that is, both of those in which A can happen, and those in which it cannot. And the probability that A will not happen is $1-a$.

2. When A and B are events independent of each other, so that the happening of either in no way promotes or retards the happening of the other, the probability that both shall happen is ab; that neither shall happen, $1-a-b+ab$; that one only shall happen, $a+b-2ab$; that one or both shall happen, $a+b-ab$.

3. When A and B are mutually exclusive, that is, when if one happen the other cannot, the probability that one or other shall happen is $a+b$; and that neither shall happen, $1-a-b$.

4. If either A or B must happen, $a+b=1$; and if n trials are to be made, the several terms in the expansion of $(a+b)^n$ are the chances of the arrivals denoted by their exponents. Thus—

a^n is the chance that all are As.

$na^{n-1}b$, that $n-1$ are As and one is B.

$n\dfrac{n-1}{2}a^{n-2}b$, that $n-2$ are As and two are Bs, &c.

5. When an event has happened which may have sprung from any one of the sets of circumstances which we may denote by A, B, C, D, &c., and it is desired to find what is the probability of the event which did happen having arisen from one or another set, proceed as follows:— Had the circumstances denoted by A certainly existed, and the event been a contingency, let a be the probability that those circumstances would have produced the event; or briefly, let a be the probability that A, when certain, brings about the event. Let b be the same for B certain, c for C, &c. Then the probability that it was A which brought about the event which did happen, is the first of the following set:—

$$\frac{a}{a+b+c+\&c.},\quad \frac{b}{a+b+c+\&c.},\quad \frac{c}{a+b+c+\&c.}$$

the probability that it was B is the second, that it was C, the third, and so on. Or, when convenient, instead of a, b, c, &c. may be substituted any whole numbers which are proportional to them. For example, let there be three lotteries containing balls as follows:—

All white.	4 white, 1 black.	2 white, 7 black.

A drawing has been made three times from one of these, but from which is not known, the ball being replaced after the drawing, and every drawing has given a white ball. Required the chances in favour of each of these lotteries having been the one drawn from. If it had been the first, the chance of the event would have been 1 (or certainty); if it had been the second, the chance of the event would have been $\frac{4}{5}\times\frac{4}{5}\times\frac{4}{5}$, or $\frac{64}{125}$; if it had been the third, the chance would have been $\frac{2}{9}\times\frac{2}{9}\times\frac{2}{9}$, or $\frac{8}{729}$. The numerators of these fractions, reduced to a common denominator, are 91125, 46656, and 1000; whence the probability that the lottery drawn from was the first, is

$$\frac{91125}{91125+46656+1000}, \text{ or } \frac{91125}{138781};$$

and the probabilities of the second and third lotteries are

$$\frac{46656}{138781} \text{ and } \frac{1000}{138781}.$$

The preceding question is well calculated to show the meaning of questions in this theory, which is thus seen to be applied to events, not because they are uncertain, but because they are unknown. As soon as the lottery is chosen, it is certain which it is, but since it is not known to the drawer, it is to him as much a contingency as it was before it was chosen.

6. When, in such a case as the preceding, it is required to know the probabilities of the events which may happen at any further trials, the probability of each lottery having been the one in question is to be multiplied by the probability of the new event arising from that lottery, and the results added together. Thus, suppose there are two lotteries, one having all white balls, and the other equal numbers of white and black balls; two drawings have been made from one of them (not known) and both drawings have given a white ball; what is the probability that a third drawing from the same lottery would give also a white ball? The chances for the two lotteries are found by the last to be $\frac{4}{5}$ and $\frac{1}{5}$, while the chances of a white ball from one and the other are 1 and $\frac{1}{2}$. It follows that $\frac{4}{5}\times 1+\frac{1}{5}\times\frac{1}{2}$, or $\frac{9}{10}$, is the chance of the third drawing giving a white ball.

7. If A or B must happen at every trial, and if in m trials nothing but A has happened, and if we know nothing whatever about the nature of preceding circumstances, then it is $m+1$ to 1 that A shall happen at the next trial, and $m+1$ to h that A shall happen throughout the next h trials. But if in $m+n$ trials A have occurred m times and B n times, it is $m+1$ to $n+1$ that A shall occur at the next trial.

8. Every event that can happen must happen if trials enough be made; and not only must happen, but must happen any number of times in succession. For example, if there be only one white ball to 100 black ones in an urn, and if drawings enough be made, the ball drawn being always returned and the urn properly shaken before a new trial, a person who goes on must at last draw that single white ball 1000 times running. This is a conclusion which the beginner cannot receive, particularly when he is told that 1,000,000 might be written for 1000, or any other number however high. Nevertheless, it will, in the course of his studies, not only be made clear to him, but it will also be shown that it is a conclusion which may be made obvious to common sense without any very profound mathematics.

9. If the odds against an event happening at any one trial be n to 1, there is an even chance of its happening in $\cdot 69\times n$ trials,* it is 10 to 1 that it happens in $2\cdot 30\times n$ trials, 100 to 1 that it happens in $4\cdot 61\times n$ trials, 1000 to 1 that it happens in $6\cdot 91\times n$ trials, and 10,000 to 1 that it happens in $9\cdot 21\times n$ trials. Thus if it be 200 to 1 against success in any one trial, $9\cdot 21\times 200$ being 1842, it is 10,000 to 1 that there shall be one success at least in about 1842 trials. But if a person should make 1000 trials without one success, he would have no right to say that it is 10,000 to 1 in favour of one or more successes in the next 842 trials.

10. When any sum depends upon a *contingent event*, the present value of that sum is such a fraction of it as the probability of the event happening is of unity. Thus 20*l.* to be gained if an event happen against which it is 7 to 1, is now worth only the eighth part of 20*l.*

There are no questions in the whole range of applied mathematics which require such close attention, and in which it is so difficult to escape error, as those which occur in the theory of probabilities. This makes it difficult to lay down in a short space either maxims or examples sufficient to be really of use in advancing the student's progress; and of all subjects, there is no one in which writers of every grade have so frequently or so strangely made mistakes of mere inadvertence. One was pointed out a short time ago (*Camb. Phil. Trans.*) into which both Laplace and Poisson had fallen, one after the other; but the discoverer of their slip proved himself signally liable to greater ones a very little while after. (*Cab. Cyclop.*, 'Probability and Life Insurance,' p. 28.)

We shall conclude by a brief account of the historical progress of this branch of science; referring the reader for more detail to Montucla, and to the Treatise 'On Probability,' in the 'Library of Useful Knowledge.' Those who cultivated games of chance must at all times have had a general notion of combinations which were more probable than others, and must have seen that those cases of which there were most to happen, always did in reality happen most often. They could not fail to know, by reckoning on their fingers, that out of, for instance, all the throws of a pair of dice, there are only six doublets, and thirty other equally possible cases; nor could they have missed knowing that this must be the reason why doublets occur seldom in comparison with other throws. Notwithstanding this, the mathematical history of the subject usually dates from a fragment by Galileo, which merely shows why 10 can be oftener thrown on three dice than 9, and two problems proposed by Chevalier de Meré to Pascal, in 1654, concerning certain points connected with games of chance.

That the history of *correct* investigation dates from this period there can be little doubt, but the subject had been previously considered by Cardan, in a work,' De Ludo Aleæ,' published from his manuscript in the first volume of the collected edition of his works, and never separately; and also so badly printed as to be almost unintelligible; circumstances both of which have probably contributed to keep it, as it has been kept, totally out of view. Cardan's theory is perfectly false: he supposes, for example, that since there are six faces to a die, it will happen in the long run that each face will come up once in six throws, which is true when many collections of six throws are averaged; but from this he draws the false conclusion that it is an even chance that any one face comes up in three throws. His numerical reasoning is therefore totally incorrect; but his notions on the general subject of probability are reasonably sound. Fortune, according to him, does not decide the general average of the play, but only the deviations on one side and the other which a small number of cases present; and experiment would, he says, prove that the long run would agree with the predictions of theory. This treatise was written about 1524, and published in 1663. But before this, in 1658, the tract

* The number ·69, 2·30, &c., are all approximations.

of Huyghens, 'De Ratiociniis in Ludo Aleæ,' was published as an appendix to Schooten's 'Exercitationes Geometricæ,' being not only the first regular treatise, but the first which applies the theory to chances of loss or gain. It was translated into English, with additions, in 1692, the reputed author being Motte, the secretary of the Royal Society. Then followed the 'Analyse des Jeux de Hasard,' by Montmort (first edition 1708, second, enlarged, 1713), a work of higher mathematical pretensions. The 'Ars Conjectandi' of James Bernoulli, posthumously published by his nephew Nicolas, in 1713 (and which, it may be worth noting, is not contained in the collection of James Bernoulli's works), gives the first glimpse of the more difficult class of problems in which processes containing very large numbers are abbreviated by mathematical analysis. This was carried still further by De Moivre, whose first work, a paper 'De Mensura Sortis' (*Phil. Trans.*, 1711), was expanded into his celebrated treatise on the doctrine of chances, first edition 1718 (not 1716, as frequently stated), second edition 1738, third edition, with his 'Treatise on Life Annuities,' 1756. The next step was made by Bayes (*Phil. Trans.*, 1763 and 1764), who first considered the probability of hypotheses as deduced from observed events.

The great work of Laplace (first edition 1812, third 1820) had in great part appeared at various previous times in the Memoirs of the Academy of Sciences. It is remarkable, first by the extension of methods which it furnishes, secondly by its giving at one view the whole state of the science and its applications, thirdly by the particular attention given to the application of the theory to the results of observation. [MEAN; LEAST SQUARES.] The next step in the history is Poisson's 'Recherches sur les Probabilités des Jugemens,' 1837, which gives the grand results of Laplace by a somewhat different analysis, and applies them particularly to the subject indicated in the title. This species of application had been before considered by Condorcet, in his 'Essai sur l'Application de l'Analyse à la Probabilité des Decisions,' Paris, 1785. It may also be worth while to mention the 'Traité de Calcul Conjectural' of Parisot, Paris, 1810, a work which deals largely in the theory of simple combinations. The elementary work of longest standing, which exhibits some view of the higher mathematical applications, is the 'Traité Elementaire du Calcul des Probabilités,' by M. Lacroix (second edition, 1822). The 'Essai Philosophique' of Laplace, which is an introduction to the third edition of his theory, contains no mathematics, and may be usefully read with any elementary treatise. The 'Instructions Populaires sur le Calcul des Probabilités,' by M. Quetelet, Brussels, 1828, contains the most elementary view of the subject, and uses only simple arithmetic.

In England, since the publication of Simpson's 'Laws of Chance,' 1740, and the 'Laws of Chance,' by Samuel Clark, 1758, little was written on the mathematical theory except so far as it had reference to life annuities and assurance, until a very recent period. About 1830, Messrs. Lubbock and Drinkwater published a tract 'On Probability,' in the 'Library of Useful Knowledge,' giving more general methods of applying modern algebraical investigation than had before appeared in this country. In 1837, the article 'Theory of Probabilities' in the 'Encyclopædia Metropolitana,' written by Mr. De Morgan, gave the results and methods of Laplace on most of the great questions of the theory. The 'Essay on Probabilities, and on their Application to Life Contingencies and Insurance Offices,' published by the same writer in the 'Cabinet Cyclopædia,' 1838, exhibits the principles without mathematical investigation and the results arranged in rules for use. The article on 'Probability' in the new edition of the 'Encyclopædia Metropolitana,' by Mr. Galloway, gives the mathematical investigation of the higher parts of the theory, following the methods of Poisson. This treatise is published separately.

On subjects connected with this article, see GAMING, RISK, WAGER, MEAN, LEAST SQUARES, OBSERVATION AND EXPERIMENT, WEIGHT OF OBSERVATIONS, ANNUITY, MORTALITY, REVERSION, &c.

PROBATE. [WILL.]

PROBLEM (πρόβλημα) means simply a thing put forward or proposed. In mathematical language it is anything which is required to be done, and in the earlier writers is distinguished from a theorem, or assertion to be proved, in that the latter does not require any specific object to be effected. Thus, 'all the angles of a triangle are together equal to two right angles' is to be shown or made evident, and is a theorem; but 'to draw a circle through three given points' presents an object to be effected, and is a problem. But it must be remembered that this difference lies more in the nature of the result than in the method; for the solution of this problem, so called, is an intuitive corollary from the theorem that if three points be joined, and perpendiculars be drawn bisecting two of the joining lines, the intersection of these perpendiculars is equidistant from the three points. It is also to be noted that this distinction of theorem and problem appears neither in the Greek of Euclid, Apollonius, nor Archimedes, the general term employed by all three, and in all cases, being πρότασις, which is translated by proposition. The distinction then is of a later date, and is the work of annotators: it appears in Pappus, according to the Latin of Commandine. It does not appear in the translation of Euclid by Athelard* (which goes by the name of Campanus); and the first edition of the Elements in which we find it is the subsequent edition of Zambertus. If we leave the modern followers of the old geometers, we find the word problem used in its simple etymological sense of something proposed; but for the most part employed when the something proposed contains, or has contained, a remarkable difficulty. Thus to this day we talk of the problem of three bodies, as being one the methods of which are hoped to be found capable of decided improvement. In algebra the word is variously used, though, according to the antient distinction, the solution of any equation of condition should be called a problem, and the establishment of any identity a theorem.

Perhaps the most correct use of the term is that of our own universities, in which questions proposed for examination are called problems when they are left entirely to the student to solve, not being to be found in the elementary treatises which he is supposed to have read. The adjective problematical is used in the sense of doubtful, but is not a mathematical term.

PROBOSCI'DIANS. [PACHYDERMATA, vol. xvii., p. 116.]

PROBUS, MARCUS AURE'LIUS, a native of Sirmium, served early in the Roman army, and distinguished himself so much that he was made tribune, whilst yet beardless, by the emperor Valerianus, who had great esteem for him, and who recommended him in his letters to his son Gallienus as a young man of great promise. Probus continued to serve with distinction under Gallienus, Claudius II., Aurelianus, and Tacitus. Several letters of these emperors, containing encomiums of Probus, are quoted by Vopiscus. Tacitus, immediately after his exaltation, wrote to Probus, saying that he considered him as the main prop of the state, and at the same time he gave him the command of all the legions in the East, with a large increase of emolument. Probus was beloved by the soldiers for the care which he took of them, and the equal justice which he administered. He served in almost every part of the Roman world—beyond the Danube against the Quadi and the Sarmatians, in Libya, in Egypt, where he erected buildings, excavated canals, and made other improvements; he fought against the Palmyrenians under Aurelian, and afterwards served in Gaul. When Tacitus died, six months after his assumption of the empire, his brother Florianus was proclaimed emperor in the West, whilst Probus was proclaimed in the East; but in less than three months Florianus was put to death by the soldiers, and Probus was acknowledged universal emperor. He was then forty years of age. He defeated several pretenders to the empire, Saturninus in the East, and Proculus and Bonosus in Gaul. He encouraged the cultivation of the vine in Gaul and in Pannonia, as well as in Mœsia near Sirmium. He is said to have incurred the displeasure of the soldiers by having said that he hoped shortly that universal peace being established over the empire, their services would no longer be required. An insurrection having broken out in his camp near Sirmium, he took refuge in an iron tower which he had constructed as a watch-tower, but being followed by the mutineers, he was killed, A.D. 282. He is compared by Eutropius with Aurelian for his military abilities, though he was superior to him in refinement and humanity. Vopiscus (*Historia Augusta*) has left a high eulogium of Probus. He reigned six years and four months, and was succeeded by Carus.

* At the time when we published [GEOMETRY] our own unsupported opinion that Athelard, and not Campanus, was the translator, we did not know that Tiraboschi had already affirmed the same thing. Mr. Halliwell ('Rara Math.,' p. 57) makes it most probable that the commentary as well as the translation is Athelard's.

Coin of Probus.
British Museum. Actual Size.

PROCACCINI, ERCOLE, the Elder, was the head of the celebrated family of artists of that name. He was born in 1520, at Bologna, where the greater number of his works still exist. Authors are divided in opinion respecting his merits; Baldinucci and Malvasia call him a painter of moderate talent, while Lomazzo esteems him to be a happy imitator of the colouring and grace of Correggio. His design may be too minute, and his colouring too languid, but he possessed far more taste than most of his contemporaries, and was free from mannerism, which eminently qualified him for an instructor of youth. Several eminent artists, among whom were Sammachini, Bertoja, and his own three sons, were his disciples. The time of his death is uncertain, but he was living in 1591.

PROCACCINI, CAMILLO, born in 1546, received his first instruction in the school of his father. He afterwards visited Rome, where some biographers say that he studied the works of Michael Angelo and Raphael. His works evidently show that he had been charmed by Parmegiano. He combined a simplicity and spirit by which he would always charm the eye, though it must be owned that they are too often deficient in the higher power of impressing the mind and moving the affections, which indeed we can hardly expect when we consider the prodigious number of his works in Bologna, Ferrara, Ravenna, Reggio, Piacenza, Pavia, and Genoa. Sometimes he allowed himself more time, and then his works have less of the mannerist. His St. Roque at Reggio deterred Annibale Carracci from painting in competition to it. At Piacenza he had less success in painting against Ludovico; yet his picture occupies the principal place. He died in 1626.

PROCACCINI, GIULIO CESARE, the best artist of the family, was born in 1548. He renounced sculpture, in which he had made considerable progress, for painting, which he studied in the school of the Caracci. The works of Correggio were the principal object of his studies, and many judges are of opinion that no painter ever approached nearer to the style of that great artist. In some of his easel pictures and works of confined composition, he has been mistaken for Correggio. A Madonna of his, at S. Luigi de Francesi, has been engraved as the work of that master; and there are paintings still more closely approximating to this style in the palace of Sanvitali at Rome and in that of Carrega at Genoa. Of his altar-pieces, that at Santa Afra in Brescia is perhaps most like the style of Correggio; it represents the Virgin and Child amidst a smiling group of saints and angels, in which dignity seems as much sacrificed to grace as in the second cortile of the Virgin and the Angel in the Nunziata of S. Antonio of Milan. He is sometimes blameable for extravagance of attitude as in the Executioner of S. Nazario, which is otherwise a picture full of beauties. Notwithstanding the number and extent of his works, his design is correct, his forms and draperies select, his invention varied, and the whole together has a certain grandeur and breadth, which he either acquired from the Caracci, or, like them, derived from Correggio. He died in 1626, aged seventy-eight.

PROCACCINI, CARLO ANTONIO, brother of Camillo and Giulio, was born at Bologna, and learned the art from his father. Not having, like his brothers, sufficient genius or invention to attain eminence in historical composition, he devoted himself to landscape, in which he acquired considerable reputation, as well as by fruit and flowers, which he designed after nature.

PROCACCINI, ERCOLE, called the Younger, was born in 1596, at Milan. He was the son of Carlo Antonio, and studied under his uncle Giulio Cesare. He frequently painted history and landscapes, but his chief excellence appeared in his flower-pieces, which he painted with great taste and perfection. He died in 1676, at the age of eighty.

PROCELLARIA. [PETRELS, vol. xviii., p. 25.]

PROCESS. This term is sometimes used in its original sense as comprehending the whole of the proceedings which take place, and are recorded by the court, in the course of a case, criminal or civil, previous to final judgment. In this sense the word (processus, process) is also used in the French and the Roman law. In its more ordinary and limited signification the term is applied to the writs which issue out of any court for the purpose of compelling the parties to a suit, and other persons whose co-operation is required, to do some act connected with the progress of the suit. In this sense also process is either civil or criminal.

Civil process was formerly, and until lately, practically divided into original, mesne (intermediate), and final process.

Original process, more commonly known as original writs, issued out of the common-law side or department of the court of chancery, hence called the officina justitiae, the shop at which the right of suing in the king's superior courts might be purchased. The price of this privilege was formerly arbitrary, and until the reign of John the render to the crown was more commonly stipulated for in hawks and horses than in money. But since Magna Charta original writs have been purchasable at a small ad valorem fine of 10s. per cent. upon the amount sought to be recovered.

Mesne process was that which issued between the original writ and final judgment, including writs issued for the purpose of compelling the attendance of jurors and of witnesses, and for other collateral purposes. In order to avoid the expense and delay of suing out an original writ, it had long become usual to commence actions by mesne process founded upon a supposed original writ which never had in fact issued. By degrees all process before final judgment, except an original writ out of Chancery, acquired the name of mesne process, even in cases where it formed the legal as well as the actual commencement of the suit, as in scire facias, audita querela, &c.

Final process comprehends writs of execution. [EXECUTION.]

Mesne and final process are sometimes called judicial process, because they issue under the authority of the judges of the court in which the action is pending. A great variety existed in the different forms of process by which actions were commenced in the three superior common-law courts, the inconveniences resulting from which are pointed out in the 'First Report of the Common-Law Commissioners,' presented in 1829, pp. 72 to 101, 121, &c., 129, &c. But now, by 2 Wm. IV., c. 39, it is enacted, that in actions brought in the courts of law at Westminster, the process shall be a writ of summons, in a form prescribed by the statute, which is addressed to the defendant and requires him to cause an appearance to be entered within eight days from the service of the writ. If the writ be served on the defendant, and he does not enter an appearance, the plaintiff may direct his own attorney to appear for the defendant, and the defendant being actually or constructively in court by an appearance entered by himself or by the plaintiff for him, the action proceeds. If the defendant cannot be served with the writ of summons, a writ of distringas may be sued out, by which the sheriff is directed to distrain the defendant by his goods for the purpose of compelling an appearance, and if he still hold out, the plaintiff may cause an appearance to be entered for him.

Where the proceedings are against a trader who is a member of parliament, the writ of summons informs the defendant that an affidavit of debt for the sum of .... l. has been filed in the proper office, according to the provisions of the Bankrupt Act, 6 Geo. IV., c. 16, § 10, and that unless the defendant pay, secure, or compound for the debt, or enter into the bond, as provided by that act, and cause an appearance to be entered within one calendar month after service of the writ, he will be deemed to have committed an act of bankruptcy from the time of the service.

The act contains a provision for commencing actions where it was intended to have the security of the personal detention of the debtor, by writ of capias, if the defendant were at large, and by writ of detainer, if he were already in custody. But by 1 & 2 Victoria, c. 110, arrest upon mesne process (as it is called in the statute) is taken away, except in cases where an arrest is ordered by the court or a judge, and all actions must be commenced by summons, though if the court or a judge order an arrest, a capias may issue in the course of the cause already commenced by writ of summons.

By the operation of these statutes the writ of summons is the only process for commencing personal actions in the courts at Westminster. And by 3 & 4 Will. IV., c. 27, s. 36, all actions *real* or *mixed*, except writs of dower [DOWER], quare impedit [QUARE IMPEDIT], and ejectment [EJECTMENT], are abolished. These excepted actions may still be brought by original writ; which term is commonly confined to an original writ issuing out of chancery; the writ of summons, though really an original writ, not being in modern practice so designated.

By 2 & 3 Vict., c. 27, s. 3, all personal actions in borough courts are directed to be commenced by writ of summons.

Criminal Process.—Where an indictment [INDICTMENT] for treason or felony is found by a grand jury, process of capias issues to the sheriff, commanding him to arrest the indictee. But where an indictment found, or an information filed, charges the party with a misdemeanor only, the process is at common law a venire facias, being a command to the sheriff to cause the indictee, &c. to come into court, which, under this process, must be done by summoning him. If the indictee, &c. does not obey the summons, and it appears by the return that the indictee, &c. has lands in the county, a writ of distringas issues, commanding the sheriff to compel the indictee to appear, by distraining him by the issues (the produce) of those lands, to appear. If the return to the venire facias shows that the indictee has no lands, process of capias issues. And by 48 Geo. III., c. 58, s. 1, whenever any person is charged with any offence for which he may be prosecuted by indictment or information in the King's Bench, not being treason or felony, and the same shall be made to appear to any judge of the same court by affidavit, or by certificate of an indictment, or of information being filed, against such person in the said court for such offence, such judge may issue his warrant under his hand and seal, and thereby cause such person to be apprehended and brought before him or some other judge of the same court, or before some one justice of the peace, in order to his being bound, with two sufficient sureties, in such sum as the warrant shall express, with condition to appear in the said court at the time mentioned in the warrant, and to answer all indictments or informations for any such offence.

Before any indictment is found, a party charged upon oath with treason or felony may be brought before a magistrate by virtue of a warrant issued for his apprehension by the same or some other magistrate of the district, and may by another warrant be committed to prison for trial, if upon the examination there appear to be grounds to suspect that the party is guilty.

PROCESS-VERBAL (*Procès-verbal*) is a term derived from French jurisprudence, in which it signifies a memorandum or instrument drawn up and attested by officers of justice, containing a statement of the circumstances which have taken place upon the execution of a commission, upon an arrest, upon a precognition or preliminary examination of a party accused, or in the course of other legal investigations, and set forth in the order in which they have occurred. The term is now frequently applied to a contemporaneous detailed minute or note of any formal proceeding, though not occurring in the course of any legal inquiry, *e.g.* a note of the discussions which are taking place during the negotiation of a treaty, &c.

PROCHI'LUS. [BEAR, vol. iv., p. 90.]

PRO'CHYTA. [PROCIDA.]

PRO'CIDA, the antient Prochyta (Προχύτη, Strab.), is an island at the north-west entrance of the Bay of Naples, situated between the larger island of Ischia and Cape Misenum. Procida is about eight miles in circumference; it is generally level, with some gently rising grounds, and is fertile and well cultivated. The vineyards produce good common wine. The population exceeds 10,000; the men are mostly sailors and fishermen, and are reckoned among the most enterprising in the kingdom: many of them are engaged in the tunny and coral fisheries. The dress of the women bears some resemblance to that of the women of the Greek islands. The island contains several villages or hamlets, a small fort, and a royal palace or country-seat.

It was an old tradition (Strabo, pp. 60, 258), that Prochyta and Pithecusa were separated from Misenum by a violent convulsion of nature. (Compare Pliny, *Nat. Hist.*, ii. 88; iii. 6.)

PRO'CI'DA, GIOVANNI DI. [ANJOU, DUKES AND COUNTS OF.]

PROCLAMATION. By the constitution of England, the king possesses the exclusive prerogative of issuing proclamations; for although this authority is exercised by the lord mayor in the city of London, and by the heads of some other corporations in other cities, for certain limited purposes, it is always founded upon custom or charter, and consequently only exists in such cases by delegation from the crown.

The nature and objects of royal proclamations are various. In some instances they are merely an authoritative promulgation of matters of state, or of acts of the executive government which it is necessary that all persons should know, and upon notice of which, as presumed to be conveyed by a public proclamation, certain duties and obligations attach to subjects. Proclamations of the accession of a new king or a demise of the crown, and proclamations for reprisals upon a declaration of war with a foreign state, and for rendering coin current within the realm, are examples of this kind. Another class of proclamations consists of those which declare the intention of the crown to exercise some prerogative or enforce the execution of some law which may have been for a time dormant or suspended, but which a change of circumstances renders it necessary to call into operation. Thus the king might, by a proclamation in time of war, lay an embargo upon shipping, and order the ports to be shut, by virtue of his antient and undoubted prerogative of prohibiting any of his subjects from leaving the realm. And there is no doubt that a breach of the duty imposed or declared by a proclamation of this kind would be punishable, either as a contempt, or as a misdemeanor at common law. Another and by far the most usual class of proclamations issued by the crown consists of formal declarations of existing laws and penalties, and of the intentions of government to enforce them, designed, as some of the early books term it, *quoad terrorem populi*, and merely as admonitory notices for the prevention of offences. A familiar instance of this kind of declaration is the proclamation against vice and immorality appointed to be read at the opening of all courts of quarter-sessions.

It is quite clear that at the present day the royal prerogative does not authorise the creation of an offence by proclamation which is not a crime by the law of the land; in the language of Sir Edward Coke (3 *Inst.*, 162), 'Proclamations have only a binding force when they are grounded upon and enforce the laws of the realm.' In early periods of our history after the Norman conquest, the power of the crown in this respect appears to have been much more extensive, and instances of proclamations may be found in Rymer's 'Fœdera,' and elsewhere, evincing an assumption of almost despotic authority by the crown. In the reign of Henry VIII. it was enacted, by the statute 31 Henry VIII., c 8, that the king, with the advice of his council, might set forth proclamations under such penalties and pains as to them might seem necessary, which should be observed as if they were made by act of parliament; but this statute contained an express declaration that proclamations should not alter the law, statutes, or customs of the realm (Coke's *Reports*, part 12, p. 75), and was repealed about five years afterwards by the stat. 1 Edw. VI., c. 12. A strenuous attempt was made in the reign of James I. to strengthen the crown by increasing the prerogative of making proclamations, which, though encouraged and promoted by the lord chancellor Ellesmere and Bacon, were resisted by Coke, and occasioned great alarm and dissatisfaction among the people. The encroachments which had been made and attempted in this respect are enumerated and complained of in the 'Petition of Grievances' by the Commons, in 1610 (Howell's *State Trials*, vol. ii., p. 524); and in the same year it was expressly resolved by the judges (of whom Sir Edward Coke was one) that the king could not by his proclamation create an offence, which was not an offence before; 'for if so, he might alter the law of the land by his proclamation.' (Coke's *Reports*, part 12, p. 76.)

PROCLUS, a celebrated Neo-Platonist, was born at Constantinople, on the 8th of February, A.D. 412. His parents, who were people of wealth and consideration, resolved to give him the best possible education, and with this view sent him to Xanthus in Lycia, where he was taught reading, writing, and grammar; thence to Alexandria, where he attended the lectures of all the most eminent teachers of philosophy and mathematics; and finally to Athens, where he became a disciple of Plutarchus and Syrianus, two distinguished philosophers of that school. Proclus was the last rector of the Neo-Platonic school at Athens, and died there, A.D. 485, *i.e.* as his successor and biographer Marinus defines it, 124 years after the reign of Julian. (Marinus, *Vita Procli*, c. 36.) As the successor of Syrianus, he is sometimes called Diadochus.

The works of Proclus, which are very numerous, consist principally of commentaries on older writers; of these the best known are his commentaries on the 'Timæus' and 'Parmenides' of Plato, the latter of which has been recently printed as an appendix to Stallbaum's bulky edition of the dialogues. He wrote also commentaries on Hesiod's 'Works and Days;' on Ptolemy's 'Astrology;' and on the first book of Euclid's Elements,* in two books. His original works, besides a few hymns of doubtful merit, are a treatise 'On the Sphere,' published by Bainbridge, London, 1520 (which however is mostly taken from Geminus), and 'Eighteen Arguments against the Christians,' in which he endeavours to prove that the world is eternal.

In his style Proclus is much more perspicuous and intelligible than his predecessor Plotinus; indeed he is on the whole a good writer, and occasionally is almost eloquent. But the matter of his works has not much to recommend it: his propensity to allegorise everything, even the plainest and simplest expressions in the authors on whom he comments, must deduct largely from his merits as an expounder of other men's thoughts; and but for the interest which attaches to him as the last of a school of philosophy, it is not much to be regretted that his works have slumbered so long in the dust of libraries, and have been either wholly neglected or imperfectly edited. 'His life,' says Gibbon, 'with that of his scholar Isidore, composed by two of their most learned disciples, exhibits a deplorable picture of the second childhood of human reason.'

The commentaries on Euclid's first book are valuable for the large number of scattered pieces of information which they give on the history of geometry; but as commentaries they are only useful as showing what kind of discussion took place on geometrical questions at the time when they were written. These commentaries were translated by the late Mr. Thomas Taylor, whose attempts to revive all kinds of Platonism are well known. The original Greek was published by Hervagius at Basle, but from so bad a manuscript, that the Latin of Barocius (Patavii, 1560), taken from more and better manuscripts, is a better authority when it differs from the Greek of the Basle edition.

The reader who has any curiosity to know more of this author may refer to the following books (1) 'Procli Opera,' ed. Victor Cousin, Paris, 1820-27, 6 vols. 8vo.; (2) 'Initia Philosophiæ ac Theologiæ ex Platonicis fontibus ducta, sive Procli Diadochi et Olympiodori in Platonis Alcibiadem Commentarii,' ed. Fr. Creuzer, Francof. ad Mœn., 1820-25, 4 vols. 8vo; (3) 'Ex Procli Scholiis in Cratylum Platonis, ed. J. F. Boissonade, Lips., 1820; (4) Translation of the Six Books of Proclus on the Theology of Plato, &c., by Th. Taylor, Lond., 1815, 2 vols. 4to.; (5) 'The Commentaries of Proclus on the Timæus of Plato,' in 5 books, by Th. Taylor, Lond., 1820, 2 vols. 4to.

PRO'CNIAS, Count Hoffmansegg's name for a genus of birds placed by Mr. Swainson and others under the subfamily *Bombycillinæ*, Swallow Chatterers.

Generic Character.—Bill very broad; the sides inflected; the tip not hooked. Nostrils nearly naked. Wings pointed; the three first quills longest. Inner toe shorter than the outer. Tail slightly forked. (Sw.)

Example, *Procnias ventralis*, *Swallow Fruit-eater*.

Description.—(*Male.*)—Blue; front, throat, and temples black; middle of the body beneath white, the sides with blackish transverse striæ. Length about 5½ inches. *Female.*—Green; chin and temples grey; body beneath yellowish, transversely striated with dusky-green.

Mr. Swainson (*Zoological Illustrations*, 1st series) remarks that the birds of this genus are remarkable for the enormous width of their mouths, which in some species exceeds that of the Swallow family, thus enabling them with ease to swallow the large *Melastoma* berries and those of other tropical shrubs, on which alone they subsist; not on insects, as Cuvier asserts. Although, he adds, they perfectly resemble the swallows in the construction of their bills, their wings are not formed for rapid flight; and their feet are much stronger, and calculated for searching among branches for their food, in which situations Mr. Swainson frequently saw them. The species noticed is, he observes, a scarce bird; he met with it only three times in Bahia; but he says that it appears more frequent in the southern provinces of Brazil, specimens having been sent to him from Minas Geraes and Rio de Janeiro.

Procnias ventralis. (Sw., *Zool. Ill.*)

PROCONSUL. [CONSUL; PROVINCIA.]

PROCO'PIUS, ANTHE'MIUS, by which latter name he is best known in history, a grandson of Anthemius, who was minister of Arcadius and of Theodosius II., was proclaimed emperor of the West by the nomination of Leo I., emperor of the East, and with the consent of Ricimer, a chief of Suevian and other barbarian mercenaries in the service of the empire, who had assumed the supreme military authority over Italy after the death of Severus. As a condition of his consent, Ricimer obtained the hand of the daughter of Anthemius. After a few years Ricimer quarrelled with his father-in-law, and marched against him. The emperor Leo dispatched the patrician Olybrius to Italy to mediate a peace, but Olybrius, being offered the crown by Ricimer, was tempted by the offer and accepted it. Anthemius, though forsaken by most of his followers, made a stout resistance outside of Rome, but he was defeated and killed, A.D. 472, after five years' reign.

Coin of Procopius.
British Museum. Actual size.

PROCO'PIUS was born at Cæsarea in Palestine, about the end of the 5th or beginning of the 6th century. After studying rhetoric in his native country, he went to Constantinople, where he gave lessons on rhetoric, and appears to have practised also as a lawyer, for such he is styled in the title of some of his works. His reputation for learning and ability reached the court; and the emperor Justin the Elder, in the last year of his reign, appointed him assessor (συγκάθεδρος) to Belisarius, who was about that time sent as governor to Dara on the frontiers of Armenia. Procopius afterwards accompanied that commander in his first war against the Persians (A.D. 530), afterwards in that against the Vandals in Africa (533-5), and lastly against the Goths in Italy (536-9). During these campaigns he appears to have rendered himself very useful through his abilities and activity, and to have been entrusted by Belisarius with important commissions connected with the service of the army. In his capacity of assessor, he was the general's legal adviser, and he was also his private secretary. In the year 538, he assisted Antonina, the wife of Belisarius, in

* In ASTRONOMY, p. 538, for 'Proclus Diadochus (not the commentator of Euclid), A.D. 550, read 'Proclus Diadochus (the commentator of Euclid), A.D. 450.'

raising troops in Campania, and in sending some by sea to Rome, which was then besieged. On his return to Constantinople, about the year 540, the emperor Justinian made him a senator, as a reward for his services. In 562, he was made prefect of Constantinople, unless perhaps it was another of the name who obtained this dignity in the year 562. He died in that city at an advanced age, but the precise year of his death is not ascertained.

Procopius wrote the 'History of his own Times,' in eight books, which has been translated into Latin by Claude Mattret, a jesuit. 'Procopii Cæsariensis Historiarum sui Temporis Libri Octo,' fol. Paris, 1662, with the Greek text. The work has also been translated into Italian, German, and other modern languages. There is a German translation, with notes, by Kanngiesser, Greifswald, 1827-29, 3 vols, 8vo. The 'History' of Procopius is an important work, which forms the connecting link between antient and modern history, between Ammianus Marcellinus and the Byzantine historians. Procopius was well informed and unprejudiced; he was a spectator of, or an actor in, most of the events which he narrates; he was well acquainted with the court of Justinian; and he is generally trustworthy, except perhaps where he stoops to the customary flatteries towards the emperor, the empress Theodora, and his patron Belisarius, for which flattery however he has made ample amends in his secret history of the same personages. His descriptions of the manners of the various barbarous nations which invaded the Roman empire are vivid and interesting. The first two books of his history concern the Persian wars. He begins his narrative with the death of Arcadius, and briefly relates the wars between the Romans and Persians under Theodosius the Younger, Anastasius, and Justinus, and lastly Justinian. As he comes down to contemporary times, his history is more diffuse. He brings his narrative down to the 23rd year of Justinian's reign, A.D. 550. Books 3 and 4 treat of the wars of the Vandals in Africa, and the reconquest of that province by Belisarius. The 5th, 6th, and 7th books are concerned with the history of the Gothic kingdom in Italy founded by Theodoric, and the expedition of Belisarius against Totilas. The 8th book is of a mixed character; it resumes the account of the Persian wars, then speaks of the affairs of the Roman empire in other quarters, in Africa, on the Rhine, and in Thrace, and at last it resumes the narrative of the Gothic war in Italy, the expedition of Narses, the defeat and death of Teia, and the final overthrow of the Gothic kingdom.

A second volume, published likewise at Paris, in 1563, contains two other works of Procopius, in the Greek text, with a Latin translation. One contains an account of the public buildings erected or restored by Justinian throughout the empire, 'De Ædificiis Domini Justiniani Libri VI.' It is written in a laudatory style, but contains much valuable topographical information.

The other work of Porcopius is entitled 'Anecdota, or Secret History,' in thirty chapters. The character of this book has been noticed under JUSTINIANUS. Justinian and Theodora are here painted in the darkest colours. Procopius says that he wrote it to complete his 'History,' in which he could not, through fear of torture and death, speak of living persons as they deserved. Some grossly obscene passages concerning Theodora, who was evidently a very bad woman, have been expunged in most editions. There seems little doubt that Procopius is the author of the work. The Paris edition of Procopius, already quoted, is enriched with copious historical notes, prefaces, and an index.

PROCTOR, an officer of the Ecclesiastical courts, whose business is that of an agent between his clients and the courts to which he is attached. He stands in a similar situation to that of an attorney at common law, or a solicitor in chancery. There are about 120 proctors now practising in the several courts of Doctors' Commons, London, which are four in number, the Court of Arches, the Prerogative Court, the Consistory or Consistorial Court of the Bishop of London, and the Admiralty Court.

In commencing a suit in any of these courts, the proctor is appointed by a proxy executed by the client, by which he constitutes him his agent, and promises to confirm all his acts as by law required in such suit. The proctor then proceeds to collect the facts of the case, and to apply to the court, in his client's behalf, to draw allegations and interrogatories, and summon witnesses, whose evidence is taken down in private by the examiners, who are proctors appointed for that purpose. This evidence is deposited in the registry of the court in which the suit is brought, and is not allowed to be seen by any party until such time as the court may think fit to order publication. No *vivâ voce* evidence is received in these courts. After the necessary information has been collected and arranged, the proctor prepares his client's case, to be put into the hands of the advocates, to be by them brought before the court, if they deem it advisable.

In the case of wills, or administrations with the will annexed, that is, where the deceased has left a will, but has not appointed any executor, the executors or administrators are sworn to the due execution of the will of the deceased; and they make affidavit as to the amount of property, time of death, &c. The proctor then makes a copy of such will or papers, and places it before the registrar of the court to be compared with the original; the copy, when thus compared, is returned to him with the probate under seal of the court attached. In cases of administration, he delivers in a formal account of the claims of the parties who apply for letters of administration, with an affidavit as to the value of the property and other particulars, and prays the court to decree letters of administration also under seal of the court. These instruments are then delivered to the executors or administrators, and are their authority for distributing the property of the deceased according to his will, or, in the absence of a will, according to law.

It is also the business of the proctor to obtain licences for marriage, on the application of either of the parties about to contract such marriage, and to draw an affidavit in which the party applying for the licence declares that he or she knows of no legal impediment to such marriage. It is the proctor's duty to explain the nature of this affidavit to his client, who is then sworn to the truth of it before one of the advocates, who are appointed surrogates, or deputies of the judge. The affidavit is then lodged in the Faculty Office, or office of the vicar-general, and licence obtained under seal: this licence remains in force for three months.

The proctor in many cases has to attest the acts of his client, and for this purpose he is appointed a notary public, but his power as such extends only to proceedings in his own courts, and not to the general business of a notary. The official title of a proctor is 'notary public, and one of the procurators-general of the Arches Court of Canterbury and of the High Court of Admiralty.'

The number of the proctors is prevented from increasing very rapidly by the restrictions on taking 'clerk apprentices:' only the thirty-four senior proctors, and of them only such as are of five years' standing in such seniority, are allowed to take an articled clerk, and in no case to take a second until the first has served five years, and then only by permission of the court. The term of articleship is seven years, which is legally required on account of the notarial capacity in which they have to act. Notwithstanding these regulations, the number has materially increased. In the time of Charles II. there were only thirty-four procurators-general and ten supernumeraries. The proctors wear a gown as a badge of office in court, and in the Arches a cape trimmed with ermine in addition; and on certain occasions, such as upon admission or attending prayers on the first day of Term, a wig similar to that of a barrister. They are exempted from serving as jurors or parish officers.

The appeal from these courts is to the Judicial Committee of the Privy Council, where the proctor conducts the case in the same way as in the courts of Doctors' Commons, but is obliged to call to his assistance a barrister, in addition to an ecclesiastical advocate. There is an appeal court held in Doctors' Commons, but it is only for business preliminary to the cause being heard before the Privy Council.

The courts are held in the common hall of Doctors' Commons, situated in the College, in which are the official residences of the judges and advocates. The proctors have no inn, or regular locality, but are very inconveniently dispersed about the narrow streets near the College.

Attached to the courts of the province of York and to the different bishops' courts are similar bodies of proctors, who differ only in trifling circumstances from those here described. [PROCURATOR.]

PRO'CULUS, one of the tyrants or pretenders to the empire who rose after the death of Tacitus. He was a native of Liguria, and originally a chief of robbers, but afterwards served in the army with distinction under Aurelian, and showed himself a brave though rude soldier. He was proclaimed emperor in Gaul, and fought against the Germans, but being attacked by Probus, who was acknowledged emposed by the senate, was defeated and killed, A.D. 278. (Vopiscus, *Historia Augusta*.)

PROCURA'TOR, a manager or agent, whence the word *proctor* is formed.

A Roman procurator was a person appointed by another to manage or conduct a cause for him. It required no particular words to constitute a man a procurator; nor was it, as in the case of a *cognitor*, necessary for the opposite party to consent to his appointment. A man might commence a suit as a procurator, without showing his authority; but it seems that he was obliged to produce it before the judges came to a decision, or to enter into security that the plaintiff would abide by his acts. (Gaius, iv. 84.)

Under the Empire the governor of a province was, in certain cases, called a Procurator, or Procurator Cæsaris. Sometimes this Procurator had not the government of a province, but only managed affairs of revenue (res fisci). [Provincia.]

PROCYON. (Astronomy.) [Sirius and Procyon.]

PROCYON. (Zoology.) [Raccoon.]

PRO'DICUS, a native of Ceos, or, as some think, of Chios, flourished B.C. 435. He was a disciple of Protagoras, became a celebrated Sophist, and had among his followers Socrates, Euripides, Isocrates, and Xenophon. Prodicus travelled through Greece from town to town, to deliver his lectures, for which he demanded payment of his hearers, sometimes to an extravagant amount. Several ancient writers refer to these lectures, or harangues, as worthy of a philosopher. Prodicus however is reported to have been put to death by the Athenians, because they thought that he corrupted the youth by his teaching; and it is further remarkable that he is numbered among the atheists by Cicero (*De Nat. Deorum*, i. 42). None of the writings of Prodicus are extant except a beautiful episode preserved by Xenophon (*Mem.*, ii. 1), usually called 'The Choice of Hercules.' This has been paraphrased in English verse by Shenstone and by Bishop Lowth; and there is a prose translation in the 'Tatler.' Three others of this name are noticed by Fabricius, but very little concerning them is known. (*Fabricius, Bibliotheca Græca.*)

PRODUCT, a term really equivalent to result, but used only when the result is the one obtained by the multiplication of two or more quantities.

PROFANENESS. [Blasphemy.]

PROFESSION, PROFESSED. [Monk.]

PROFIT, one of the three parts into which all that is derived from the soil by labour and capital is distributed, the other two being wages and rent: from these three sources arise all the revenues of the community. Profit is therefore the surplus which remains to the capitalist after he has been reimbursed for the wages advanced and the capital consumed during the process of production. To obtain this surplus is the only object for which capital is employed.

Profits have a tendency to fall to the same level in all branches of industry; for if the rate of profit in proportion to the capital employed be greater in one than in another, more capital will be directed to that which affords the highest profit; and the powers of production being increased, the supply is greater, prices fall, and the equilibrium of profit is restored. A distinction must however be made between real and apparent profit. When the employment of capital is attended with extraordinary risk, profits are nominally high; but after deducting the losses to which it is exposed, the real profits tend to the same level as the ordinary rate. The case is similar in occupations of a disagreeable or agreeable nature, the pleasantness of the latter counterbalancing the low rate of profit. A wholesale merchant and a retail trader both dealing in the same commodities may appear to obtain different rates of profit; but in the latter case wages are confounded with profits, and when they are properly distinguished, the apparent disproportion is diminished. Unless we reduce profits from their apparent to their real value, there is no truth in the maxim that the rate of profit is uniform in the same country at the same time. In different stages of society the rate of profit is subject to certain changes. In all new countries the employment of capital is attended with large returns, and profits are high. As population advances, it becomes necessary to cultivate land of inferior degrees of fertility, or to apply more capital to the land already cultivated. The labourer receives a greater proportional share of the produce, though it may be less absolutely than before this change took place; and more capital being necessary to obtain the same quantity of produce, the proportion of profit to the capital employed is therefore less; that proportion of the produce which is distributed as rent increases.

The natural tendency then of profits (whether arising from capital employed in agriculture or in manufactures) is to decline as the necessities of the population render it necessary to have recourse to inferior soils. Happily, improvements in machinery and in the art of agriculture, better combinations of labour and capital, and greater freedom of commerce, are calculated to arrest this retrograde movement; and to such sources of relief every highly advanced country must look as a means for sustaining its prosperity; for whatever diminishes the necessity of raising food from the poorer soils, tends to maintain the rate of profit.

Two other causes have great influence upon the rate of profit, namely, wages and taxation. A rise in wages will diminish profits, unless industry becomes more productive; but if the latter take place, both may rise at the same time, either in the same or in different proportions according to circumstances.

Taxation will diminish profits, unless wages fall or industry become more productive. Taxes on profits, when they fall alike upon all capital engaged in productive industry, are paid by the owners of capital, who have not the power of charging the tax upon consumers. Consumption is checked and the power to accumulate diminished. When the profits of only certain classes of traders are taxed, they would betake themselves to other occupations not taxed, unless they could charge the consumers with the tax: the tax therefore falls upon the consumers.

The effect of the competition of capitalists in reducing the rate of profit has not been much discussed by writers on political economy. Mr. M'Culloch says:—'Competition cannot affect the productiveness of industry, and therefore has nothing to do with the average rate of profit.' In reply to this assertion it has been remarked (*Edin. Rev.*, No. 142, p. 447) that although the inferior fertility of newly cultivated soils be the immediate cause of the diminution of the rate of profit, yet it is nothing but the competition of capitalists which drives capital to seek the inferior soil, and induces its owners to be content with a lower rate of profit. The capitalists who had accumulated at the old rate of profit are content with a new investment producing a lower rate, instead of consuming their savings unproductively.

(Ricardo, *Principles of Political Economy and Taxation*, chaps. v. and xiii.; Mill, *Elements of Political Economy*, c. ii., sec. 3; and c. iv. sec. 6; M'Culloch's ed. of the *Wealth of Nations*, note vii.; *The Laws of Wages, Profits, and Rent investigated*, by Professor Tucker, Philadelphia, 1837.)

PROGNO'SIS (in Medicine) is the opinion formed respecting the probable future events of any disease, as, for example, whether it will terminate in recovery or in death, how long it is likely to continue, what other diseases may be expected to arise in its course, what are the chances of relapse, and what those of some permanent injury of structure or function being produced by the morbid processes.

PROGRESSION. A series of numbers following any law should be called a progression, but the word is usually restricted to two sorts of progression, which are called, but by no means correctly, arithmetical and geometrical: the analogies pointed out in Rectangle give the origin of these terms.

An *arithmetical progression* is one in which the terms continually increase or diminish equally, including, as an extreme case, that in which they do not increase nor diminish at all. Thus

$$7,\ 7,\ 7,\ 7,\ \&c. \qquad 7,\ 8,\ 9,\ 10,\ \&c.$$
$$10,\ 9\tfrac{1}{2},\ 9,\ 8\tfrac{1}{2},\ \&c. \qquad 2,\ 3\tfrac{1}{4},\ 4\tfrac{1}{2},\ 5\tfrac{3}{4},\ \&c.$$

are sets of terms in arithmetical progression. The following proposition contains the principal part of their theory:—

If a be the first term of an arithmetical progression, and Δa the difference between any two terms (negative, if the terms diminish); and if a_n be the nth term from and after a *exclusive*, and S_n the sum of n terms, we have

$$a_n = a + n\,\Delta a;$$
$$S_n = na + n\,\frac{n-1}{2}\,\Delta a.$$

From these two equations between a, n, a_n, Δa, and S_n, any three of these being given, the other two can be found, subject however to this restriction, that the problem is unmeaning when n is not a whole number, whether it be given or found. These theorems are only the simplest case of a more general pair, in which, taking any series, and supposing neither the differences nor the differences of the differences, &c. to be equal, an expression is given for any term of a series, or for the sum of n terms, which frequently gives finite forms in the place of indefinite ones. Calculate, as in the article DIFFERENCE, the value of Δa, $\Delta^2 a$, &c., from a, a_1, a_2, &c., and let

$$n_1 = n,\quad n_2 = n\frac{n-1}{2},\ n_3 = n\,\frac{n-1}{2}\,\frac{n-2}{3}, \text{ \&c.}$$

Then
$$a_n = a + n_1\Delta a + n_2\Delta^2 a + n_3\Delta^3 a +, \text{ \&c.}$$
$$S_n = n_1 a + n_2\Delta a + n\ \ \Delta^2 a + n_4\Delta^3 a +, \text{ \&c.}$$

Thus in the series $1 + 5 + 17 + 43 + 89 + 161 +$ &c., the law of whose terms is undiscoverable at first sight, we shall, by what the beginner may, till he knows better, call an accidental circumstance, discover both the law of the terms and that of their sum, as follows:—

1					
	4				
5		8			
	12		6		
17		14		0	
	26		6		0
43		20		0	
	46		6		
89		26			
	72				
161					

$a = 1$, $\Delta a = 4$, $\Delta^2 a = 8$, $\Delta^3 a = 6$, $\Delta^4 a = 0$, $\Delta^5 a = 0$, &c.

$$a_n = 1 + 4n_1 + 8n_2 + 6n_3 = n^3 + (n+1)^2$$
$$S_n = n + 4n_2 + 8n\ \ + 6n_4$$
$$= \left(n\frac{n-1}{2}\right)^2 + \frac{n(n+1)(2n+1)}{6}.$$

Thus the seventh term (the sixth after 1, $n = 6$) is $6^3 + 7^2$, or 265, and the sum of 6 terms (make $n = 6$ in the second formula, in which remember that S_n is the sum of n terms, not of n terms after a) is $(\frac{1}{2}.6.5)^2 + \frac{1}{6}.6.7.13$, or 316, which may easily be verified. [SUM.]

The apparently accidental circumstance above alluded to, is the vanishing of all the differences of a from and after the fourth. But it is to be observed, that the series was originally constructed so as to make all differences vanish after the fourth, and that the preceding theorem will never change indefinite into definite formulæ, except when all differences after a certain one vanish. The rule is, when a_n is an algebraically rational and integral function of n of the p order, that is, of the form $kn^p + ln^{p-1} +$, &c., all differences after the pth vanish, and then only.

Geometrical progression is when the terms of a series increase or diminish by the use of the same multiplier, whole or fractional, including, as an extreme case, that in which the multiplier is unity. Thus, the multipliers being 1, $\frac{8}{7}$, $\frac{1}{4}$, and 2, the four following sets of terms are in geometrical progression:—

$$7,\ 7,\ 7,\ 7, \text{ \&c.} \qquad 7,\ 8,\ \tfrac{64}{7},\ \tfrac{512}{49}, \text{ \&c.}$$
$$3,\ \tfrac{3}{4},\ \tfrac{3}{16},\ \tfrac{3}{64}, \text{ \&c.} \qquad 9,\ 18,\ 36,\ 72, \text{ \&c.}$$

If a be the first term, and b the second, the nth term is $a(b \div a)^{n-1}$, and the sum of n terms is

$$\frac{a^n - b^n}{a^{n-2}(a-b)} \quad\text{or}\quad \frac{b^n - a^n}{a^{n-2}(b-a)},$$

according as a is greater than or less than b. But when $a = b$, the sum is of course na. If $b \div a = r$, that is, if the terms be a, ar, ar^2, ar^3, &c., the nth term is ar^{n-1}, and the sum of n terms is

$$a\frac{1-r^n}{1-r} \quad\text{or}\quad a\frac{r^n-1}{r-1},$$

according as r is less than or greater than one. If r be less than one, the series of terms, however far it may be carried, never reaches $a \div (1 - r)$, though it may approach this limit with any degree of nearness by making the number of terms sufficiently great.

Thus the following equations,

$$2 = 1 + \tfrac{1}{2} + \tfrac{1}{4} + \tfrac{1}{8} + \tfrac{1}{16} + \text{ \&c.}$$
$$1 = \tfrac{2}{3} + \tfrac{2}{9} + \tfrac{2}{27} + \tfrac{2}{81} + \tfrac{2}{243} + \text{ \&c.}$$

thougn always erroneous, stop where we may, yet can be brought as near to truth as we please by writing down terms enough on the second side. In the use of the word INFINITE, as explained in the article on that subject, we may then say that the above equations are absolutely true, if the series be carried *ad infinitum*. The general equation, made absolutely true, after stopping at ar^n in the series, is

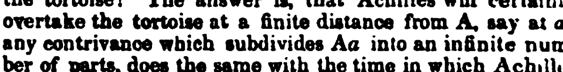
$$\frac{a}{1-r} = a + ar + \ldots + ar^n + \frac{ar^{n+1}}{1-r}.$$

Other points connected with this equation will be mentioned in the article SERIES.

There is no doubt that every whole can be subdivided into parts without limit, or, in common language, can be divided into an infinite number of parts. An old fallacy, mentioned in MOTION, receives its explanation from the preceding. If we make $a = 1 - r$, the equation carried *ad infinitum* becomes

$$1 = (1 - r) + (1 - r)r + (1 - r)r^2 +, \text{ \&c., } ad.\ inf.$$

By giving different values to r, we have therefore an infinite number of ways of subdividing unity into an infinite number of parts. If then we take a problem in which an antecedent is followed by a consequent; and if dividing the antecedent into an infinite number of parts, we consider separately the parts of the consequent which belong to those of the antecedent, we shall of course divide the consequent into an infinite number of parts. It would be a gross fallacy to infer that the consequent must be infinitely great, because it is produced in a never-ending succession of parts, since that never-ending succession was produced by dividing the avowedly finite antecedent into an infinite number of parts. No one could fail to detect the following: 'Let M be divided into an infinite number of parts, a, b, c, &c.; let each of these parts be doubled; then the result is made up of $2a$, $2b$, $2c$, &c., *ad infinitum;* consequently $2a + 2b + 2c +$, &c., being made up of an infinite number of quantities, is infinite.' Nevertheless this fallacy was not only produced in an ingenious form, as a sophism [MOTION], but has even reappeared in modern times as a serious argument. The sophism is known by the name of 'Achilles and the Tortoise.' The swiftest of men runs after the slowest of beasts, without (says the sophism) the possibility of ever overtaking it. For if, when they set out, Achilles be at A and the tortoise at T, then by the time Achilles has run over AT, how fast soever he may run, the tortoise will have gone over some length, say TB; while the hero goes over TB, his dinner (for dinner he may have out of it, in spite of the sophism) goes over BC, and so on *ad infinitum*. How then, asks the objector, is it possible that



Achilles can ever come up with the tortoise, since it is unquestionable (and this is perfectly correct), that let him go as far as he may, he must always come up to where the tortoise was before he can reach the point at which he is; so that it requires *an infinite number of parts of time* (but here the sophism quietly introduces *an infinite time*) to catch the tortoise? The answer is, that Achilles will certainly overtake the tortoise at a finite distance from A, say at a: any contrivance which subdivides Aa into an infinite number of parts, does the same with the time in which Achilles runs over Aa; and there is no more reason to say that the time is therefore infinitely great, than to say that Aa is made infinitely great by the subdivision. This would be a sufficient answer, since it would throw upon the sophist the *onus* of showing that the infinite number of parts of time makes an infinite time; but a more complete answer consists in positive proof that it is not so, as follows:—

Let AT be called a, and let Achilles move m times as fast as the tortoise; then TB is necessarily the mth part of AT, BC of TB, CD of BC, &c. Hence, if t be the time in which Achilles moves over AT, this time, added to his times of going over TB, BC, CD, &c., or t, $t \div m$, $t \div m^2$, &c., make up

$$t\left(1 + \frac{1}{m} + \frac{1}{m^2} + \frac{1}{m^3} + \frac{1}{m^4} +, \text{ \&c., } ad\ inf.\right)$$

Now if m be greater than 1 (for unless Achilles move faster than the tortoise, it is admitted he can never catch it), the series above named is $1 \div \left(1 - \frac{1}{m}\right)$, so that the whole time is $tm \div (m-1)$, and the whole length Aa is $am \div (m-1)$, the same answer as would be produced by common methods. The sophism divides this length into the infinite number of parts

$$a \qquad \frac{a}{m} \qquad \frac{a}{m^2} \qquad \frac{a}{m^3} \qquad \text{\&c.;}$$

and taking the times due in each;

$$1 \quad \frac{1}{m} \quad \frac{1}{m^2} \quad \frac{1}{m^3} \quad \&c.,$$

assumes the sum of the latter to be infinite.

In the work of a celebrated political economist there is the following argument, to show that a tax on wages must fall on the labourer; for if it did not so fall, wages would rise, whence the price of goods would rise, which would again cause a rise of wages, and this again a rise in goods, and so on *ad infinitum*, which is inferred to be absurd. This is of course precisely a repetition of the preceding case; and granting all the premises, the conclusion by no means follows. For that conclusion is that the rise would go on without limit, which need not be the case.

PROHIBITION, a writ to prohibit a court and parties to a cause then depending before it from further proceeding in the cause. It will be convenient to define,—1, out of what courts it may issue; 2, to what courts it may be addressed; 3, under what circumstances it is grantable; 4, at whose instance it may be obtained; 5, at what time it may be obtained; 6, the form and incidents of the proceeding.

1. A writ of prohibition may issue from any of the three superior courts of common law at Westminster, and also from each of the common-law courts of Chester and Lancaster. It is generally stated that a writ of prohibition may issue from the Court of Chancery; but the Court of Chancery acts by injunction addressed only to the parties, and does not interfere with the court. [INJUNCTION.]

2. It may be addressed by any of the three superior courts to any other temporal court; such as to the Admiralty courts, to courts martial, a court baron, any other inferior court in a city or borough, to the Cinque-Ports courts, the duchy or county palatine courts, the chancery of Chester, the Stannary courts, the Court of Honour of the Earl-Marshal, to the Commissioners of Appeals of Excise, to any court by usurpation without lawful authority, or to a court whose authority has expired. When any one has a citation to a court out of the realm, a prohibition lies to prevent his answering. It seems also that it might issue to the Court of Exchequer and to the Court of Common Pleas; but not to the Court of Chancery, nor is there any instance of a prohibition to the King's Bench. It may be granted by any of the three superior common-law courts to any spiritual court, and by the common-law courts of Chester and Lancaster to the spiritual courts within the county palatine and duchy.

3. The writ is grantable in all cases where a court entertains matter not within its jurisdiction; or where, though the matter is within its jurisdiction, it attempts to try by rules other than those recognized by the law of England. Matter may be said to be not within the jurisdiction of a court in two senses: 1, when the subject-matter entertained is in its nature not cognizable by the court; 2, where the subject-matter is in its nature cognizable by the court, but lies out of the local district where only that court has jurisdiction; or, in the case of a court whose jurisdiction is general, when the subject-matter lies in a local district exempt from the general jurisdiction of the court, or where the subject-matter of the cause relates to persons over whom the court has no jurisdiction.

In order to ascertain those cases which fall under the first head, we must consider the nature and character of the subject-matters over which the jurisdiction of the court extends. It is obvious, that if we have these clearly defined, we shall see whether the subject-matter in question is or is not within that jurisdiction. This general rule may be useful, because the cases that may occur in which a prohibition will lie, are endless. The examples of those which have occurred will assist in the application of it. To begin with those relating to temporal courts. A prohibition will lie if one sue another in a court-baron, or other small court not a court of record, for charters concerning inheritance or freehold; or in the county court for trespass *vi et armis*; or in the county courts or courts baron for a matter of 40s. or upwards,—and the plaintiff cannot evade the prohibition by dividing his demand into smaller sums; to the courts of Admiralty, if they entertain questions of a contract made or to be executed within the kingdom; to an inferior court, if an action be brought in it on a judgment in one of the superior courts; to the court of honour of the earl-marshal, "if it holds plea of things determinable by the common law." To a spiritual court a prohibition will lie, if it takes cognizance of any plea concerning a title to lands or tenements, or an advowson of a church, or an office, or goods, money, or chattels; and this applies even in the case of goods or ornaments given to a church, or matters of a criminal nature punishable only temporally; in short, as it has been said, anything for which a remedy exists at common law. Yet it has been held that a pension which commenced by the grant of the patron or ordinary may be sued for either in the temporal or spiritual court. Lord Coke however goes further, and says that prohibition lies to a spiritual court in any case, though of a spiritual nature, where a remedy is given by statute in a temporal court, unless the jurisdiction of the spiritual court is saved by the same statute. Perhaps this assertion cannot be maintained to the full extent. In some cases it has been so held, as where a suit in an ecclesiastical court was instituted for preaching without licence or marrying without banns, these having been created offences by act of parliament. Still a prohibition does not lie in a suit for small tithes or for contribution to the repairs of the church, though other remedies are given in those cases by statute (7 and 8 Wm. III., c. 6, and c. 34), and perhaps in some other cases. In cases where no remedy exists elsewhere, a spiritual court may still be restrained from entertaining questions as to matters not within its jurisdiction.

With regard however to the spiritual courts, various exceptions and restrictions must be applied to what has been said. A spiritual court can hold plea for goods, money, and chattels to which a spiritual character attaches; as for instance, tithes, provided they are under a fourth part of the value of the church, or oblations, mortuaries, &c., that is, payments by communicants, or payments for marriages, christenings, churchings, and burials, or pensions; or a sum promised to be given as a marriage portion. It can also hold plea for matters testamentary, such as a legacy, even of a chattel real. Though a will disposes of land as well as personalty, the granting of probate belongs to the spiritual court; but this grant in no way determines the validity of the will so far as relates to the land. A spiritual court has also jurisdiction as to offices merely spiritual, but not for lay offices, even though they are in the spiritual court. It has also jurisdiction over offences committed within the spiritual court itself, as perjury or extortion in all officers of the court, or for brawling and committing a nuisance within a churchyard, or for defamation where no damages are demanded, or where a crime either merely or in part spiritual is imputed, or the words spoken are mere words of passion. Where violence has been done to a spiritual person, he may maintain a suit in the ecclesiastical court, to punish the party by ecclesiastical censures. The spiritual court also has cognizance of a suit for maintaining a way to the church, or where the question is not of a right of way generally, but solely as to the right of way to a church, or a way by which a parson carries off his tithes.

Prohibition lies equally both where the matter of the suit is not cognizable by the court, and where, though the substance is cognizable, matter arises during the progress of it, and is clearly about to be tried, over which the court has no cognizance. As to this, perhaps some confusion and contradiction will be found in the authorities. It has been said that where a suit is brought in the spiritual court for a thing within the cognizance of that court, and temporal matter becomes *incident*, it shall be determined there, and there can be no prohibition. (12 Co., 65.) However this must always have been understood with the condition, that as to such things the ecclesiastical court was bound to try according to course of common law. Perhaps it was only applicable to cases where parties neglected to apply for prohibition till after sentence, and where no want of jurisdiction appeared on the face of the proceedings. More recent cases have clearly established that if in a cause properly cognizable by a spiritual court a question arises and is necessarily about to be tried as to the existence of a custom, or a prescription, or the limits of a parish, or where in a suit for tithes there is plea of a modus, or that the lands are discharged by statute, or tithes are claimed of things for which no tithes are due, or the defendant makes title by lease, &c., a prohibition will lie immediately.

It has been laid down broadly that the ecclesiastical courts cannot try any matter triable at common law. It is otherwise however where the construction of a statute may come in question: prohibition will not lie on the mere suggestion that the spiritual court is not competent to construe it.

A prohibition is in all cases grantable where a court allows illegal or disallows legal evidence, as where the commissioners of appeals for the excise determine by the minutes of evidence taken by a justice of the peace, instead of examining the witnesses vivâ voce, or a spiritual court disallows proof of payment, &c. because proof of it is made only by a single witness, or where it has misconstrued an act of parliament, or disallows an award when it is good by law.

Where a suit is for matter within the cognizance of the court, which is combined with things over which the court has no cognizance, prohibition will issue as to that over which the court has no cognizance. But in those cases where both parties to the suit are spiritual persons, as where the question is whether the tithes belong to the rector or the vicar, no prohibition lies.

Where the matter is cognizable by the court, but lies out of its local jurisdiction, the question is merely one of boundary; as in cases where an inferior court holds plea of matter out of its limits, the duchy courts or courts palatine of land out of the duchy, &c. This is also the case where one spiritual court trespasses on the district of another, as if a man resident in one diocese or peculiar be cited to appear in another; in this case it is however to be observed that no prohibition will lie if the proper ordinary refuses or neglects to act in the case, or is party to the suit, or, under certain circumstances provided for by the canons, refers the matter to his immediate superior.

A prohibition will also lie where a court attempts to extend its jurisdiction to parties over whom it has none, as where a court-martial inquires into the conduct of a person not a soldier or sailor; the Stannary courts, where neither parties are tinners, nor the matter in question respecting tin, &c.

4. A prohibition may be obtained at the instance of either party to an ecclesiastical suit. In the case of a suit for tithes against a lessee, it may be obtained by the reversioner. Where a court has no jurisdiction over the matter of the suit, a prohibition is grantable at the request of a mere stranger.

5. If a court has no cognizance of the matter of a suit, prohibition will lie immediately after appearance, and it may be obtained by either plaintiff or defendant at any future time, even after sentence, appeal, and affirmation; or after judgment and execution, provided it appears by the libel, or by the libel and the proceedings, that the court had no jurisdiction. Where the court has cognizance of a cause, prohibition will not lie until the matter out of its jurisdiction has not only arisen, but is also clearly in progress of being tried. If that matter is then admitted by the litigant parties, the court is still entitled to entertain cognizance of the suit. If not admitted, and these circumstances, though not appearing on the face of the proceedings, are duly brought forward before sentence, a prohibition will then lie. If however a prohibition is not then applied for, but the party submit to the trial in the court where the suit has been commenced and sentence is pronounced, no prohibition will lie unless it appear on the libel, or the libel and the proceedings, not only that matter out of the jurisdiction of the court has arisen, but also that the matter has been wrongly decided. (Gould *v.* Gapper, 5 East, 345; Byerly *v.* Windus, 5 B. & C. 1.) If a spiritual court has cognizance of part of the charge and not of the rest, the court will not grant a prohibition after sentence. In cases where the suit is determined, it would appear that these observations can at all events only apply to permanent courts, and where something still remains to be done. In the case of an occasional court, as a court-martial, it would be impossible to carry the prinsiple into execution.

6. A writ of prohibition is applied for by motion in court, which sets out the proceedings in the suit. If the proceedings are not sufficient to show the want of jurisdiction in the court against which prohibition is prayed, suggestions must be added, verified by affidavit, showing such want of jurisdiction.

If the court grants a rule, the other party is heard in answer. The court may then decide, either to refuse the prohibition, or, if they incline to grant it, direct the party applying to declare in prohibition. The mode of doing this is regulated by 1 Will. IV., c. 21. The declaration must contain a concise statement of the grounds of the application, and conclude by praying that the writ may issue. To this the other party may demur on the ground that no sufficient cause appears for a prohibition, or he may plead such matters as he thinks proper to show that the writ ought not to issue, and conclude by praying that it may not issue. If matters of fact are put in issue, they are tried by a jury. Judgment is given either on the demurrer or after nonsuit or verdict. The party succeeding is entitled to the costs of these proceedings, and, if a trial takes place, the jury may assess damages. If the court decide in favour of the party applying, the writ issues and forbids the court and other party from further proceeding. In such case, if the ground of application was that the court had no jurisdiction at all in the suit, the writ of prohibition is final. But, if the ground is that something had arisen not cognizable by the court, during the progress of a suit, concerning a matter properly within its jurisdiction, the prohibition is not final. In such case the question is referred to the proper tribunal for trial, and if found against the applicant, the suit may be then resumed. In either case, where the court decides in favour of the party against whom prohibition is prayed, or the verdict has been afterwards in his favour, the court awards a consultation, as it is called, by which the cause is again remitted to the original court. If parties proceed after a writ of prohibition has been obtained and served, they are liable to an attachment for contempt. No prohibition for the same matter lies after a consultation has been awarded upon the merits.

(Comyns's *Digest*; Bacon's *Abridgment*; Viner's *Abridgment*; tit. 'Prohibition,' 2 *Inst.*, 599; 3 Bl. *Com.*, c. 7.)

The right of the common-law courts to issue writs of prohibition, and the mode in which they exercised that right, have often been the subject of great dispute between the common-law judges and the ecclesiastics. The latter have several times exhibited many articles of grievance before the parliament and privy council against the former. The most famous of these are the 'Articuli cleri,' exhibited by Archbishop Bancroft, in the name of the whole clergy, in the third year of the reign of James I. They are given at length by Lord Coke (2 *Inst.*, 599), with a full view of the nature of the controversy between the parties, and the unanimous answers of the judges.

PROITHERA. [Night-Jars, vol. xvi., p. 229.]

PROJECTILES, THEORY OF. This subject usually comprehends the investigation of the relations between the space described, the time of motion, and the velocity acquired by a body when impelled in any direction by some motive force.

The circumstances of a body descending from a high place towards the earth by the action of gravity, and those of a body projected vertically upwards from the earth, on the supposition, in both cases, that the body moves in a non-resisting medium, have been noticed in the article Fall of Bodies; and the circumstances attending the motion, both in a resisting and a non-resisting medium, of a body impelled by fired gunpowder, when the impulse is in a direction parallel or oblique to the horizon, have been investigated in the article Gunnery. It is intended therefore in this place only to consider the laws of the vertical ascent and descent of bodies in resisting media, the force of gravity, or of terrestrial attraction, being supposed to be constant; and in non-resisting media, under the condition that the force of gravity is variable.

Let a spherical body descend vertically from a state of rest in a resisting medium (air, water, &c.) supposed to be of uniform density; and let it be admitted, agreeably to the Newtonian hypothesis (*Princip.*, lib. ii., sec. 1; *Schol.*), that the resistance of the medium is proportional to the square of the velocity, v, acquired at any moment in the descent; then, if we suppose U to be the velocity which a body falling towards the earth in the resisting medium would acquire when that resistance becomes equal to the accelerative force of gravity, the latter being, as usual, represented by g ($=32{\cdot}2$ feet), we shall have $U^2 : g :: v^2 : \frac{v^2}{U^2}g$; and the last term represents the resistance of the medium at the instant when the velocity is v; hence the accelerative force by which the falling body is urged at such moment is expressed by $g - \frac{v^2}{U^2}g$.

Now s being the space descended by the body in the time t, and v being the velocity as before, an accelerative force is represented by $\frac{dv}{dt}$ and by $\frac{d^2s}{dt^2}$. [Force.] Therefore $\frac{dv}{dt} =$

$g - \frac{v^2}{U^2}g$; whence $g\,dt = \frac{dv}{1-\frac{v^2}{U^2}}$; and integrating this equation, observing that $v=0$ when $t=0$, we have $t = \frac{U}{2g}$ hyp. log. $\frac{U+v}{U-v}$, or $\frac{2gt}{U}$ = hyp. log. $\frac{U+v}{U-v}$; or again, passing from logarithms to numbers, $\frac{U+v}{U-v} = e^{\frac{2gt}{U}}$ (e being the base of the hyperbolic logarithms); whence $v = U\frac{e^{\frac{2gt}{U}}-1}{1+e^{\frac{2gt}{U}}}$, and this second member being developed, gives $v = gt - \frac{g^3t^3}{3U^2} + \&c.$ Substituting, in this equation, $\frac{ds}{dt}$ for v, and again integrating, we have $s = \frac{1}{2}gt^2 - \frac{g^3t^4}{12U^2} + \&c.$

These equations for s and v give the space descended and the velocity acquired at the end of any given time t from the moment when the motion commenced. For tables of the values of U (the terminal velocities) for iron balls, see Dr. Hutton's 'Tracts,' tract 37.

Next, let a body be projected vertically upwards in a uniformly resisting medium with an initial velocity $=V$; and let the body be of a spherical form so that U may be the same as before: then, the force of gravity and the resistance of the medium acting in a direction opposite to that of the projectile force, we have now $\frac{dv}{dt} = -g - \frac{gv^2}{U^2}$; whence $-g\,dt = U\frac{d.\frac{v}{U}}{1+\frac{v^2}{U^2}}$. This equation, being integrated, gives $-gt = U$ arc tan.$\frac{v}{U} + const.$; and considering that $v = V$ when $t=0$, the constant is equal to $-U$ arc tan.$\frac{V}{U}$; putting $-C$ to represent this term, we have $\frac{C-gt}{U}$ = arc tan. $\frac{v}{U}$; and passing from arcs to tangents, we have $\frac{v}{U} = \tan.\frac{C-gt}{U}$, or $v = U \tan.\frac{C-gt}{U}$. Multiplying both members of the last equation by dt, and putting dx for its equal $v\,dt$, this equation becomes $dx = U \tan.\frac{C-gt}{U}dt$; which integrated gives $x = \frac{U^2}{g}$ hyp. log. cos. $\frac{C-gt}{U} + const.$ The constant is determined by considering that $x=0$ when $t=0$; whence $const. = -\frac{U^2}{g}$ hyp. log. cos.$\frac{C}{U}$: therefore $x = $

$$\frac{U^2}{g} \text{ hyp. log. } \frac{\cos.\frac{C-gt}{U}}{\cos.\frac{C}{U}}.$$

Making $v=0$ in the above equation for v, we get the value of t when the body has attained its greatest height; and substituting the value of t so found in the last equation for x, we have that greatest height.

When arrived at the greatest height, the body would begin to return towards the earth; and it may be shown that the velocity acquired by the body on arriving at the place from whence it was projected would be less than the initial velocity; also that the time of the descent would differ from the time of ascent.

If we imagine the earth to be perforated in the direction of a diameter; and if a body be allowed to descend towards the centre in a non-resisting medium from any point in the line of perforation: the law of attraction being in such a case directly proportional to the distance of the body at any time from the centre of the earth (Newton, lib. i., prop. 73), the relation between the space descended and the time of descent may be thus investigated.

Let r be the radius of the earth, and let the force of gravity at the surface be represented by g; then x being any distance from the centre, the attracting force acting on the body at that distance will be $\frac{gx}{r}$. Therefore since the distance of the body from the centre diminishes, while the time reckoned from the moment of departure increases, we shall have $\frac{d^2x}{dt^2} = -\frac{gx}{r}$. This equation will be found to be verified by assuming $x = a\cos. t\sqrt{\frac{g}{r}} + b\sin. t\sqrt{\frac{g}{r}}$; which being differentiated once, gives $\frac{dx}{dt} = -a\sqrt{\frac{g}{r}}\sin. t\sqrt{\frac{g}{r}} + b\sqrt{\frac{g}{r}}\cos. t\sqrt{\frac{g}{r}}$. Now, in the equation for x, making $x = r'$ (any given distance from the centre) when $t=0$, we have $a=r'$; and in the equation for $\frac{dx}{dt}$, making $\frac{dx}{dt}$ (the velocity) $=0$ when $t=0$, we have $b=0$. Consequently $x = r'\cos. t\sqrt{\frac{g}{r}}$; whence x is found when t is given: but when $x=0$, we have $t\sqrt{\frac{g}{r}} = \frac{\pi}{2}$ (where π represents the half circumference of a circle whose radius is equal to unity) whatever be the value of r'. Therefore $t = \frac{\pi}{2}\sqrt{\frac{r}{g}}$ will express the time of falling from the surface to the centre of the earth.

Let it now be required to investigate the relations between the times, the spaces described, and the acquired velocities when a body falls in vacuo from a point at such a distance from the earth that the attraction of gravity upon it may be considered as variable; and when, agreeably to the law of nature, its intensity is inversely proportional to the square of the distance. (*Princip.*, lib. i., prop. 74.) Then, if r be the radius of the earth, p the distance from the centre of the earth to the point above the latter from whence the body is let fall; and if x be the space descended in any time t: also if g be the force of gravity at the earth's surface, we shall have $\frac{1}{r^2} : g :: \frac{1}{(p-x)^2} : \frac{r^2g}{(p-x)^2}$; and the last term expresses the force of gravity at the place of the body when the space descended is x and the time of descent is t: therefore $\frac{d^2x}{dt^2} = \frac{gr^2}{(p-x)^2}$.

In order to integrate this equation, multiply both sides of it by $2dx$; and then the first integral will be $\frac{dx^2}{dt^2} = \frac{2gr^2}{p-x} + const.$ The constant may be found on considering that $\frac{dx}{dt}$ (the velocity) $=0$ when $t=0$, when also $x=0$; therefore $const. = -\frac{2gr^2}{p}$, and $\frac{dx^2}{dt^2} = 2gr^2\left(\frac{1}{p-x} - \frac{1}{p}\right)$; whence $\frac{dx}{dt} = \sqrt{\left\{\frac{2gr^2}{p}.\frac{x}{p-x}\right\}}$. This equation may be put in the form $\frac{(p-x)\,dx}{\sqrt{px-x^2}} = \frac{2gr^2}{p}dt$; and by the rules of integration we have $t\sqrt{\frac{2gr^2}{p}} = \sqrt{px-x^2} + \frac{1}{2}p$ arc cos. $= \frac{p-2x}{p}$: there is no constant to be added, because $x=0$ when $t=0$. From this equation t may easily be found when x is given: likewise from the equation for $\frac{dx}{dt}$ we have the velocity when x is given. And if x be made equal to $p-r$, the whole distance of the body from the surface of the earth, we shall obtain the whole time of the descent and the velocity acquired at the end of that time.

Again: let it be supposed that a body may be projected vertically upwards in vacuo from the surface of the earth, and be subject to a variably accelerative force of attraction downwards. Let r be the semidiameter of the earth as before; and now let x be the height ascended from the surface at the end of the time t: also let h be the height due to the initial velocity, supposing the latter to have been acquired by a body falling in vacuo with a uniformly accelerative force; then $2gh$ will express the square of that velocity. By the law of attraction we have $\frac{1}{r^2} : g :: \frac{1}{(r+x)^2} : \frac{gr^2}{(r+x)^2}$; and the last term expresses the intensity of the attractive force at the end of the time t from the commencement of the ascent. Hence $\frac{d^2x}{dt^2} = \frac{gr^2}{(r+x)^2}$.

In order to integrate this equation, multiply both sides by $2dx$; then we get $\frac{dx^2}{dt^2} = -\frac{2gr^2}{r+x} + const.$: and to find the constant, it must be observed that $x=0$ when $\frac{dx^2}{dt^2} = 2gh$; therefore $const. = 2g\,(h+r)$ and $\frac{dx^2}{dt^2} = 2g\,(h+r) - \frac{2gr^2}{r+x}$, or $= \frac{2g\{hr+(h+r)x\}}{r+x}$. Taking the square roots and transposing, we have $\frac{\sqrt{r+x}}{\sqrt{\{hr+(h+r)x\}}}dx = \sqrt{2g}\,.\,dt$, and this equation may be put in the form

$$\frac{(r+x)dx}{\sqrt{\{hr^2+(2h+r)rx+(h+r)x^2\}}} = \sqrt{2g}\,.\,dt;$$

or (h being small compared with r) rejecting h when added to r, the equation becomes

$$\frac{(r+x)dx}{\sqrt{\{hr^2+r^2x+rx^2\}}} = \sqrt{2g}\,.\,dt.$$

Now, multiplying the numerator and denominator of the first member by $2r$, and putting the whole in the form

$$\frac{(r^2+2rx)dx}{2r\sqrt{\{hr^2+r^2x+rx^2\}}} + \frac{r\,dx}{2\sqrt{\{hr^2+r^2x+rx^2\}}} = \sqrt{2g}\,.\,dt,$$

the rules of integration give

$$\frac{1}{r}\sqrt{\{hr^2+r^2x+rx^2\}} + \frac{\sqrt{r}}{2}\text{ hyp. log. }\left\{\frac{r^{\frac{3}{2}}}{2} + x\sqrt{r} + \sqrt{\{hr^2+r^2x+rx^2\}}\right\} + const. = \sqrt{2g}\,.\,t.$$

The constant may be determined by considering that $x = 0$ when $t = 0$; and thus t may be found when x is given.

What has been stated respecting the vertical descent and ascent of bodies may be understood to apply also to bodies descending and ascending on inclined planes; the force of gravity on the plane being represented by g sin. a, where a is the inclination of the plane to the horizon.

In Dr. Hutton's Tracts there is given a problem for determining the height ascended by a ball when projected vertically upwards with a given velocity, and resisted by the the air; the force of gravity being supposed to be constant, and allowance being made for the decrease in the density of the air as the ball ascends. (*Tract* 37, prob. v.) In the same tract there is also given (prob. xi.) an investigation of the circumstances attending the motion of a body in air when projected horizontally on a smooth surface so that the action of gravity may produce no effect on the motion of the body, the resistance varying as the square of the velocity. Also in Poisson's 'Traité de Mécanique,' the following remarkable circumstance is demonstrated:—If a body be projected, as in the last case, and if the resistance of the air vary as the square root of the velocity; the motion of the body will at first diminish gradually till it becomes equal to zero; and afterwards it will go on increasing indefinitely. (Tom. i., no. 136, ed. 1833.) But for the demonstrations of these problems our limits oblige us to refer the reader to the works just mentioned.

PROJECTION. The practical parts of this most important application of geometry are noticed in the articles Map, Perspective, Gnomonic, Globular, Orthographic, Stereographic, Mercator, &c. The present article is merely intended to point out the general principle of all projections, and also to note the theoretical importance of the subject.

Imagine a surface of any kind, through every point of which passes a curve the character of which depends upon that point, insomuch that, given a point of the surface, the curve which passes through that point is given. If any second surface be taken, which is cut by all the curves emanating from the points of the first, every point of the first surface has a point corresponding to it on the second. Thus if the curve passing through A on the first surface cut the second surface in a, the point A is said to be projected on the second surface at a by means of the projecting curve Aa. Similarly any line on the first surface is projected into a line on the second, which last contains the projections of all the points on the first; and the projections of the several boundaries of a figure on the first surface are boundaries of a figure on the second, which is the projection* of the first figure.

It is not perhaps usual to make so wide a definition of projection in general, since the only cases which are commonly considered are those in which the projecting lines are all straight, and either parallel to one another, as in the orthographic projection, or all passing through the same point, as in common perspective. But such a conception of projection is necessary: in Mercator's projection, for example, the points of a sphere are projected on a circumscribing cylinder, not by straight lines passing through a point, but either by straight lines disposed according to a complicated law, or by curves. If a relation between any point and its projection be given, so that either can be found from the other, the passage from one to the other may be made either on a straight line or on an infinite variety of curves: but it may happen that the law which the disposition of the projecting straight lines follows may be of a more difficult character than that which would be required if a curve, not in itself so simple as a straight line, were substituted.

When the foundations of plane geometry were fixed, and the first principles of solid geometry were superadded, it was natural that the very simple idea of the perspective projection should excite attention. In a country in which the first principles at least of drawing were practically known, the following problem must have suggested itself to the geometers: If through a given point lines be drawn through all the points of the boundary of a plane figure, until they are stopped by another plane, required the figure traced out upon the second plane. A straight line was known thus to give a straight line: a moment's consideration of the circle, the only other line then considered, would show that a projection of a circle and a plane section of a cone are the same things. Hence probably the first idea of a conic section; and thus, if the conjecture be correct, the attention was turned from that point, which would, if properly kept in view, have led to the theory of projections in place of one isolated branch of it. The properties of the conic sections, as deduced in the antient manner from the cone, are neither so general nor so easy as they might be made; and it may be confidently expected, considering the progress which the doctrine of projections has made of late years, that the method of considering the ellipse, hyperbola, and parabola as projections of the circle, will become established in elementary teaching, in preference to the detached geometrical and algebraical methods now in use.

We have already spoken of the geometry of projections [Geometry, p. 156]: unfortunately there is no elementary work which gives a general view of its first principles; and until such a work shall appear, the student must search for himself the writings of Monge, Carnôt, Chasles, Poncelet, &c. The 'History of Geometry,' by M. Chasles, referred to in the article cited, will furnish many more references; and the 'Propriétés Projectives des Figures,' by M. Poncelet, is perhaps the work in which the student may most easily make an advantageous beginning of the subject.

The basis of the theory of projections must be the investigation of properties which, being true of a figure, are therefore true of its projections. Some of these are evident enough: thus the projection of an intersection of two lines is the intersection of its projections; if two curves touch one another, their projections touch at a point which is the projection of the point of contact. But the following property, which is projective, that is, true of the projections of every figure of which it is true in the first instance, will give a good idea of the facility with which certain properties of the conic sections may be deduced from the circle.

* The projection of a line or figure has seldom any other name; in astronomy however the projection of a planet's distance from the sun on the plane of the ecliptic is sometimes called the *curtate* distance.

Let there be any figure in which the product of certain straight lines is equal to, or in any absolutely given ratio to, the product of certain others, each line being denoted by an initial and terminal letter in the usual way. We might say, in more geometrical language, let there be any number of ratios which, compounded together, give either a ratio of equality or a given ratio. Two simple conditions being fulfilled, this property will be as true of the projections as it is of the figure itself. These conditions are, first, that every initial and terminal letter shall occur the same number of times on both sides of the equation; secondly, that for every line on the first side, there shall be a distinct line on the other side, which is in the same straight line. For example (the reader may draw the diagram for himself), let each of the sides of the triangle ABC cut one circle, namely, AB in P and Q, BC in R and S, CA in T and V; the order of the points being APQBRSCTVA. Then by the properties of the circle, it is easily seen that

$$AV.\,AT.\,CS.\,CR.\,BQ.\,BP = AP.\,AQ.\,BR.\,BS.\,CT.\,CV.$$

In this equation, A, B, and C occur twice on each side, and each of P, Q, R, S, T, V once. Moreover, out of AB there are two segments, AP and AQ, on the first side, and as many, BQ and BP, on the second; and the same of BC and CA. He then, who is acquainted with the theory of projections, immediately knows that this property is true of any projection of a circle, or of any conic section: but he would be an energetic algebraist who should attempt to prove this (or still more the equally demonstrable similar property in the case of a polygon of n sides) by the common algebraic methods.

The proof of the preceding general *projective* property is not difficult. Take a point O outside the plane for the centre of projection, and let $OA = a$, $OB = b$, &c.; moreover let the angle made by a and b be called (ab). Let A′, B′, &c. be the projections of A, B, &c., let $OA' = a'$, $OB' = b'$, &c., and let $(a'b')$ be the angle of a' and b', which is $= (ab)$. Moreover let [AB] mean the perpendicular let fall upon AB from O, &c. It is then easily proved that

$$AV = \frac{a.v.\sin(av)}{[AV]},\quad AT = \frac{a.t.\sin(at)}{[AT]},\ \&c.$$

Substitute these values in the equation, and it will be readily seen that the existence of the two conditions above named amounts to all the quantities except the sines of the angles being eliminable by division. There remains then

$$\sin(av).\,\sin(at).\,\&c. \;=\; \sin(ap).\,\sin(aq).\,\&c.$$
$$\text{or}\ \sin(a'v').\,\sin(a't').\,\&c. \;=\; \sin(a'p').\,\sin(a'q').\,\&c.$$

In these write a', b', [A′V′], &c. where there were previously a, b, [AV], &c., which will amount (by the conditions) to multiplying both sides by the same quantities: there will then remain an equation which is obviously

$$A'V'.\,A'T'.\,\&c. = A'P'.\,A'Q'.\,\&c.,$$

and in the same way any other case may be proved.

PROJECTION OF MATHEMATICAL DIAGRAMS. The diagrams by which mathematical students (and even writers) represent their solid figures are generally so imperfect, that it may be worth while to explain how, in all cases of sufficient importance, a good drawing may be made with very little trouble. The demonstration may be found in the 'Cambridge Mathematical Journal,' No. 8, p. 92. The projection is supposed to be the ORTHOGRAPHIC, in which the eye is at an infinite distance, and all parallels are projected into parallels, &c.

Let OX, OY, OZ, be the intended projection of the three axes of coordinates, the dark lines being supposed to belong to that quarter of space in which lies a line drawn to the eye from the origin O. Each of the angles YOZ, ZOX, XOY, is then greater than a right angle. The following table contains numbers sufficiently near for the purpose, proportional to the square roots of the sines of twice the angles written in the opposite columns.

90—180	000	105—165	707	120—150	931
——	132	——	719	——	935

——	509	——	841	——	983
98—172	525	113—157	848	128—142	985
——	541	——	855	——	987
99—171	556	114—156	862	129—141	989
——	571	——	869	——	991
100—170	585	115—155	875	130—140	992
——	599	——	882	——	994
101—169	612	116—154	888	131—139	995
——	625	——	894	——	996
102—168	638	117—153	900	132—138	997
——	650	——	905	——	998
103—167	662	118—152	911	133—137	999
——	674	——	916	——	999
104—166	685	119—151	921	134—136	1000
——	696	——	926	——	1000
				135—135	1000

The lines between the degrees are to be understood as representing half degrees: thus opposite to 991 should come 129½°—140½°. The use of this table is as follows:—suppose the angles YOZ, ZOX, XOY, to be severally 123°, 104½°, and 132½°: thus:—

YOZ = 123°	956	x
ZOX = 104½°	696	y
XOY = 132½°	998	z

Opposite to the angles put down the numbers belonging to them in the table, and opposite to each number the coordinate whose capital letter does not appear in the angle. Then opposite to x, y, and z, we have 956, 696, and 998. These numbers show the proportions which the projections of equal lines bear to one another on the three axes. Thus a foot parallel to x is to a foot parallel to y, as 956 to 696 in the projection. If then a card be taken, and the angle ZOX be cut out; and if a slit be made in the direction of OY, just wide enough to permit a pencil to travel, scales of equal parts may be laid down on OX, OY, and OZ, which shall represent the projections of equal lines in the three directions; and this may be done once for all. It would be easy enough to make a general scale by which the equal parts proper for any angle should be taken out at once.

The isometrical perspective of Professor Farish [PERSPECTIVE, p. 492] is the simplest case of this, namely, that in which the angles are each 120°. The only difference between this particular case and any other is, that the former requires only one scale of equal parts, whereas the latter requires either two or three. In other respects this method of using them is precisely the same.

PROJECTION OF THE SPHERE, SHADOWS, &c. [PERSPECTIVE.]

PROKOPHIEV, IVAN PROKOPHIEVITCH, an eminent Russian artist, was born at St. Petersburg, January 25, 1759. At the age of twelve he began to study sculpture under Gilet, one of the professors at the Academy of Fine Arts, and during the eight following years obtained medals and prizes for various bas-reliefs, to which branch of the art he afterwards more especially applied himself. Having gone through the course of studies at the academy, he was sent, at its expense, in September, 1779, to perfect himself under Julien, at Paris, where, in the following year, he executed a bust in marble of Prince Gagarin, and a relief in terra-cotta representing Moses, which last, and a similar one of Morpheus, are in the Academy at St. Petersburg. Having passed a few months at Berlin and Stettin, on his way home, he returned to Petersburg in the summer of 1784; and from that time till within a few years preceding his death, he continued to practise his art most industriously. His productions are so numerous that even a mere list of them would extend to a considerable length; but the majority of them were certainly not of the kind to excite much public attention, as they consisted chiefly of bas-reliefs, medallions, and works of that class, on a comparatively small scale, and executed for private individuals. Many of them besides were only in terra-cotta. Taken generally however they are allowed to display considerable powers of invention and ability in composition. In the Imperial Library at Petersburg there are sixteen small caryatides and twenty-eight bas-reliefs by him. His last work was a bust of the Polish poet Trembecki; soon after the completion of it he was attacked by a complaint that deprived him of the use of his right hand, at least rendered him incapable of employing it either in modelling or designing. He died at St. Petersburg, February 10, 1828, in his 71st year.

The earlier productions of this artist have, with much beauty, somewhat also of the French mannerism of that day in sculpture, caught, no doubt, from his instructor Julien; but he afterwards completely corrected that fault, and his later works display a more noble and classical style.

PROLOCU'TOR. [CONVOCATION.]

PROLOGUE (πρόλογος, from πρὸ, *before*, and λόγος, *speech*) is usually applied in English to the short poem or verses which are sometimes prefixed to new plays to recommend them to the favour of the reader or spectators. In the comedies of Plautus and Terence we find prologues of this kind. Aristotle (*De Poetic.*, c. 12) gives the name of prologue to that part of the Greek tragedy which precedes the Parodos, or first speech of the chorus.

PROMERO'PIDÆ, PRO'MEROPS. [UPUPIDÆ.]

PROME'THEUS (Προμηθεύς). The story of Prometheus takes different forms in the Greek legends, but they agree generally in representing the close connection between him and the human race. He is represented by Æschylus as one of the Titans, who incurred the resentment of Zeus for taking the part of mortals when Zeus intended to crush them and to send them to the abode of Hades, and also for giving them fire and teaching them all the arts. As a punishment, Zeus binds him to a rock in Scythia, and appoints a vulture to prey on his liver. This is the subject of the 'Prometheus Desmotes,' or 'Prometheus Bound,' of Æschylus.

Another old form of the legend, which closely resembles that which Æschylus followed, is given in the 'Theogony' of Hesiod. Hesiod says that when the gods and men were engaged in a controversy with one another at Mecone (an antient name of Sicyon). Prometheus, wishing to deceive Zeus, took an ox, and dividing it, placed the flesh and the viscera in the hide, and the bones of the ox in the inside fat, and then asked Zeus to make his choice. Zeus, though aware of the deception, chose the bones and the fat, 'designing evil in his mind against mortal man,' and in revenge withheld fire from man. Prometheus however secretly stole fire from heaven and gave it to man, and Zeus in return bound Prometheus with chains to a pillar, and sent an eagle to prey upon his liver. Zeus also, in order to injure man, created Pandora, and, after bestowing upon her numerous gifts, sent her to man a 'beautiful mischief, for from her is sprung the race of women, of whom the race is thoroughly destructive.' Hesiod, in his poem entitled 'Works and Days,' gives at greater length the legend of Pandora, and says that Zeus sent her to Epimetheus; and that he, not following the advice of Prometheus, who had told him never to receive a gift from Zeus, but to send it back again, took her into his house. These stories are supposed to have a meaning: Prometheus is the personification of *fore-thought*, and Epimetheus of *after-thought*.

There is another form of the legend respecting Prometheus, in which he is represented not merely as the friend and protector of the human race, but as their creator. This form is an old one, though neither Hesiod nor Æschylus has followed it. There is a fragment of Callimachus, in which he says, 'If Prometheus formed thee, and thou art not sprung from some other clay.' Plato has adopted this form of the legend in the 'Protagoras,' but with the variation that Prometheus is not the creator, but only the person who endowed man with his senses. He says that the gods formed all mortal animals within the earth, out of the mixture of earth and fire, and of as many things as are mingled with earth and fire, and that they entrusted to Prometheus and Epimetheus the business of providing them with all the faculties necessary for their preservation. He then proceeds to say that Epimetheus begged of Prometheus that he might have the business himself in the first place, and that Prometheus should overlook his work when he had done it. Epimetheus accordingly proceeds to his work, and bestows upon the different animals the means of preserving themselves; but when man came to be provided for, who was to be superior to all other animals, Epimetheus had been so prodigal of all his resources, that he had nothing left to bestow upon man. Prometheus, being at a loss how to remedy the omission of Epimetheus, steals from Hephæstus and Athena fire and the intelligence which is displayed in works of art, and gave them to man; so that by means of this wisdom, and fire as its instrument, men were endowed with the power of providing for themselves.

Some modern writers suppose that, in the earliest form of the legend, Prometheus was not considered as a deity, but simply as the representative of the human race, and that afterwards he was made a god, the friend and protector of man, and at last their creator.

PROMISSORY NOTES. [BILL OF EXCHANGE.]

PROMO'TUS, ÆLIUS (Αἴλιος Πρόμωτος), an Alexandrian physician, whose date is not exactly known. Villoison (*Anecd. Gr.*, tom. ii., p. 179, not. 1) says that he lived after the time of Pompey the Great, but Passevin (*Bibl. Select.*, p. 17), and Ant. Bongiovanni, in his letter to Giov. della Bona (Io. à Bona, *Tract. de Scorbuto*, Veronæ, 1781, 4to.), consider him to be much more antient. He is probably the person mentioned by Galen (*De Compos. Medicam. sec. Loca*, lib. iv., cap. 6); and he is the author of several Greek medical works, which are still in MS. in different European libraries. The prologue to one of these, entitled δυναμερὸν, i.e. *Congeries Medicaminum secundum Loca*, together with some extracts from it, is to be found in Bona's treatise quoted above, and is reprinted by Kühn, in his 'Additam. ad Elench. Medicor. Vet. à Io. A. Fabricio exhibit.,' 4to., Lips., 1826. The extracts consist of recipes for different diseases. The work exists in MS. in St. Mark's Library at Venice, No. ccxcv., 4to. (Morell, *Bibl. Inst.*, *cum Græc. tum Latin.*, i. 170.) Fabricius mentions another of his works, entitled ἰατρικὰ, φυσικὰ, καὶ ἀντιπαθητικά, which exists in MS. at Leyden among the books belonging to Voss. Schneider says (*Præfat. in Nicand. Alexipharm.*, p. 19) that, judging from an extract sent him by Ruhnken, the work is so full of absurdities as not to deserve to be published. Another of his works, entitled περὶ ἰοβόλων καὶ δηλητηρίων φαρμάκων, is to be found in the libraries at Rome and at Paris. Mercuriali has inserted a few fragments in his 'Variæ Lectiones' (lib. iii., cap. 4), and several times quotes it in his work 'De Venenis, et Morbis Venenosis,' lib. i., cap. 16; lib. ii., cap. 2), from which it appears (lib iii., cap. 4) that he agreed with Ælian (*De Nat. Anim.*, lib. vi., cap. 20), Apollodorus (ap. Plin., *Hist. Nat.*, lib. xi., cap. 30), and Nicander (*Ther.*, v. 769, &c.), in dividing scorpions into nine species. Kühn tells us (*loco cit.*) that Weigel also meditated an edition of the δυναμερὸν.

PRONOUNS, the name given by grammarians to certain words which are used as substitutes for the names of persons and things. Pronouns properly so called are commonly divided into personal, demonstrative, relative, and interrogative pronouns; but it appears probable that all pronouns, at least with the exception of the first and second personal pronouns, were originally demonstrative. William Humboldt remarks that the first and second personal pronouns 'are not mere substitutes for the names of the persons for whom they stand, but involve the personality of the speaker and of the person spoken to, and the relation between them;' and in writing and conversation there is frequently hardly any name which can so clearly designate the person intended as the appropriate personal pronoun. The third personal pronoun in English appears to have been originally a demonstrative, and to contain the same root, *ta*, *sa*, or *ha*, which occurs in the demonstrative pronoun in the Latin, Greek, and other cognate languages. The different forms of the demonstrative pronoun in these languages is explained under ARTICLE, and its declension, as well as that of the first and second personal pronouns, is given under LANGUAGE, p. 310.

The relative pronoun may also be regarded as a demonstrative; for whether the pronoun is used to denote an object pointed out at the time by the speaker, or an object mentioned just before, or one which is to be immediately brought before the hearer's mind, it is equally demonstrative. In the last of these cases the pronoun is called a relative, as 'I saw the man *whom* you mentioned.' In English we have two forms for the relative, *that* and *who* or *which*. The former is the same word as the demonstrative; the latter contains the same root as we find in the Latin *qui*, the Sanscrit, Zend, and Lithuanian *ka*, and the Gothic *hwas* and *hwo*. The interrogative pronoun is the same as the relative in English and many of the cognate languages, and only differs from the relative in referring to something subsequent and unknown, whereas the latter refers to an antecedent and definite subject.

PRONUNCIATION. [ORATORY.]

PRONY, GASPARD CLAIR FRANÇOIS MARIE RICHE DE, was born at Chamelet, in the department of the Rhone, July 22, 1755. His father was a member of the 'parlement,' or chief civil court, of the ancient principality of Dombes; and at the College of Thoissey in that principality Prony received his education 'till 1776, when he entered the Ecole des Ponts et Chaussées.' Here his assiduity was such as to lead Perronnet to foretell that he would one day occupy his own position, that of head of the establishment. He first became known as an author by an Essay on the 'Thrust of Arches,' published in 1783, about which time he began to be employed, under Perronnet, upon several public works, among which may be mentioned the restoration of the port of Dunkirk (1783), and the erection of the bridge of Louis XVI. (1787-90), of which last the engineering plan is said to have been drawn up and its execution superintended by Prony.

In 1790, he published the first volume of his 'Hydraulic Architecture.' The second appeared in 1796. Prior to this, the only work of the kind accessible to the engineer was the standard work bearing the same title, by Belidor, published in 1737-53, so that, as Delambre observes, the progress which the theory of mechanics had made in the hands of Euler, D'Alembert, Lagrange, and Laplace, had lain without real application to the arts of construction. Prony's work is perhaps the first of an elementary character in which the directions of forces, and the systems on which they act, are referred to rectangular co-ordinate axes. It contains a clear exposition of the steam-engine, at a time when the steam-engine was scarcely known on that side of the Channel; but his empirical formulæ for determining the elasticity of steam, the investigation of which occupies a considerable portion of the second volume, have been entirely superseded by more recent researches. His method of determining the diameter of a steam-cylinder Tredgold designates as 'little better than telling the artist to guess at it, and correct his guess by an intricate formula.' The same author remarks that the labours of Prony in this department 'afford the strongest evidence that mere mathematical talent is not sufficient for the promotion of mechanical science, otherwise the principle of the steam-engine would not have remained to be investigated.'—(Tredgold *On the Steam-Engine*, Lond., 1838, 4to., i., p. 32.)

Among other scientific projects of the French revolutionary government at this period, was that, suggested by Carnot and others, of computing a set of mathematical tables, by which it was supposed two objects would be attained,—the application of the decimal division of moneys, weights, and measures, then recently introduced, would be facilitated; and the world astonished by the 'most vast and imposing monument of calculation which had ever been executed or even conceived.' The direction of this laborious undertaking was confided to Prony in 1792 (year ii.), and with him were associated three or four of the principal mathematicians of Paris, including Legendre. It was however easy to foresee that their joint efforts, and the exclusive devotion of the rest of their lives, would alone be inadequate to the completion of the task they had undertaken. Occupied with this discouraging reflection, Prony opened by accident a volume of Adam Smith's 'Wealth of Nations,' at a part where the author is instancing the manufacture of needles, in illustration of the principle of the division of labour. 'Why,' thought Prony, 'should not the same principle be applicable, and with equal advantage, in the manufacture of logarithms?' Pondering on the practicability of this, he retired into the country, and in a few days returned with his plan of operations fully digested. He divided his assistants into three sections; the first, of which Legendre was the president, was occupied in selecting from 'amongst the various analytical expressions which could be found for the same function, that which was most readily adapted to simple numerical calculation, by many individuals employed at the same time.' (Babbage, *Economy of Manufactures*, p. 191.) These expressions included several very elegant formulæ investigated by Legendre, for determining directly the successive differences of the sines. The second section 'consisted of seven or eight persons of considerable acquaintance with mathematics; and their duty was to convert into numbers the formulæ put into their hands by the first section, an operation of great labour; and then to deliver out these formulæ to the members of the third section, and receive from them the finished calculations. . . . The third section, which consisted of from sixty to eighty members, received certain numbers from the second section, and using nothing more than simple addition and subtraction, they returned to that section the tables in a finished state.' (Babbage, pp. 191-2.) The whole of the calculations, which, to secure greater accuracy, were performed in duplicate, and the two MSS. subsequently collated with care, were completed in the short space of two years. They occupy seventeen 'enormous' folios, and consist of—1, An introduction, containing the analytical formulæ and the mode of using the tables; 2, 10,000 natural sines to 25 places of decimals, with seven and eight columns of differences; 3, The logarithms of 100,000 sines to 14 places of decimals and 5 columns of differences; 4, The logarithms of the ratios of the first 5000 sines to their corresponding arcs to 14 decimal places; 5, A similar table of the ratios of the tangents to their arcs; 6, The logarithms of 100,000 tangents; 7, The logarithms of numbers from 1 to 100,000 to 19 decimal places, and from 100 to 200,000 to 14 decimal places, with 5 columns of differences. In 1820 a distinguished member of the Board of Longitude, London, was instructed by our government to propose to the Board of Longitude of Paris, to print an abridgment of these tables at the joint expense of the two countries: 5000*l* was named as the sum which our government was willing to advance for this purpose, but the proposal was declined, and the great 'Tables du Cadastre' are still confined, in manuscript, to the library of the Paris Observatory.

Prony was appointed professor of mechanics to the Ecole Polytechnique in 1794, the year of its institution, and the same year he became directeur-général des Ponts et Chaussées. As professor to the Ecole Polytechnique he was indefatigable in endeavouring to bring the researches of modern mathematicians within the comprehension of his pupils. This was the object of his 'Mécanique Philosophique,' Par., 1800, 4to. It is an analytical synopsis of mechanics, hydrostatics, and hydraulics. The right-hand pages are each divided into four columns, headed notation, definition, theorems, problems; while those to the left are occupied with so much of investigation and reasoning as is just sufficient to connect the several results in the mind of the student.

In 1798 Napoleon invited him to become a member of the Institute of Egypt, which however he declined, and his refusal was never entirely forgotten or pardoned. Nevertheless, after Napoleon's coronation as king of Italy (1805), Prony was charged with the engineering operations for protecting the province of Ferrara from the further inundations of the Po; and about the same time, or earlier, he was employed in superintending the works then carried on by the French government in the ports of Genoa, Ancona, Pola, and in the Gulf of Spezzia, including some very intricate investigations connected with the tides, currents, and deposits of the Adriatic and canals within the Venetian territory. Napoleon's animosity towards Prony appears to have been counteracted only by a regard for his abilities. We are told by Arago that Prony's researches relative to the thrust of embankments ('poussée des terres'), and on the proper dimensions of lining-walls ('murs de revêtement') Paris, 1802, 4to., with the obvious practical utility of the results to which they led, were the means of securing Napoleon's suffrage. On a later occasion, when the emperor was distributing the new dignities which he had created, a secretary of state reminded him of Prony, to which he merely replied, 'Il ne faut pas mettre son rabot en dentelles; on ne pourrait plus s'en servir pour raboter.'

In 1810 he was appointed (in conjunction with Count Fossombroni of Florence) chief of the Commissione de l'Agro Romano, which had for its object the more effectual drainage and improvement of the Pontine Marshes. 'The results of his labours in this very important task, which he prosecuted with extraordinary zeal and success, were embodied in his "Description Historique et Hydrographique des

Marais Pontins," which appeared in 1823, and which contains a very detailed account of the past, present, and prospective condition of those pestilential regions, and a very elaborate and scientific description of the principles which should guide us in all similar cases in order to effect their permanent restoration to healthiness and fertility.' [POMPTINE MARSHES.] (*Edinburgh Journal of Science*, xv., p. 527.)

After the Restoration he continued to be employed in various important works, among which was the formation of extensive embankments near the mouth of the Rhone. In 1817 he became a member of the Bureau de Longitude: the following year he was elected one of the fifty foreign members of the Royal Society, London: in 1828 he was created a baron by Charles X.; and in 1835 a peer of France. He died at Aonières, near Paris, the latter end of July, 1839.

In his professional character Prony was the reverse of imperious. He gave his opinion on all occasions with exemplary frankness. Those who were associated with him in any of his undertakings continued ever after his friends, and there is no instance of a pupil claiming his support without its being cordially granted. That he was mindful of his obligations to others is shown by his calling on Arago in 1837, and desiring him not to omit in his 'Eloge of Carnot,' then about to be published for the first time, that the latter had saved his (Prony's) life in 1793. As a mathematician and philosopher, though inferior to some of the great men of his day, he was certainly one 'of whom his country may justly be proud, whether we consider the extent and character of his scientific attainments, or the variety of important, practical, and useful labours in which his life was spent.'

The following works, with those already mentioned, will, we believe, nearly complete the list of Prony's literary labours:—1, 'Experimental and Analytical Essay on the Laws of Expansion observed by Elastic Fluids, and on the Expansive Force of the Vapours of Water and Alcohol at different Temperatures,' Par., 1794, 4to. (also printed in the first volume of the 'Journal de l'Ecole Polytechnique'); 2, 'Plan of Instruction for the Students of the National School des Ponts et Chaussées, for the year vii.,' Par. 1795; 3, Analysis of the 'Exposition du Système du Monde' of Laplace, Par. 1801, 8vo.; 4, 'Plan of Instruction for the Polytechnic School so far as regards the Equilibrium of Bodies,' Par. 1801, 4to.; 5, 'Report made to the Mathematical and Physical Class of the National Institute, upon divers inventions of Jean Pierre Droz, relative to the Art of Coining,' Par. 1801, 4to.; 6, 'Report on the Memoir of Ducros relative to the supply of Water requisite for Canals,' Par. 1801, 8vo.; 7, 'Results of Experiments for determining the Relation between the French Mètre and the English Foot,' Paris, 1802; 8, 'On the supply of Water requisite for the Canal Saint Quentin' ('Sur le Jaugeage des Eaux Courantes qui doivent alimenter le bassin du passage du Canal Saint Quentin'), Par. 1802, 4to.; 9, 'Physico-Mathematical Researches in the Theory of Flowing Waters,' Par. 1804, 4to.; 10, 'On the Computation of Latitudes and Longitudes,' Par. 1806, 4to.; 11, 'On the Variations in the Inclination of the Seine, and its Amount for each day of the years 1788-89-90, together with the Report made to the Academy of Sciences, January 29, 1791, by Lavoisier, Laplace, and Coulomb,' Par. 1806, 4to.; 12, 'Summary of Lessons on the Motion of Solids and on the Equilibrium and Motion of Fluids,' Par. 1809, 4to.; 13, 'Lessons in Analytical Mechanics delivered to the Royal Polytechnic School,' Par. 1815, 4to.; 14, 'On Bréguet's Metallic Thermometers,' Par. 1821, 4to.; 15, 'On the work of M. Sept-Fontaines relative to the Cubature of Timber,' 4to., no date; 16, 'On Swing-Bridges' ('Ponts à Bascules'), 4to., no date; 17, 'New System of Trigonometrical Levelling,' Par. 1822, 8vo.; 18, 'On the large Logarithmic and Trigonometrical Tables adapted to the new Decimal System of Weights and Measures,' Par. 1824, 4to.; 19, 'On the recently instituted Professorship of the Harp in the Royal School of Music,' Par. 1825, 4to., 12 pages; 20, 'Synopsis (Résumé) of the Theory and Formulæ relative to the Motion of Water in Tubes and Canals,' Par. 1825; 21, 'Report on the Old and New Steam-Engines erected at Paris, au Gros Caillou,' Par. 1826, 8vo.; 22, 'Fragments of an unedited Memoir,' Lyon, 1827, 8vo. (16 pages); 23, 'Elementary Instructions on the Calculation of Musical Intervals by assuming either the Octave or the Twelfth Octave as the Unit of Comparison;' 'Analytical Formulæ for calculating the Acoustic Logarithm of any proposed Number, &c., with applications to Musical Instruments,' Par. 1832, 4to.; 24, 'Examination of the proposals for levying a Toll ('Projets de Barrage') on the Seine near Hâvre,' Par. 1831, 8vo. (also in the 'Annales des Ponts et Chaussées'); 25, 'On the Inflexions which, after the lapse of twenty years, had taken place in certain straight lines drawn upon the bridge Louis XVI., prior to the removal of the centering, with Formulæ and Tables for calculating the change which settlement ('le tassement') produces in a circular arch,' Par. 1832, 20 pages; 26, 'Formules pour calculer les Hauteurs des Remons occasionés, soit par des Rétrécissements, soit par des Barrages (avec écoulements de fond) pratiqués dans les Lits des Eaux Courantes,' Par. 1835, 8vo. (also in the 'Annales des P. et C.'); 27, 'On the Measurement of the Dynamical Effects of Rotatory Machines,' Par., 4to., no date; 28, 'On Regulating the Duration of the Oscillations of the Pendulum,' Par., 4to., no date.

To the *Recueils de l'Institut* he contributed—1, 'Notice of the Life and Works of Pingré,' tom. i, 1798; 2, 'On the Conversion of Circular Movement into Rectilinear,' ii., 1799. To the *Journal de l'Ecole Polytechnique*—1, 'On a Course of Elementary Analysis, by Lagrange,' tom. i., 1794; 2, 'Course of Mechanics for the Year V.,' ii., 1795; 3, 'Eloge de Lamblardie,' ib.; 4, 'On the Principle of Virtual Velocities and the Decomposition of Circular Motions,' ib.; 5, 'Introduction to Pure Analysis and of Analysis as applied to Mechanics,' ib.; 6, 'Theory of Rotation about a Free Axis,' ib.; 7, 'On the Particular Solutions of Differential Equations and their Application to Engineering,' iv., 1810; 8, 'On the Hydraulic System of Italy,' ib.; 9, 'Detailed Analysis of the Questions relative to the Motion of a Body acted upon by any Powers whatever,' ib.; 10, 'On the New Sluice of M. de Baucourt,' viii., 1809. See also the *Bulletin de la Société Philomathique*; *Annales des Mines*; *Encyclopédie Méthodique* ('Forêts et Bois'); *Connaissance des Temps*, after 1800.

('Discours prononcé par M. Arago, le 3 Août, 1839, sur la tombe de M. de Prony,' given in the *Annuaire* for 1840; *Biographie des Contemporains*; *Edinburgh Journal of Science*, vol. xv.; 'Note sur la Publication proposée par le Gouvernment Anglais, des grands Tables Logarithmiques and Trigonometriques, de M. de Prony,' Paris, 1820, quoted by Babbage in his *Economy of Machinery and Manufactures*, London, 1832; *Parliamentary Papers*, 1823, xv., p. 9, &c.; Querard's *Dictionnaire Bibliographique*; *The Works of Prony*, &c.)

PROOF. [DEMONSTRATION; EVIDENCE; MIRACLE; OATH; PROBABILITY.]

PROPE'RTIUS, SE'XTUS AURE'LIUS, a native of Hispellum, or, according to others, of Mevania in Umbria. The year of his birth is not stated by any antient authority, but he himself (iv. 1, 127, &c.) says that he took the toga libera (which was generally taken at the age of fifteen) at the festival of the Liberalia, soon after the battle of Philippi, which was fought in 42 B.C., so that he must have been born about the year 56 B.C. His family was of equestrian rank (iv. 1, comp. with Plin., *Epist.*, vi. 15, and ix. 22), and when, after the campaign of Philippi, Augustus rewarded his veterans with assignments of lands, the family of Propertius was, like many others who had supported the cause of Antony, deprived of their estates. About this time or soon afterwards, young Propertius went to Rome, where he devoted himself entirely to poetry (iv. 1, 134). In Rome he soon attracted the attention and gained the friendship of contemporary poets, such as Ovid, who always speaks of him with fondness (*Trist.*, ii. 465; iv. 10, 53; v. 1, 17; *Ars Amat.*, iii. 334; and in other places). He also enjoyed the patronage of Mæcenas, and lived on the Esquiline, perhaps in the gardens of his patron himself. His property seems to have been very small, for no estate or villa of his is mentioned. Mæcenas tried to induce him to write an epic poem, in which he was to celebrate the achievements of Augustus (ii. 1), but Propertius refused to comply with the wish of his patron, at least partly; and seems purposely to have described himself as a man given to sensual enjoyments, in order that no such lofty claims might be made upon him. The fourth book of his 'Elegies' however contains a series of poems on Roman legends, especially those of a religious nature. Now, as Augustus restored many old religious forms, it does not seem improbable that the poet here at least partially intended to fulfil the wish of Mæcenas. It has been supposed that Propertius died at a very early

Age, but Goble (*Observationes in Propertii Carmina*, 1833) has shown that the first book of his 'Elegies' was not written before the year 28 B.C.; the second not before 24 B.C.; the third not before 21 B.C.; and the fourth not before 16 B.C.; and according to these dates he must at least have lived until the year 16 B.C., to the age of forty. An accurate Life of Propertius is still a desideratum in the history of Roman literature. His connections of friendship, to which allusions are made in his poems, as well as those of his contemporaries, might furnish some materials towards it.

Propertius, in his poetry, took Callimachus and Philetas as his models, and his ambition was to be considered the Roman Callimachus, to which a sneering allusion is made by Horace (*Epist.* ii. 2, 100). We possess four books of Elegies of Propertius; whether he wrote more is uncertain. In the first three books he sings of his beloved Cynthia, whose real name is said to have been Hostia; the fourth, which by some editors has been subdivided into two, is chiefly occupied with heroic and religious legends, in which the poet seems to have possessed considerable learning; and he delights in showing it, though he thereby weakens the effect of his poetry. The Elegies addressed to Cynthia, who herself was a woman of eminent talents, form a kind of romance, and, considering the character of the age, evince an almost unparalleled faithfulness and constancy between the lovers. But Propertius has nothing of the effeminate sentimentality of Tibullus, and, notwithstanding his passionate love, he always retains his manly character, and shows great energy and independence of mind. The agreeable effect which this kind of poetry might produce is impaired by the artificial character of his style, in which he followed the Greek poets of the Alexandrian period. The ancients however looked upon him as a great poet. (Plin., *Epist.*, ix. 22; Quintil., x. 1.)

Propertius used formerly to be edited together with Catullus and Tibullus, as in the editio princeps, Rome, 1472, and in that of Scaliger, Paris, 1577, reprinted in 1582 and 1600. A separate edition of Propertius appeared in 1702, 4to., at Amsterdam, with a commentary by Broukhusius. The most complete edition is that of P. Burmann, which was published after his death, in 1780, by Santen. For the establishment of a correct text much has been done in the editions of Lachmann (Leipzig, 1816), Paldamus (Halle, 1827), and Jacob (Leipzig, 1827).

Propertius was translated into French prose, in 1655, by De Marolles; and in 1821 appeared the second edition of a translation into French verse, by Mollevaut. Among the numerous German translations it is sufficient to mention that of J. H. Voss (Braunschweig, 1830), and another by Gruppe (Leipzig, 1838), with critical notes on the Roman Elegy. Some of the Elegies of Propertius were translated into English in the 'Miscellaneous Poems by Oxford Hands,' London, 1685; in 1782 was published, in London, 'The Book of the Elegies of Propertius, entitled Cynthia, translated into English verse, with classical notes,' &c.

PROPERTY is derived, probably through the French language, from the Latin word Proprietas, which is used by Gaius (ii. 89) as equivalent to ownership (dominium), and is opposed to *possessio*. [POSSESSION.] The etymology of the word proprietas (proprius) suggests the notion of a thing being a man's own, which general notion is contained in every definition of property. Blackstone (ii. 1) defines 'the right of property' to be 'that sole and despotic dominion which one man claims and exercises over the external things of the world, in total exclusion of the right of any other individual in the universe.' A foreign writer defines ownership or property to be 'the right to deal with a corporeal thing according to a man's pleasure, and to the exclusion of all other persons.'

This definition excludes incorporeal things, which however are considered objects of property in our law, and were also considered as objects of property in the Roman law, under the general name of jura or iura in re; they were considered as detached parts of ownership, and so opposed to dominium, a word which represented the totality of the rights of ownership. (Savigny, *Das Recht des Besitzes*, 5th edit., p. 166.) This definition also describes property as consisting in a right, by which word right is meant 'a *legal* power to operate on a thing, by which it is essentially distinguished from the mere possession of the thing, or the physical power to operate upon it. Consequently such a right is not established by the possession of the thing; and it is not lost, when the possession of the thing is lost. Such a right can also be enforced by him who possesses the right by an actio in rem against every person who possesses the thing, or disputes his right to it.' (Mackeldey, *Lehrbuch des heutigen Röm. Rechts*, ii., p. 136.) This definition, which is characterised by a precision and accuracy which are altogether wanting in that of Blackstone, is here adopted. By property then is here understood only that which the positive law of a country recognises as property, and for the protection or recovery of which it gives a remedy by legal forms against every person who invades the property, or has the possession of it.

Austin observes ('An Outline of a Course of Lectures on General Jurisprudence') that 'dominium, property, or ownership is a name liable to equivocation. For, first, it may import that the right in question is a right of unmeasured duration, as well as indicate the indefinite extent of the purposes to which the entitled person may turn the subject. Secondly, it often signifies property, with the meaning wherein property is distinguished from the right of possession. [POSSESSION.] Thirdly, dominium, as taken with one of its significations, is exactly co-extensive with *jus in rem*, and applies to every right that is not *jus in personam*.' The first sense of the word property is expounded by determining, as hereafter explained, the quantity and quality of an estate as understood in English law. As to the *second*, possession is of itself no right, but a bare *fact*, and its relation to rights in rem is the same as the physical to the legal power to operate on a thing. The doctrine of possession is therefore distinct from and should precede the doctrine of property. [POSSESSION.] The third sense of property has reference to the legal modes of obtaining the possession of a thing in which a man can prove that he has property and a present right to possess.

A complete view of property, as recognised by any given system of law, would embrace the following heads, which it would be necessary to exhaust, in order that the view should be complete. It would embrace an enumeration of all the kinds or classes of things which are objects of property: the exposition of the greatest amount of power over such things as are objects of property, which a man can legally exercise—and connected with this, the different parts or portions into which the totality of the right of property may be divided, or conceived to be divided: the modes in which property is legally transferred from one person to another, that is, acquired and lost: the capacity of particular classes of persons to acquire and transfer property as above understood; or, to take the other view of this division, an enumeration of persons who labour under legal incapacities as to the acquisition and loss of property.

The following general outline of property is adapted to the English system of Law. It may be filled up by references to other articles in this work, or to treatises.

1. The kinds or classes of things which are objects of property.

The general division is into Things Real and Things Personal, the incidents to which are so different in the system of English Law that they must be separately considered.

Things Real are comprehended under the terms of Lands, Tenements, and Hereditaments. The word Hereditaments is the most comprehensive of these terms, because it comprehends every thing which may be an object of inheritance, both Things Real, and also some Personal Things, such as heirlooms, which are objects of inheritance.

Hereditaments are divided into Things Corporeal and Incorporeal. A Corporeal Hereditament is land, in the legal sense of the term. An Incorporeal Hereditament is defined by Blackstone to be 'a right issuing out of a thing corporate (corporeal), whether real or personal, or concerning or annexed to, or exerciseable within the same.' Perhaps the definition is not quite exact, and it would not be easy to make an exact definition. The Things Incorporeal of the English law correspond in their general character to the Res Incorporales of the Roman Law, one distinguishing character of which is that they are incapable of tradition or delivery (Gaius, ii. 28): the Res Corporales of the Roman Law are things which are capable of tradition, whether moveable, as a horse, or immoveable, as a house. The Incorporeal hereditaments enumerated by Blackstone are, Advowsons, Tithes, Commons, Ways, Offices, Dignities, Franchises, Corodies or Pensions, Annuities, and Rents.

2. The greatest amount of power over such things as are objects of property which a man can legally exercise.

To this head belongs the English doctrine of Tenure, or the various ways in which land is said to be *held*. Though this was a much more important part of English law than it now is, it is still of importance; for Tenure always exists wherever there is the relation of landlord and tenant. As all land in the kingdom is held mediately or immediately of the crown, it follows that a man cannot have a Property in land which shall not be subject to this right of the crown. He cannot operate upon his Property in land in any way so as to destroy this right; and consequently the utmost amount of Property in land which a man can have, is limited. The interest which a man can have in any land, tenement, or hereditament, is called an Estate; and this word comprises the greatest amount of power and enjoyment, both as to time and manner, which a man can legally have over and in any of the three things just enumerated, as well as the smallest legal amount of such power and enjoyment: it also comprises, under the notion of time, the determination of the period when his power and enjoyment shall commence, as well as when they shall cease. Lands, tenements, and hereditaments then being objects of Property, a man may either have the most complete property in such things which is legally allowed, or he may have the least property in them which the law allows; and both this complete and this limited Property is expressed by the word Estate. An estate in a thing is Property in a thing, and Property in a thing is legally considered to be capable of division into defineable parts, called Estates, each of which estates has its defineable legal incidents. With reference to an estate the time during which the right of enjoyment continues is usually expressed by the term Quantity of Estate. The manner in which the enjoyment is to be exercised during this time is often expressed by the term Quality of Estate: thus a man may enjoy an estate solely or in joint-tenancy; his enjoyment may be co-extensive with the largest amount of legal enjoyment of any estate, or it may be limited by the contemporaneous Rights of others in or to the Property in which he has an Estate, that is, he may have the legal enjoyment for a determinate time, subject to various limitations and abridgments of the fullest enjoyment of Property. The time when the enjoyment of the Estate shall commence is also considered a part of its Quality; and the time of enjoyment commencing is either present, that is, contemporaneous with the acquisition of the estate, or future. It may not be useless to remark that here and elsewhere, where the word Estate is used in its technical sense, it does not mean the thing enjoyed, but the quantity and quality of enjoyment of the thing.

Independent of the quality and quantity of an estate, there is another modification of property which requires notice. A person may have the estate both as to quantity and quality in the sense above explained, either with or without the right to the beneficial enjoyment. The person who has merely the Estate in quantity and quality, has the bare legal Estate. He who has not the right to the Estate in quantity and quality, as above explained, but merely to the enjoyment of such estate, while the other has not, is said to have the equitable estate. The term quality of estate might be used to express this equitable interest; but inasmuch as we want a word to express the manner and mode of enjoying an estate as distinct from the time of enjoyment, and as quality is the word used to express that manner and mode, it must not be used in a different sense. The explanation of the nature of an equitable as distinguished from a legal estate belongs to Uses and Trusts.

It has been said that this distinction between legal and beneficial or equitable property is peculiar to the English law. (Lord Mansfield, 1 *T. R.*, 759, n.) But these two kinds of property existed in the Roman law, and the theory of the division of ownership or property into Quiritarian or legal, and bonitarian, beneficial, or equitable, was fully developed. Its origin in the Roman law is not certain; but it is a probable conjecture that its origin so far resembled the origin of the like division in English law, that it was due to the attempt to get rid of the difficulties attending the alienation of property by the old legal forms. 'There is,' says Gaius (ii. 40), 'among other nations (peregrini) only one kind of ownership or property (dominium), so that a man is either owner or not; and it was the same in the old Roman law, for a man was either owner 'ex jure quiritium,' or he was not. But ownership was afterwards divided, so that one man may now be owner of a thing ex jure quiritium, and another may have the same thing in bonis. For if in the case of a res mancipi, I do not transfer it to you by mancipatio, or in jure cessio, but only deliver it, the thing indeed will become yours beneficially (in bonis), but it will remain mine legally (ex jure quiritium), till you have acquired the property by usucapion; for as soon as the time of usucapion is completed, from that time it begins to be yours in full ownership (pleno jure), that is, the thing begins to be yours both in bonis and in jure, just as if it had been transferred by mancipatio or in jure cessio.' This passage seems to suggest a conjecture as to the origin of the distinction between legal and equitable property which was of so much importance in Roman law. The distinction between the two kinds of ownership or property was as clearly marked as in our system, though it was not applied to all the purposes to which this divided or double ownership is applied in our system.

3. The modes in which property is legally transferred from one person to another.

Property may either be acquired in a single thing, or in several things of the same kind at one time: or it may be acquired in a great variety of different kinds of things at the same time, which pass to the new owner, not as individual things, but as the component parts of a whole property. The Roman law designated the former mode of acquisition by the term acquisitio rerum singularum; and the latter by the term acquisitio per universitatem. Though the two modes of acquisition exist in our law, there are no names for them by which they are placed in opposition to one another. The case of acquisitio per universitatem, or of universal succession, occurs when a man is made a bankrupt or insolvent, and an assignee or assignees are appointed. [Bankrupt, p. 396; Insolvent, p. 496]; in which cases the whole of a man's property real and personal, as well as his rights and obligations generally, become the legal property of the assignee or assignees, and is applicable and must be applied according to the rules of law in the cases of bankruptcy and insolvency. With respect to personal property, universal succession occurs when a man by his last will appoints an executor; and an administrator with the will annexed, or without the will annexed when there is none, thereby acquires the whole personal property of the intestate. Both the heir and devisee also, in a sense, take by universal succession.

As to both singular and universal succession, the modes of acquisition of estates in things real are reducible to two general heads—descent and purchase. 'Descent or hereditary succession is the title whereby a man on the death of his ancestor acquires his estate by right of representation as his heir at law' (Blackstone); and an estate so acquired is commonly called an estate of inheritance.

Purchase, which is corrupted from the Latin word perquisitio, is defined by Littleton (i. 12) to be 'the possession of lands or tenements that a man hath by his deed or agreement, unto which possession he cometh not by title of descent from any of his ancestors, or of his cousins (consanguinei), but by his own deed.' Purchase as thus defined comprehends all the modes of acquiring property by deed or agreement, and not by descent; but it is not a complete description of purchase, as now understood, for it omits the mode of acquisition by will or testament, which however, when Littleton wrote, was of comparatively small importance, as the power of devising lands did not then exist, except by the custom of particular places. Blackstone makes the following enumeration of the modes of purchase—Escheat, Occupancy, Forfeiture, and Alienation. As to escheat, there is some difficulty in the classification, as the title appears to be partly by descent and partly by purchase.

The head of alienation comprehends every form by which a man transfers property to another: it comprehends therefore both alienations made by a person during his life, and the disposition of his property by his last will and testament. The disposition of property by will has this peculiarity about it, that though the instrument must be completed in legal form during the lifetime of the giver, the persons to whom the property is given do not thereby obtain the property; they only obtain it by the death of the giver, who by that event becomes incapable of giving, but whose continuing intention to give is testified by the continuing existence of the instrument of gift.

The particular modes of alienation by deed are to a certain extent determined by the estate which the alienor possesses, and the estate or estates which he intends to transfer. The forms of alienation are noticed under their various heads.

4. The legal capacity for the acquisition of estates in

lands, tenements, and hereditaments, is most briefly and conveniently shown by the enumeration of the classes of persons who labour under legal incapacity; and in like manner, as to the alienation or loss of estates, it is most conveniently shown by enumerating the persons who, owing to mental incapacity, infancy, or other causes, labour under legal incapacity to transfer or lose estates. This division comprehends as much of the status of aliens, infants, lunatics, and married women, as relates to the acquisition or loss of estates.

Personal Property is not sufficiently described by the term 'moveables,' for certain estates in land are personal property, and are comprehended under the term Chattels Real. Terms for years are an example of chattels real; and they pass together with the rest of a man's personal estate to the executor, the universal successor. Chattels Personal are all other personal property, and are said by Blackstone 'to be properly and strictly speaking things moveable, which may be annexed to or attendant on the person of the owner, and carried about with him from one part of the world to another. Such are animals, household stuff, money, jewels, corn, garments, and everything else that can properly be put in motion, and transferred from place to place.' Personal property as thus defined corresponds to the mobilia or res mobiles of the Roman law; but this is a very inadequate description of personal property as recognised by the English law. And herein we first perceive the greater certainty and distinctness of the law relating to real property compared with the law relating to chattels; the things which can be the objects of real property are definable, as well as the estates that can be had in them; the things that can be the objects of personal property are hardly determinable, and the estates, or more properly the interests, which a man may have in them, are perhaps also less determinate. As examples of objects of personal property, which in no way come within Blackstone's description, we may instance copyrights, which are things incorporeal, though not hereditaments, and are the objects of property.

A quantity of stock in the public funds is not money, though often talked of as such, but still it is property. Even debts due to a testator or intestate are considered as property with respect to probate and letters of administration; still they are not expressed by the term goods and chattels in the letters of administration, but by the term 'credits;' for as debts are not the property of a man to whom they are due, so they cannot become property because he happens to die. Things can be assigned by the person who has a claim to them, though they may be things which cannot be called his property: a chose in action is an instance of this. Blackstone observes: 'the money due on a bond is a chose in action; for a property in the debt vests at the time of forfeiture mentioned in the obligation, but there is no possession till recovered by course of law.' He had just before spoken of the nature of property in action being such that a man 'hath not the occupation, but merely a bare right to occupy the thing in question.' From this it appears that he treats a debt due to a man as a property belonging to him, whereas the debt due merely gives a right of action to recover a determinate sum of money, or a sum which is less than some determinate sum. In this instance, says Blackstone, 'the property or right of action depends upon an express contract or obligation to pay a stated sum.' Here he uses property and right of action as synonymous, which is incorrect; for property implies a determinate thing, and a right of action may be either for a determinate thing or to compel a person to do some determinate act. The thing claimed is properly enough called a 'thing in action,' but the action is not to have a thing, but that the defendant shall do a certain act. Blackstone observes, in a note, that the same idea and the same denomination of property prevailed in the civil law, but this is a mistake. In the first passage (*Dig.* 41, tit. 1, s. 52), to which he refers in support of his statement, it is clear that a corporeal definite thing is spoken of, which the commentator could hardly have doubted about, if he had given in his note the whole of the passage instead of a part of it. The passage is thus: 'a thing is a man's *in bonis*, whenever he can defend the possession of it by a plea (exceptio), or recover it when lost by an actio.' This actio would be in rem; the declaration of the plaintiff would affirm that the thing was his. In the other passage quoted by Blackstone (*Dig.* 50, tit. 16, s. 49), things which consist 'in actionibus, petitionibus, persecutionibus' are included among the things *in bonis*; but the things in action so spoken of are things which a man has not, as contrasted with things which a man has in his possession, and these are things corporeal, things determinate. Besides, even if we should admit that the Roman law treated a debt as a thing *in bonis*, it did not treat it as property, for a thing in bonis was not property in the sense in which Blackstone is here using property. Further, when a Roman claimed a debt, his declaration was that something ought to be given to him or done for his benefit by the defendant; and the 'giving' always meant giving something which did *not* belong to the plaintiff, for it was a principle of Roman law that you could not give to a man what already belonged to him. But the Roman law had a provision in these matters of which the commentator had not the slightest idea.

From these remarks it will appear, first, that there is a difficulty in classifying the things that are objects of personal property; second, that things, as choses in action, are not property, and yet they can be transferred (in equity) as if they were property. Accordingly it happens that it is sometimes difficult to say whether a particular thing is an assignable thing or not, whether in its nature it is capable of any transfer.

Property in Chattels may, like property in Things Real, vary as to quantity and quality of interest, though things personal are not capable of such extended and various modifications, analogous to estates, as things real are. As to quantity, that is, duration, a man may have the use of a personal thing for life, and another may have the absolute property in it after his death. As to quality, persons may own a thing personal as joint tenants and as tenants in common. There is an equitable property in chattels as well as in things real. Money, for instance, is often paid to a trustee, in order that he may give the interest of it to one person for life, and after his death pay the money to another. The trustee, so long as he holds the money, has the legal property in the money, and in the thing in which the money is invested. A legatee has only an equitable interest, even in a specific legacy, after his testator's will is proved, until the executor gives the thing to him, or in some clear way admits his right to it.

The modes of acquiring and losing personal property are reduced by Blackstone to the following principal modes: Occupancy; Prerogative, whereby a right accrues to the crown or the crown's grantee; Forfeiture, which is a punishment for a crime or misdemeanour; Custom, as heriots, &c.; Succession, by which term Blackstone understands the capacity of a corporation aggregate to take what their predecessors had; Marriage, by which the husband acquires the chattels of the wife, and the right of suing for her choses in action, and a peculiar kind of interest in her chattels real; Judgment; Gift or Grant; Contract; Bankruptcy, so far as relates to chattels; Testament; Administration. The enumeration taken from Blackstone is not here offered as one that is complete or altogether unexceptionable. Under Contract Blackstone includes sale, as to which it may be observed that the formalities required by the law for the transfer of ownership in things personal are few; but the difficult questions which arise as to the transfer of property in personal things are probably much more numerous than in the case of estates in things real.

Under Contract he also comprehends bailment, by which 'a special qualified property is transferred from the bailor to the bailee together with the possession.' This qualified property, as it is called, gives the bailee a right of action against all persons who injure or take away the chattels; and Blackstone, as usual, finds a reason for this right of action. This right of action is however really founded on the right of possession, and it is just the same right of action that a man has who finds a thing, against any person, except the owner, who injures or takes away the thing. This right, when understood, is in all respects consistent with sound principles; and there is no objection to calling it a right founded on a qualified property, when the term qualified property is rightly understood. Under contract, he also includes hiring and borrowing, and these also are contracts which, he says, may transfer a qualified property to the hirer or borrower. The same remarks apply to this kind of property as to that acquired by bailment. There is however a case in which a man must acquire an absolute property by borrowing, as in the case of the Roman Mutuum, when the thing borrowed is a thing which consists 'pondere, numero, or mensurâ,' as, for instance, so many pounds of butter. The distinctions of the Roman Law between Hiring, 'Locatio et Conductio,' Lending, 'Mutuum,' 'Commodatum,' and 'Depositum,' are founded on unchangeable principles, and are expounded in that system with a clearness which, in this respect, ours perhaps does not admit.

The incapacities of persons as to acquiring Personal Property are fewer than those as to Real Property; and the incapacities to transfer and lose are also fewer. But a complete enumeration of the classes of persons who labour under either of these incapacities, and the particular incapacities of each of such classes, would probably be more difficult than a like enumeration as to Estates in Real Property.

PROPHECY (*προφητεία*, a foretelling, or the power of foretelling), in its popular acceptation is a foretelling, or a thing foretold. It may however be more correctly defined a speaking by inspiration, whether the things spoken relate to the present, the past, or the future; but it must be observed that this definition assumes inspiration as an historical fact.

In the Septuagint, *propheteia* (*προφητεία*) answers to *nevuah* (נְבוּאָה), from *nava* (נָבָא), which, according to Gesenius is to 'bubble forth,' and so, to utter words copiously, as persons do who speak under a divine afflatus, or a strong excitement. In classical Greek, *prophêtes* (*προφήτης*) corresponds with the Latin *vates*, which indeed may be regarded as the same word without the preposition. Thus St. Paul uses *prophetes* (*Tit.*, i. 12), which is rendered 'prophet' in the authorised version, but 'poet' by Tyndale; and probably Epimenides is meant. S. Chrysostom (*Hom. in* 1 *Cor.*) says that *prophetes* is the same as *hermêneutes* (*ἑρμηνευτής*), an interpreter; and Festus says that the chief priests of the temples and interpreters of the oracles were by the antients called prophets. In *Exod.* vii. 1, God says to Moses, 'I have made thee a God to Pharaoh, and Aaron thy brother shall be thy prophet,' *i.e.* interpreter; or, as it is expressed (iv. 16) 'He shall be to thee instead of a mouth.' Abraham is called a prophet (*Gen.*, xx. 7), *i.e.* an intercessor between God and man. In the New Testament, prophesying is several times used in the sense of interpreting the hard places of the Old Testament, as Themistius calls a man who interpreted the obscurities of Aristotle, 'the prophet of Aristotle.' 'The sons of the prophets' appear to have been pupils in the schools of the prophets, and to have been trained for the office of instructing the Jewish people orally upon the principles laid down in the Mosaic law. Some of the Jewish prophets were particularly distinguished as writers, and their instructions mingled with predictions (called by the general title of prophecies) were added to the other sacred books, and became of canonical authority. These prophets thus carried on, enlarged, and spiritualised the code which had originally been given by Moses; and they probably handed down through each generation certain doctrines made known to the patriarchs, which the law was not designed to unfold.

Under ORACLE it is observed that there were current in antient Greece numerous so-called prophecies, such as those of Bacis and Musæus, mentioned by Herodotus (viii. 20, 77, 96; ix. 43). Dr. Barrow is of opinion that, 'though many of these prophecies were dark and ambiguous, or captious and fallacious, yet some were very clear and express, according as God was in his wisdom pleased to use the ministry of those spirits, which immediately conveyed them in directing men for their good, or misguiding them for their deserved punishment, such as were for instance that concerning Cyrus his conquering the Lydians; that concerning the battle at Salamis; that concerning the battle of Leuctra; and divers others which occur in stories composed by wise men of the wisest nations.' (*Sermon* ix. *on the Creed.*) When however such prophecies come to be rigidly examined, they will be found of the kind of productions concerning which Lord Bacon says, 'That that hath given them grace, and some credit, consisteth in three things. First, that men mark when they hit, and never mark when they miss..... The second is, that probable conjectures, or obscure traditions, many times turn themselves into prophecies, while the nature of man, which coveteth divination, thinks it no peril to foretell that which indeed they do but collect..... The third and last (which is the great one) is, that almost all of them, being infinite in number, have been impostures, and by idle and crafty brains merely contrived and feigned after the event past.' (Bacon's *Essays.*) But this was not the case with the prophecies recorded in the Bible. Some of these were extant in books written long before the events took place to which they refer, such as the prophecy concerning Abraham's posterity, their extraordinary increase, their sufferings in Egypt four hundred years, their sojourning in the wilderness, and their possessing at length the land of Canaan; the prophecy concerning Josiah (1 *Kings*, xiii. 2), who was expressly named 361 years before the occurrence of the event in which he was the chief agent (2 *Kings*, xxiii. 15, 16); the prophecy concerning Cyrus, who is also mentioned by name (*Isaiah*, xliv., xlv.); his conquests, his restoring the Jews from exile, and his rebuilding of Jerusalem; the prophecy of Jeremiah concerning the Captivity, and its duration 70 years; the prophecy of Daniel (viii.) concerning the profanation of the Temple by Antiochus Epiphanes, with a description of this man's temper, countenance, &c., 408 years before the accomplishment of the event. These prophecies relate to the Jewish people in particular; but there are others relating to Tyre, and Egypt, and Nineveh, and Babylon, which, in a manner no less striking, present, in all their circumstances of delivery and fulfilment, a perfect contrast to the supposed predictions of the ancient pagans. The numerous prophecies in the Old Testament pertaining to the Messiah, with their accomplishment recorded in the New Testament, and the prophecies of Jesus and his Apostles, are so familiar to the minds of all, that they need not be specified. The prophecies of the Old and New Testament, which have been long fulfilled, afford altogether an amount of evidence which, if really understood, it seems impossible to resist, in proof of the Bible being a revelation from God. Upon the question when prophecy ceased to be given among the Jews, and when among the Christians, and upon the subject of unfulfilled prophecy, we must abstain from entering.

The prophecies of the Old and New Testament are understood by all believers in scriptural prophecy to be predictions of future events pronounced by persons who, on the occasion of delivering such predictions, were directed and governed by the Deity. The first thing to establish in the examination of these prophecies is the genuineness of the books in which they are contained. The question is, whether the prophecies in the form in which we have them, were delivered before the events to which it is alleged that they refer. This is purely a matter of historical criticism, and in no respect differs in the manner of carrying on the investigation, from an inquiry of a like kind as to any other book. The next inquiry is to compare the alleged prophecy with the events of which it is alleged that it was a prediction. This, though apparently the easier part of the inquiry, is one where as much difference of opinion may exist. Some of the prophecies are clear and precise in their terms; and when the former part of the inquiry has had a satisfactory result, no unprejudiced person can doubt that the prophecies do refer to certain definite events. Some of the prophecies are in their terms vague and general; and others refer to events which, it is admitted, have not yet been accomplished. So far as it is admitted that any prophecy has not been accomplished, so far it must be admitted that prophecy fails in being substantiated by the only evidence that can establish its truth. It is then on those events which all believers allege to be events accomplished, in conformity to genuine predictions, that the proof of prophecy depends. The method of investigation is that which has been already mentioned, and every man should come to it with an unprejudiced mind.

On prophecy in general the reader may be referred to John Smith's *Select Discourses*, 4to., Cambr., 1673, and 8vo., London, 1821; Sherlock's *Use and Intent of Prophecy*, 8vo., London, 1725; Bishop Newton's *Dissertations on the Prophecies*, often printed; with other well-known works treating directly or indirectly on the subject.

PROPITHE'CUS, Mr. Bennett's name for a genus of quadrupeds allied to the *Lemurs*, and thus characterised by him:—

Muzzle moderate. Hinder extremities longer than the anterior ones. Index abbreviated. Tail long, hairy.

Dental Formula:—Incisors $\frac{4}{4}$; canines $\frac{1}{1}\ \frac{1}{1}$; molars —,

(upper) two first cuspidate, the third elongated, externally bituberculated, the fourth like the preceding; (lower) first unicuspidate, second and third plurituberculate.

Example, Propithecus Diadema.

Description.—Face nearly naked, with short blackish hairs about the lips, and equally short yellowish-white hairs in front of the eyes. Above the eyes, the long, silky, waved, and thickly-set hairs which cover the body commence by a band of yellowish white crossing the front and passing beneath the ears to the throat. This is succeeded by black, extending over the back of the head and neck, but becoming freely intermingled with white on the shoulders and sides, the white gradually increasing backwards so as to render the loins only slightly grizzled with black. At the root of the tail fulvous, that colour gradually disappearing until the extreme half of the tail is white with a tinge of yellow. Outer side of the anterior limbs, at the upper part, of the same colour as the sides, below which it is pale fulvous. Hands black, except tufts of long fulvous hairs at the extremities of the thumb and fingers, extending beyond and covering the nails. Outer sides of the hinder limbs, after receiving a tinge of fulvous from the colour surrounding the root of the tail, of a paler fulvous than the anterior limbs: this becomes much deeper on the hands, which are fulvous except on the fingers, where there is a very considerable intermixture of black, the terminal tufts, equally long with those of the anterior hands, being, as in them, fulvous. The under surface white throughout, except the lower part of the throat, where it is of the same colour with the sides of the body.

Hairs generally long, silky, waved, erect, and glossy; shorter and more dense on the crupper, where they offer a sort of woolly resistance. General character of those on the tail, that of the body hair, but shorter.

Thumb of anterior hands slender, placed far back, and extremely free; length $1\frac{1}{4}$ inch, extremity of its penultimate phalanx reaching slightly beyond the end of the metacarpal bone of the index. Index $1\frac{3}{4}$ inch in length, its extremity ranging with the middle of the penultimate phalanx of the second finger. Length of second finger 2 inches; that of third finger $2\frac{1}{4}$ inches. Length of carpus and metacarpus 2 inches.

Thumb of hinder hands very strong, placed forwards and ranging with the fingers, 2 inches long; index $2\frac{1}{2}$ inches, the pointed nail extending half an inch beyond: length of second finger, $3\frac{1}{2}$ inches; of tarsus and metatarsus, 3 inches.

Length of body and head, measured in a straight line, 1 foot 9 inches; of the tail, 1 foot 5 inches. Anterior limbs, exclusive of hands, $7\frac{1}{2}$ inches in length from the body; posterior limbs, $10\frac{1}{2}$ inches.

Muzzle shorter than in the *Lemurs* generally; the distance from the anterior angle of the orbit to the tip of the nose ($1\frac{1}{4}$ inch) being equal to that between the eyes. Ears rounded, concealed in the fur: length 1 inch; breadth $1\frac{1}{4}$ inch.

Affinities, &c.—Mr. Bennett remarks that *Propithecus* is essentially distinguished from *Lemur*, the genus to which it most nearly approaches, by the number and form of its teeth, and especially by the form of the incisors of the lower jaw, which constitute apparently a regular series, a structure unknown in any other Lemuridous animal. This difference, striking as it is, is however, he observes, more of an apparent than a real deviation from the type of the family, inasmuch as a tendency to diverge laterally towards their cutting edges is to be found in the upper incisors of a *Lemur*; and it is only the extreme development of this tendency that gives to the teeth of *Propithecus* a peculiarity of character rather resembling at first sight that of the *Monkeys* than the *Lemurs*. The number of the incisors of the lower jaw, he adds, differs from that of *Lemur*, but occurs in another genus, *Indris* [LICHANOTUS], and he remarks that in *Propithecus*, as in *Indris*, the canine teeth of the lower jaw close behind those of the upper, a conformation which tends to invalidate the opinion of M. Geoffroy St. Hilaire, that the outer of the six incisors of the lower jaw ought rather to be regarded as canine teeth, the usual position of the lower canines when the mouth is closed being anterior to the upper. The number of false molars, continues Mr. Bennett, in *Propithecus*, is one less in each jaw than in *Lemur*, and they are less smooth and not so acutely triangular; the second in the upper jaw being in fact somewhat tuberculate on its inner edge, and forming, as it were, a transition from the false to the true molars, between which it is placed. The posterior molars were not examined. Mr. Bennett concluded by observing that the external characters by which *Propithecus* is distinguished from *Lemur* are its shorter muzzle, terminated by more approximate nostrils, the upper margin of which appears to be only slightly bilobated; its rounded ears; the marked disproportion in length between its hinder and anterior extremities; the greater length of its hands, especially of the anterior; the shortness of its anterior thumb, which is also placed much farther back; the marked abbreviation of the anterior index; the development and power of the hinder thumb, which is nearly an equal opponent to the whole of the fingers; and the comparative shortness of the hairs by which the tail is covered.

Locality.—Madagascar, whence the specimen was sent and presented to the Zoological Society by C. Telfair, Esq., Corr. Memb. Z. S. Habits unknown. (*Zool. Proc.*, 1832.)

PROPONTIS. [MARMARA, SEA OF.]

PROPORTION. There must be in the mind of every person, antecedently to all mathematical instruction, a perfect conception of proportion, though not perhaps of the manner of measuring magnitudes with a view to express their proportions by means of numbers. All who can trace the resemblance of a drawing to the original, or have the least notion of the use of a map, are in possession of the fundamental notions on which a theory of proportion can be founded. The term RATIO is that under which the first part of the subject should be treated, and the article cited will contain matter preliminary to the present one. It will be sufficient for our present purpose to state that the ratio or relative magnitude of two magnitudes is to be measured by the number of times or parts of times which one is contained in the other, whenever the two are commensurable; and we shall now confine ourselves to the purely mathematical treatment of the theory of proportion, and shall avoid, as much as the nature of the subject will admit, all discussion of the notion of ratio considered as a magnitude.

We cannot well explain the nature of the difficulty which occurs in the theory of proportion, without a prior reference firstly to the purely arithmetical treatment of the subject, and, secondly, to the *practical* sufficiency of this method which is the necessary consequence of our physical constitution.

If all magnitudes of the same kind were necessarily commensurable, that is, if any one among them being taken as a unit, the rest were all expressible by multiples, aliquot parts or submultiples, and multiples of aliquot parts, of the unit chosen, no difficulty would arise in making the subject of proportion purely arithmetical. For let a and b represent the units, parts of units, or both, in two magnitudes of the same kind (as two lines); any sufficient demonstration of the rule for the division of one fraction by another will show that a contains b precisely a number of times and parts of times. If then we say that a is to b in the same proportion as c to d, we mean that a contains b precisely such times and parts of times as c contains d; that is, we assert the equation

$$\frac{a}{b}=\frac{c}{d};$$

the mathematical treatment of which is so easy, that no one who can solve a simple equation can be stopped for a moment by the difficulty of any consequence of it. The following proposition, which may be proved generally, contains all the consequences which are most useful. Let a, b, c, and d be (in the arithmetical sense) proportional: take any two functions of a and b, which are homogeneous and of the same dimension (such as $ab+b^2$ and a^2-b^2). Take corresponding functions of c and d (which are $cd+d^2$ and c^2-d^2); then the four numbers so obtained are also proportional (that is, $ab+b^2$ contains a^2-b^2 as many times and parts of times as $cd+d^2$ contains c^2-d^2).

In measuring magnitudes of which the numerical representatives are afterwards to be submitted to calculation, it necessarily follows, from the imperfections of our senses, that some imperceptible amount of magnitude must always be neglected or added; so that, for example, that which we call a line of 3 inches long means something between 2·9 and 3·1, or 2·99 and 3·01, or 2·999 and 3·001, according to the degree of accuracy of the measurement. All magnitudes therefore are practically commensurable; for suppose, in the case of weights for example, that a grain is taken as the unit, and that the ten-thousandth part of a unit is considered as of no consequence; then by taking every weight only to the nearest ten-thousandth of a grain, they may every one be expressed arithmetically with a conventional degree of precision, which for every purpose of application will do as well as though it were perfectly accurate.

The discovery of INCOMMENSURABLE magnitudes, one of the most striking triumphs of reason over the imperfection of the senses, was made at a very early period; since the demonstration of their existence, the classification (to a certain extent) of their species [IRRATIONAL QUANTITIES], and the means of overcoming the difficulties which they present, appear in the writings of Euclid. A moment's consideration will show that a property of numbers, a relation of figure in geometry, a general law of nature, may be inferred from induction with a degree of probability which will amount to moral certainty, both as to the exactness and universality of the property, relation, or law. But the existence of incommensurable magnitudes can never be made certain, except by absolute deduction: no attempt at measurement, a *minimum visibile* existing, could show the non-existence of any common measure, however small. Suppose for instance that, having provided means of measurement which can always be depended on to show the *thousandth* of an inch, but nothing less, a person should accurately (as the word is commonly used) lay down squares of one, two, &c. inches in the side, with a view to render the existence of a common measure to the side and diagonal exceedingly improbable by experiment. If not before, he would be baffled by the square whose side is 2378 inches, the diagonal of which could not by his measures be distinguished from 3363 inches, from which it differs only by about the *five-thousandth* part of an inch. And let any greater degree of exactness be attained in the means of measurement, short of positive accuracy, a reasoner on the subject could still predict a square which should defeat the object sought to be attained.

The mere existence of incommensurables, to say nothing of their frequent occurrence, and the impossibility of avoiding them, renders the arithmetical theory of proportion inexact in its very definition. If we would say, for instance, that the diagonal of a larger square is to its side as the diagonal of a smaller square is to its side, we enunciate a proposition the meaning of which is unsettled. For if we mean to assert that the larger diagonal contains the larger side as many times or fractions of times as the smaller diagonal contains the smaller, it is answered, by those who wish for precise notions, that neither diagonal contains its side any exact number of times or parts of times. If we should say that the larger diagonal lies between 1·414213 and 1·414214 times the larger side, and that the smaller diagonal also lies between 1·414213 and 1·414214 times the smaller side, and if we should show this to be true, we certainly show that we could produce lines very nearly equal to the diagonals, which are, under the arithmetical definition, proportional to the sides; and that this might be done without altering either diagonal by so much as the millionth part of the side. And the ten-millionth, hundred-millionth, or any aliquot part of the side, however small, might be substituted for the millionth, without detriment to our power of showing the truth of the proposition. If we use the means by which this process may be carried on *ad infinitum*, we may perhaps be said to have established the truth of the proposition that the diagonals of squares are as their sides. But if we in any manner stop short of this, we destroy the rigorous character of geometry, and produce a system of mathematics which, like a common table of logarithms, is true to a certain number of places of decimals, and not farther. It is obvious that such a system of mathematics, like the table with which we have compared it, is sufficient for the purposes of practical application; nor have we the least quarrel with those who, desiring an instrument only, take one which is sharp enough for their purpose. We only complain of them when they assert and teach others that their tool has an edge keen enough to separate the minutest truth from the minutest falsehood; whereas, on examining it with a powerful microscope, we find the so-called sharp edge capable of being magnified into a plane of any dimensions, though it may appear a sharp edge to the unassisted senses.

The imperfection of the arithmetical definition of proportion is universally admitted, while the complexity of the rigorous definition by which Euclid supplied its place is almost as universally felt to be a grievance. Many attempts have been made to avoid the trouble without incurring the reproach of inaccuracy. One or two of these we shall notice.

Legendre, in his otherwise excellent work on geometry, refers the student to works on arithmetic for the theory of proportion; and, having stated that when A is to B as C to D, it is known that A×D=B×C, adds (twelfth edition, page 61), 'This is certainly true for numbers; it is true also for any magnitudes, provided they can be expressed, or that we imagine them expressed by numbers, and this we may always suppose.' A system of geometry which tells the learner in so many words that he may always suppose that which is not true, needs no further comment, even though Legendre were its author. It is true that in subsequent parts of the work we find demonstrations adapted to the case of incommensurable quantities, but they want that most important element of a proposition involving proportions, namely, a definition of what the term means; these demonstrations turn upon the theorem that when four quantities are proportional, the first is greater than, equal to, or less than the second, according as the third is greater than, equal to, or less than the fourth; but it has not been previously stated what the author means by four quantities being proportional. In the English translation of the preceding work, a preliminary chapter is added on proportion, in which the definition given as to incommensurable magnitudes amounts to the following:—when A and B are incommensurable, and also C and D, the four are said to be proportional when A′ and C′ can be found, as near as we please to A and C, and which, being commensurable with C and D, are proportional to them, in the arithmetical sense of the term. This is a sufficient definition; but it really amounts to that of Euclid (as do all sufficient definitions which we have seen), and is not so easily used.

M. Lacroix (*Elémens de Géométrie*, p. 5) makes the approximate finding of a common measure stand in place of an exact process, and, fairly stating that the error of the process may be made too small to be visible, rests the exactness of his geometry on its not being sensibly erroneous.

The author of the 'Elements of Geometry,' in the 'Library of Useful Knowledge,' states the proportion of incommensurable magnitudes to consist in 'their ratios admitting of being approximately represented by the same numbers, *to how great an extent soever* the degree of approximation may be carried.' In virtue of the words in italics, this definition may be considered as being, when properly used, capable of forming the basis of an exact theory; and that it is properly used in the work cited we fully admit, since its first application is to the establishment of the definition of Euclid. The only objection we should make to the work in question is that its expressions (page 48) would lead the student to imply that commensurability is the general rule, and incommeasurability the exception; an extended theory is given, because magnitudes are not always commensurable. Now it is important the student should know, and should always bear in mind, that of two magnitudes of the same kind taken at hazard, or one being given and the other deduced by a geometrical construction, it is very much more likely that the two should be incommensurable than that they should be commensurable. So that the apparently cumbrous theory of proportion is not introduced to meet a few cases which sometimes occur, but to prevent the majority of instances from being treated incorrectly.

The definition of proportional quantities given by Euclid is as follows*:—'Magnitudes are said to have the same ratio to one another, the first to the second, and the third to the fourth, when equimultiples of the first and third, and equimultiples of the second and fourth, whatever the multiplications may be, yield a multiple of the first greater than, equal to, or less than, that of the second, according as the multiple of the third is greater than, equal to, or less than, that of the fourth.' That is, if A, B, C, and D be the four magnitudes, and m and n any two whole numbers whatsoever, mA must be greater than, equal to, or less than nB, according as mC is greater than, equal to, or less than nD. Otherwise thus, whatever whole numbers m and n may be, A must exceed, equal, or fall short of n-$m$ths of B, according as C exceeds, equals, or falls short of n-$m$ths of D. A person practised in algebra would comprehend the definition most easily when stated thus: $m\mathrm{A} - n\mathrm{B}$ must have the same sign as $m\mathrm{C} - n\mathrm{D}$, for all whole values of m and n.

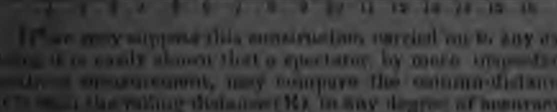
This definition equally applies whether A and B be commensurable or incommensurable, since no attempt is made to measure B by an aliquot part of A. The two questions which must be asked, and satisfactorily answered, previously to its reception, are as follows:—

1. What right had Euclid, or any one else, to expect that the preceding most prolix and unwieldy statement should be received by the beginner as the definition of a relation the perception of which is one of the most common acts of the mind, since it is performed on every occasion where similarity or dissimilarity of figure is looked for or presents itself?

2. If the preceding question should be clearly answered, how can the definition of proportion ever be used; or how is it possible to compare every one of the infinite number of multiples of A with every one of the multiples of B?

To the first question we reply, that not only is the test proposed by Euclid tolerably simple, when more closely examined, but that it is, or might be made to appear, an easy and natural consequence of those fundamental perceptions with which it may at first seem difficult to compare it. To elucidate this, suppose the following case:—

There is a straight colonnade composed of columns at equal distances from each other, the first being distant from a bounding wall by a length equal to the distance between any two successive columns. In front of the colonnade let there be a row of railings* equidistant from each other, the first being at the same distance from the wall at which the railings are from each other. Let the columns be numbered from the wall, and also the railings; remember also that it is not supposed that there goes any exact number of railings to the interval of two columns, but that the interval of the columns may be to the interval of the railings in any ratio, commensurable or incommensurable:



If we now suppose this construction carried on to any extent, it is easily shown that a spectator, by mere inspection and without measurement, may compare the column-distance (C) with the railing-distance (R) to any degree of accuracy. For example, since the tenth railing falls between the fourth and fifth columns, it follows that 10 R is greater than 4 C and less than 5 C, or that R lies between $\frac{4}{10}$ of C and $\frac{5}{10}$ of C. To gain a more accurate notion he may examine the ten-thousandth railing; if it fall between the 4674th and 4675th columns, it follows that 10,000 R lies between 4674 C and 4675 C, or R lies between $\frac{4674}{10000}$ and $\frac{4675}{10000}$ of C. There is no limit to the degree of accuracy thus obtainable; and it can also be shown that the ratio of C and R is determined when the order of distribution of the railings among the columns is assigned *ad infinitum*; or, which is the same thing, when the position of any given railing can be found, as to the numbers of the columns between which it lies. Any alteration, however small, in the place of the first railing, must at last affect the order of distribution. Suppose for instance, that the first railing is moved farther from the wall by one part in a thousand of the distance between the columns, the second railing must then be pushed forward twice as much, the third three times as much, and so on; those after the thousandth are pushed forward more than a thousand times as much, that is, by more than the interval between the columns; or the order with respect to the columns is deranged.

Let it now be proposed to make a model of the preceding construction, in which c shall be the distance between the columns, and r that between the railings. It needs no definition of proportion, nor anything more than the conception which we have of that term prior to definition (and with which we must show the agreement of any definition we may adopt) to assure us that C must be to R in the same proportion as c to r, if the model be truly formed. Nor is it drawing too largely on that conception of proportion if we assert that the distribution of the railings among the columns in the model must be everywhere the same as in the original: for example, that the model would be *out of proportion* if its 58th railing fell between the 18th and 19th columns, while the 58th railing of the original fell between the 17th and 18th columns. How then the question as to the dependence of Euclid's definition upon common notions is settled; for the obvious relation between the construction and its model which has just been described contains the collection of conditions, the fulfilment of which, according to Euclid, constitutes proportion. According to Euclid, whenever mC exceeds, equals, or falls short of nR, then mc must exceed, equal, or fall short of nr: by the most obvious property of the preceding constructions, according as the mth column comes after, opposite to, or before the nth railing, in the original, the mth column must come after, opposite to, or before the nth railing, in the correct model.

That the test proposed by Euclid is necessary, appears from the preceding; and also that it is sufficient. For, admitting that, to a given original, with a given column-distance in the model, there is one correct model railing-distance (which must therefore be the one which distributes the railings among the columns as in the original), we have seen that any other railing distance, however slightly different, would at last give a different distribution: that is, the correct distance, and the correct distance only, satisfies all the conditions required by Euclid's definition.

Let us now, by the *distribution* of one set of magnitudes among those of another set, agree to mean the placing of the first magnitudes among those of the second set, the latter having been previously arranged in ascending order of magnitude. Thus, in the following instance, we distribute the multiples of 3 among those of 8, the latter being in Roman numerals:—

3 6 VIII 9 12 15 XVI 18 21 XXIV 27 30 XXXII &c.
24

This use of the word distribution having been well learnt, the following way of stating the definition will be easier than that of Euclid. 'Four magnitudes, A and B of one kind, and C and D of the same or another kind, are proportional when all the multiples of A can be distributed among the multiples of B in the same intervals as the corresponding multiples of C among those of D.' Or, whatever numbers m and n may be, if mA lies between nB and $(n+1)$B, mC lies between nD and $(n+1)$D.

If the preceding test be always satisfied from and after any given multiples of A and C, it must be true before those multiples. For instance, let the test be always satisfied from and after 100 A and 100 C; and let 5 A and 5 C

* [illegible]

* The Greek of Euclid's definition is very short, and can only be literally rendered into English by circumlocution. Ἐν τῷ αὐτῷ λόγῳ μεγέθη λέγεται εἶναι, πρῶτον πρὸς δεύτερον καὶ τρίτον πρὸς τέταρτον, ὅταν τὰ τοῦ πρώτου καὶ τρίτου ἰσάκις πολλαπλάσια τῶν τοῦ δευτέρου καὶ τετάρτου ἰσάκις πολλαπλασίων, καθ' ὁποιονοῦν πολλαπλασιασμόν, ἑκάτερον ἑκατέρου ἢ ἅμα ἐλλείπῃ, ἢ ἅμα ἴσα ᾖ, ἢ ἅμα ὑπερέχῃ ληφθέντα κατάλληλα.

be instances for examination, falling before 100 A and 100 C. Take some multiple of 5 which will exceed 100, say 50 times, and let it be found on examination that 250 A lies between 678 B and 679 B; then 250 C lies between 678 D and 679 D. Divide these by 50, and it follows that 5 A lies between 13 $\frac{28}{50}$ B and 13 $\frac{29}{50}$ B, and still more between 13 B and 14 B. Similarly 5 C lies between 13 $\frac{28}{50}$ D and 13 $\frac{29}{50}$ D, and still more between 13 D and 14 D. Or 5 A lies in the same interval among the multiples of B in which 5 C lies among the multiples of D: and the same demonstration applies to any other instance.

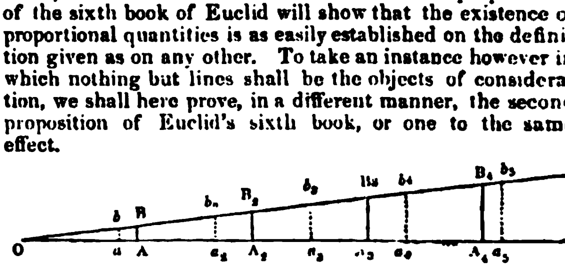
Again, the test is also satisfied if the multiples of any multiple (m) of A are distributed among the multiples of any multiple (n) of B in the same manner as the multiples of m C among the multiples of n D: for instance, if the multiples of 3 A be distributed among those of 5 B in the same manner as the multiples of 3 C among those of 5 D. Let 11 A and 11 C be given for examination: take any multiple of 3 greater than 5, say 3×3, or 9, and examine 11 (9 A) and 11 (9 C), or 33 (3 A) and 33 (3 C). Let 33 (3 A) lie between 27 (5 B) and 28 (5 B); then by hypothesis 33 (3 C) lies between 27 (5 D) and 28 (5 D). Divide all by 9, and we find that 11 A lies between 15 B and 15 $\frac{5}{9}$ B, while 11 C lies between 15 D and 15 $\frac{5}{9}$ D. Hence 11 A lies between 15 B and 16 B, while 11 C lies in the same interval among the multiples of D: and in the same manner any other instance may be proved.

The principles of the fifth book of Euclid are by many supposed to be inevitably connected with the apparatus of straight lines drawn parallel to one another, by which Euclid represents his magnitudes and their multiples. This is not the case; and the simple algebraical expression of magnitudes by large letters, and of numerical multipliers by small ones, will very much facilitate the demonstrations, without altering anything but mere modes of expression.

The next point to be considered is the infinite character of the definition of proportion; four magnitudes are not to be called proportional, until it is shown that every multiple of A falls in the same intervals among the multiples of B, in which the same multiple of C is found among the multiples of D. So that this definition is a negative one, like that of parallel lines, which may be thus stated: two lines are parallel when every point of one of them, however far produced, is on one side of the other. We might expect then to find that the test of *disproportion* is simple and positive, and an examination of the illustration already produced will confirm this.

Suppose that the distribution of the railings among the columns should be found to agree in the model and the original as far as the millionth railing. This proves, as we have seen, only that the railing-distance of the model does not err by the millionth part of the corresponding column-distance; for if it did err so much, the multiplication of the error a million-fold would have placed the millionth railing (if none before it) wrong by at least one interval. It is then obvious that no examination of individual cases, however extensive, will enable an observer of the construction and its model to affirm the proportion or deny disproportion: all that it can do is to enable him to fix limits (which he may make as small as he pleases) to the disproportion, if any. But a single instance may enable him to deny proportion or affirm disproportion and also to state which way the disproportion lies. Let the 19th railing in the original fall beyond the eleventh column, while the 19th railing of the (so called) model does not come up to the eleventh column. It follows from this one instance, that the railing-distance of the model is too small relatively to the column-distance, or that the column-distance is too great relatively to the railing distance. That is, the proportion of r to c is less than that of R to C, or the proportion of c to r is greater than that of C to R. Similarly, with respect to two straight lines, no examination of pairs of points, one in each, will enable the examiner to affirm their parallelism or deny their intersection: while, at the same time, the examination of one pair of points may enable him to affirm intersection or deny parallelism. Hence it appears that, obvious as the notion of proportion may be, it is more easy, in a mathematical point of view, to define disproportion, and to make proportion consist in the absence of all disproportion. Similarly, obvious as is the notion of parallelism, and the connection of the non intersection of two straight lines with that of their always keeping the same distance with each other, it is more easy to define this relation by the absence of all intersection than by any of its positive properties.

The negative character of the definition of parallels does not prevent it from being very easily proved that such lines exist; and an examination of the first or last propositions of the sixth book of Euclid will show that the existence of proportional quantities is as easily established on the definition given as on any other. To take an instance however in which nothing but lines shall be the objects of consideration, we shall here prove, in a different manner, the second proposition of Euclid's sixth book, or one to the same effect.



Let OAB be a triangle, to one side of which ab is drawn parallel, and in OA produced set off AA_2, A_2A_3, &c. equal to OA, and aa_2, a_2a_3, &c. equal to Oa. Through every one of the points so obtained draw parallels to AB, meeting OB produced in b, b_2, B_2, &c. Then it is easily proved that bb_2, b_2b_3, &c. are severally equal to Ob, and BB_2, B_2B_3, &c. to OB. Consequently a distribution of the multiples of OA among those of Oa is made on one line, and of OB among those of Ob on the other. The examination of this distribution in all its extent (which is impossible, and hence the apparent difficulty of using the definition) is rendered unnecessary by the known property of parallel lines. For since A_3 lies between a_3 and a_4, B_3 must lie between b_3 and b_4; for if not, the line A_3B_3 would cut either a_3b_3 or a_4b_4. Hence without inquiring where A_m *does* fall, we know that if it fall between a_n and a_{n+1}, B_m must fall between b_n and b_{n+1}: or if $m\times$OA fall in magnitude between $n\times$Oa and $(n+1)\times$Oa, then $m\times$OB must fall between $n\times$Ob and $(n+1)\times$Ob. Thus it is established that OA is to Oa as OB to Ob.

The propositions of the fifth book become very simple when the definition is fully elucidated, and algebraical expression is substituted for the words at length of Euclid. They will be found thus treated in Playfair's or Lardner's editions of Euclid, and in the 'Connection of Number and Magnitude' (London, 1836).

When quantities are commensurable, a multiple of one may be found which is exactly equal to a multiple of the other: thus if A$=3\frac{4}{13}$B, 13A$=$43B. In this case the arithmetical definition of proportion is sufficient, and the other may be shown to follow from it. Let A$=3\frac{4}{13}$B, and C$=3\frac{4}{13}$D, so that, arithmetically speaking, A is to B as C to D. Let mA lie between nB and $(n+1)$B, or $(3\frac{4}{13}m)\times$B lies between nB and $(n+1)$B. Then the number or fraction $3\frac{4}{13}m$ must lie between n and $n+1$; whence $(3\frac{4}{13}m)$D lies between nD and $(n+1)$D, or mC lies between nD and $(n+1)$D.

It is however perfectly allowable to leave out of sight the possible case in which a multiple of A is exactly equal to a multiple of B; since if the test be true in all other cases, it is therefore true in this. For, if possible, let 4A$=$7B, and 4C be (say) greater than 7D. Then m(4C) exceeds m(7D) by m times this difference, which may be made as great as we please, or 4mC, and multiples succeeding it, may be made to fall in an interval as many intervals removed from that of 7mD and $(7m+1)$D as we please. But 4mA is equal to 7mB, whence $(4m+1)$A, &c. must fall among the multiples of B in intervals of given nearness* to the interval of 7mB and $(7m+1)$B. Consequently the multiples of A following 4mA cannot always fall among the multiples of B in the same intervals as the same multiples of C among those of D; and the rest of the test cannot be true, unless 4C$=$7D; that is, if the rest of the test be true, then 4C$=$7D.

The following question will enable the reader to see for himself how far he is able to apply the method of Euclid. Returning to the illustration, suppose that the columns, instead of being mathematical lines, are of a given thickness, and that the columns in the model are of a proportionate thickness; let it also be supposed that when a railing is projected upon the column, there are no means of determining on which side of the axis of the column it falls. It is to be shown that if the distribution be according to the definition as to every railing which is not so projected, and

* We leave the reader to put this demonstration into a more exact form

about which there is therefore no doubt, it must also be true in every case in which the doubt exists.

The advantages of the study of proportion in the manner laid down by Euclid or some other equivalent in extent and strictness, are precisely the advantages of accuracy over inaccuracy, and of real demonstration over a false and slovenly approximation to it, which, though a close resemblance, is therefore all the more dangerous. And it must be remembered what we mean by demonstration, namely, the process of obtaining a conclusion by sound logic from premises known to be true. If the prolixity of Euclid's method could be avoided by any assumption, we should not object, provided the assumptions were both true and easily seen to be true. For instance, if the theory of PARALLELS could be established without the difficulty by means of a hundred long and intricate propositions, we should agree with those who would refuse to place those propositions before beginners, on the ground that incomprehensible demonstration is already given, namely, an assumption which those who would rather dispense with it do not deny to be both true and easy (or capable of being made easy), and logic which is uncontested and incontestable. But the case of the system which is substituted for that of Euclid consists in the entrance of an assumption which is not true; for to reason upon all magnitudes as if they were commensurable, and to assert conclusions derived from such reasoning, is to assume that all magnitudes are commensurable, which is not true. The method of Lacroix, as above explained, is sound as far as it goes; he asserts that the propositions of geometry are sensibly true, or if false, imperceptibly false, and this he proves. But he makes geometry cease to be an exact science. That of Legendre, on the other hand, though it proves no more than that of Lacroix, professes to prove more: it treats geometry as an exact science, while it covertly states that an assumption may be made which is demonstrably incorrect.

We do not deny that a mind well versed in the doctrine of limits would have a process of its own, by which it would perceive the method of Lacroix, arguing as follows: The same process which show the propositions of geometry to have no error perceptible to our senses, would also show them to have no error perceptible to any imperfect senses, however near to perfection they might be; and that error which is less than any assignable error, must be no error at all. All this, when properly extended, we might admit; but how are we to suppose, in the student who has just left the fourth book of Euclid, a perception of the truths of the doctrine of limits, the notorious want of which creates the difficulties of the differential calculus? Sound teaching makes a true theory of proportion one, out of many previous steps, to the attainment of the differential calculus; but the inversion of the process not only adds difficulty to the latter, by interrupting proper illustration, but introduces falsehood into the former; and such teaching is the most vicious of all, among studies, because it propagates its kind.

The mathematical writers of this country have, taken all together, shown a superiority in exactness of demonstration over those of any other of modern times, and the deep and early root which the sound principles of Euclid have taken has been mainly the cause of this. If these principles be abandoned, that superiority will cease to exist; but this of itself would be of little consequence; not so the loss of a large amount of formation of accurate habits, which would certainly follow the substitution of a gross and (so called) practical instrument of education for an exact and liberal science.

Those to whom the mathematical sciences are taught as only to the power of distinguishing truth from falsehood, sense from fallacy, the exact consequence from all incorrect inference, very many times exceed in number those who only seek for an instrument to be used in the study of physics and the arts of life. If then practical mathematics mean those mathematics which best answer the purpose of the great majority of learners, the more they are rigorous the more they are practical. But the existing word *practical* has been otherwise appropriated; and 'exact enough for practical purposes' is the phrase applied to many a result of which the practical use belongs to the astronomer, mechanician, surveyor, engineer, or computer. To such a meaning of the word practical there is no objection as opposed to theoretical or disciplinary, where it is *knowledge* or *science* which is spoken of; but as applied to art, practical is opposed to impractical, which cannot be carried into practice, or unskilled, for that which cannot be practised in matters of art. But those who would consider the use of knowledge in strengthening the mind and making it a judge between the true and the false, and a safe guide in the methods of finding truth, must beware, in mathematics, how they allow the notions which are attached to the word practical any influence over their method of studying science. For want of such a caution many have missed all comprehension of the higher branches even of the art to which they aspired, to say nothing of the loss of that science to which it should seem they did not mean to aspire.

PROPORTION. Much of the beauty of architecture depends upon proportion, or, in other words, that well balanced regulation of the different parts of a structure which affects the eye and mind agreeably, all the members seeming agreeably adjusted to the whole, and the lesser details similarly adjusted to the separate features or larger members to which they belong. Accordingly great stress has been laid upon proportion by architectural writers, yet what they have said respecting it amounts to little more than artistical jargon; for not only do they generally restrict the term to proportion as regards individual parts, without reference to anything further, ascribing to them a positive charm, but some of them deny such merit altogether to any other styles than those of antient Greece and Rome and modern Italy. By proportion, in its technical sense, of course beauty of proportion is meant; yet it is surely a fundamental error to suppose, as some would have us do, that because what constitutes such beauty and such congruity of all the parts in the classical orders is not to be traced in the Gothic and other styles of the art, those latter can possess no corresponding beauty of their own. It would be about as rational to affirm that a horse has no proportions, or is an ill-proportioned misshapen animal, because its limbs are differently modelled and proportioned from those of a man.

What is it, if not the beautiful adjustment of parts to parts, that captivates us more or less in the productions of Gothic architecture? or wherefore do some buildings in that style charm us so much more than others, equally or even more meritorious perhaps in other respects, if not either by the harmony of their proportions, or the effect produced by some particular one, such for instance as loftiness, &c.? Indeed so very far from being devoid of proportions, Gothic architecture admits of infinitely greater variety in this respect than the columnar ordinance of the antients and moderns do; consequently, instead of being at all deficient in the elements and principles constituting proportion, it contains them in much greater abundance. It is indeed not the poverty but the copiousness of the Gothic, as regards diversity of proportions, that renders it almost impossible to systematize it, and to reduce it, as we have done the 'orders' (for we cannot say the *Grecian* and *Roman styles*), to a few positive rules which may be learned mechanically. So far it is beyond all comparison more difficult; and yet in one respect it seems conveniently easy, because conveniently accommodating, inasmuch as it affords very great latitude, and has no particular rules the infringement of which strikes at once as a solecism. Nevertheless this apparent facility is attended with some of the greatest difficulties, as is, unfortunately, too frequently made evident in our modern Gothic structures, which, even where the separate features or component parts are well proportioned in themselves, are rarely well put together, and agreeably proportioned upon the whole; or else, *vice versâ*, if the general proportions are good, those of the parts are not.

In respect to the Grecian orders [CIVIL ARCHITECTURE] and those derived from them, architecture has certainly not been benefited by the system-makers, who would establish certain fixed proportions for each, and thereby reduce each order to a single pattern for a column and its entablature. Neither is it easy to comprehend why such very great merit, or indeed any merit at all, should be ascribed to doing that which may be done altogether by rule, and without the slightest exercise of any mental faculty. Yet, though they insist upon the strictest regard to certain proportions, as far as the order, or the columns and entablature alone, of a building are concerned, they make amends for such rigour by liberally tolerating the utmost laxity as to proportion in all other respects. Provided the order be of legitimate proportions in itself, it may be quite out of proportion to the whole of the structure, and every other part may be out of proportion to the columns: either large windows may be introduced between diminutive columns, and consequently placed at considerable intervals from each other; or else two or even more tiers of diminutive windows may be placed between huge columns running through several stories, without offending the criticism that would be absolutely shocked at meeting with columns half a diameter more or less in height than the fixed standard, no matter what reason there might be for deviating from it, nor how judiciously soever it might be done.

Were the orders and their proportions so absolutely and unconditionally beautiful in themselves, as has been contended, many modern buildings ought to produce a very different effect from what they actually do. We find too that buildings of the same order are totally different in their proportions and in the relation which their other parts bear to the columns and entablatures. The only kind of proportions in regard to which positive directions can be laid down, and which are therefore prepared for all alike without other study than that included in the usual course of elementary instructions, are those which relate to columns, doors, windows, niches, &c. For all these, certain relations between height and breadth have been established, originating in convenience and fitness, and not in any abstract notions of geometrical harmony or beauty. Were the latter the case, the square and equilateral triangle would recommend themselves as the most perfect forms, the one for windows, the other for pediments. This is so far from being the case, that no kind of square apertures are admissible, or capable of being rendered agreeable even where dictated by convenience, except for mezzanine windows, for if a window requires to be made of wide proportions, so as to approach a square, it must be divided into separate upright compartments or apertures, after the manner of what is called a Venetian window; otherwise, even although its dimensions should not be such as to render a single aperture inconvenient, it would produce a disagreeable effect, and look like a mere glazed gap, or as a Gothic window of wide proportions would do without its mullions. With regard to arches again, or rather the spaces or openings covered by them, the proportions that are pleasing in some cases are quite unsuitable for others: in spacious apertures of the kind, that is, of considerable breadth as regards the other features, the proportions ought to vary little from a double square in height, or two circles inscribed within the aperture, of which half of the uppermost one will be the outline of the arch; whereas in narrower apertures of the kind, and in arched windows, greater proportionate height is allowable. As in almost every other respect, Gothic architecture affords greater freedom and latitude, not only as regards the form of the arch itself, but also the general proportions of the entire *voiding* covered by it, which may be of lofty proportions in comparison with its breadth; but in the Roman or modern Greco-Roman style (where the arch is adopted together with the Grecian features and detail), other proportions than those above mentioned cannot very well be departed from, because the excess as to height which would produce the grandeur of loftiness would in the same degree occasion the effect of narrowness, narrow and lofty being almost convertible terms as regards proportion. There are cases in which propriety and fitness not only reconcile us to proportions that would else be positively disagreeable, but in which positive admiration is excited by what would in general be termed utter disproportion. Of this we have proof in bridges, where beauty and grandeur are occasioned by proportions that would be absolutely monstrous elsewhere, by arches of prodigious span or width, springing from exceedingly low piers.

As to the internal proportions of buildings, we shall only observe that beauty and harmony of proportions depend very much upon the particular purpose for which an apartment is intended, and also upon the particular character aimed at. Even loftiness and lowness of proportion are not necessarily either a merit or defect, as their being so depends in very great measure not only on the nature of the apartment itself, but also on the architectural treatment of it. Whether in interior or exterior design, it is requisite that the individual features should be not only well proportioned in themselves, but so well balanced and adjusted that the ensemble shall at once produce a pleasing impression upon the spectator; which kind of *eurythmia*, or general harmony of proportions, admits of so many modifications, and depends so greatly upon the precise nature and character of the particular design, that direct precepts avail but little towards its attainment, on which account it must be acquired chiefly by taste guided by study and observation.

PROPORTION, in Music, is either Harmonical or Rhythmical.

Harmonical Proportion is when, of three numbers representing the relations of sounds, the first has the same proportion to the third as the difference between the first and second has to the difference between the second and third; as in the numbers 6, 8, 12; where

$$6 : 12 :: 8-6 : 12-8;$$

that is to say, $6 : 12 :: 2 : 4$.

When four numbers are in Harmonical Proportion, then the first has the same proportion to the fourth as the difference between the first and second has to the difference between the third and fourth; as in the numbers 6, 8, 12, 18; where

$$6 : 18 :: 8-6 : 18-12;$$

that is to say, $6 : 18 :: 2 : 6$.

The proportions of the sounds of the diatonic scale [DIATONIC] are as follows:—

The Key-note	1 : 1
2nd	9 : 8
3rd (major)	5 : 4
4th	4 : 3
5th	3 : 2
6th	5 : 3
7th	15 : 8
8th, or octave	2 : 1

[SCALE; ACOUSTICS.]

Rhythmical Proportion is the proportion, in relation to time or measure, between the notes representing duration. Thus, the semibreve to the minim is 2 : 1; the semibreve to the crotchet, 4 : 1; the minim to the semiquaver, 8 : 1, &c. That is, the semibreve is twice as long in time as the minim; four times as long as the crotchet, &c.

PROPORTIONAL COMPASSES. [COMPASSES.]

PROPORTIONAL LOGARITHMS, also called logistic logarithms. Suppose it frequently required to calculate the fourth term of a proportion of which the first term is one given quantity, say A: that is, required a fourth proportional to A, p, and q. Common logarithmic calculation here requires three inspections of the table, one addition, and one subtraction. But if A be always the same thing, a new table may be framed, which shall only require two inspections and one addition, as follows:—Opposite to p in the table, write log A—log p instead of log p, and call the former the proportional logarithm of p, which must be considered as the abbreviation of 'logarithm of p proper to be used in proportions of which the first term is A.' The rule then is;—to find a fourth proportional to A, p, and q, add the proportional log. of p to that of q, and the sum is the prop. log. of the answer. For log A – log p, and log A – log q, added together, give

$$\log A - \log \frac{pq}{A};$$

which is, by definition, the prop. log of $pq \div A$, the answer required.

In tables made to be used with the old Nautical Almanac in which the moon's motion was given for every three hours, A was made $= 3^h = 10800^s$; and p and q were given in the table, not in seconds, but reduced to hours, minutes, and seconds. Thus the question—

$$3^h : 1^h\ 23^m\ 18^s :: 14^m\ 13^s : x,$$

could be answered, and x found, by two inspections and an addition. But the convenience of this table lay much more in the arrangement into hours, minutes, and seconds, than in the nature of the substitute for the logarithm: and since a similar arrangement is now made to accompany common tables of logarithms, it may be doubted whether the day of logistic logarithms is not past.

PROPORTIONAL PARTS, a name given in logarithmic and other tables to small tables which are annexed to the differences of the tabular number, and which consist merely in setting down the several tenths of the differences, or the nearest whole numbers to them. Thus, in the case of 953, the table of proportional parts is as follows:—

953	
1	95
2	191
3	286
4	381
5	477
6	572
7	667
8	762
9	858

Thus 286 is the whole number nearest to 3 tenths of 953; from which we infer that 29 is the whole number nearest to 3 hundredths of 953. If then we would have ·74 of 953 to the nearest whole number, we take

7 tenths	.	667
4 hundredths	.	38
		705

or 705 is the nearest whole number required, subject to the possibility of an error of a unit, which is of no consequence in the matters for which such tables are used. This is the process required in logarithmic interpolation, when tables of seven decimal places are used.

PROPORTIONS, DEFINITE. [Atomic Theory.]

PROPOSITION. [Organon.]

PROPYLÆA. [Civil Architecture.]

PROROGATION. [Parliament, p. 471.]

PROSE comprehends any species of composition which is not written in metre. Modern writers have differed much respecting what constitutes the distinction between prose and poetry. Many writers maintain that the whole class of compositions, which have pleasure for their main object, ought to be regarded as poetry; but Whately, on the other hand, contends that metre is the essence of poetry, and consequently defines poetry as 'elegant and decorated language, in metre, expressing such and such thoughts,' and good prose-composition 'such and such thoughts expressed in good language' (*Rhetoric*, p. 249). [Poetry.]

PROSELYTE (προσήλυτος, connected with προσέρχομαι, *to come to*), *a new comer*. This word is not found in classical Greek, but occurs many times in the Septuagint, and a few times in the New Testament. It answers to the Hebrew, גֵּר, *a stranger*. 'Proselytes,' says Suidas, 'are they who have come out of the Gentiles, and live according to the divine laws.' The word is applied almost exclusively to persons converted to the religion of the Jews. Of proselytes, two kinds are mentioned by Jewish writers, proselytes of the gate, who observed only a few prescribed rules, and proselytes of righteousness, who followed the entire Mosaic ritual; but such a distinction does not appear to be recognised in the Scriptures. (Joseph Mede's *Dissertations*.)

PROSE'RPINA, called by the Greeks Persephone (Περσεφόνη) and Persephoneia (Περσεφόνεια), was the daughter of Zeus and Demeter (Hesiod, *Theog.*, 913.) She was carried off by Pluto while gathering flowers in the Nysian plain (Homer, *Hymn in Demet.*, 17), and made the queen of the regions of the dead. Demeter, inconsolable for the loss of her daughter, afflicted the world with sterility; till at length Zeus consented to the return of Proserpine to her mother; but as she had eaten food in the regions below, she was obliged to spend one third of the year with Pluto, and was allowed to pass the other two-thirds with Demeter. The tale of the rape of Proserpina is related at length in the Homeric Hymn to Demeter, and by Ovid and Claudian. The last two writers state that Proserpina was gathering flowers near the city of Enna in Sicily, when she was carried off by Pluto. In Homer, Persephone is mentioned as the goddess of Hades (*Od.*, xi. 217); but her rape by Pluto is not mentioned either in the 'Iliad' or 'Odyssey.'

Proserpina is frequently called Kora (Κόρη), that is, the 'Maiden,' by the Attic writers. This goddess and her mother Demeter were also worshipped under the name of the 'Great Goddesses' (αἱ μεγάλαι θεαί, Pausan., viii. 31, § 1).

The etymology of Persephone and Proserpina is doubtful. Some writers connect her name with φέρω, *ferre*, 'to bring,' and φαίνω, *facio*, 'to show,' and interpret it to mean the 'bringer of seed,' in allusion to her being the daughter of Demeter; but this explanation is far from satisfactory. [Demeter; Pluto.]

PROSI'MIA, the name given by Brisson and Storr to some of the *Lemurs*. [Lemuridæ.] The *Prosimii* of Illiger (belonging to his *Pollicata*) contained the genera *Lichanotus*, *Lemur*, and *Stenops*.

PROSODY (προσῳδία) is derived from a Greek word, which has exactly the same meaning as the Latin *accentus*, and was used by the Greeks in the same sense. (Quintil., *Inst. Orator.*, i. 5, p. 29, ed. Bipont.; Aulus Gellius, xiii. 6.) Most modern writers however make a distinction between prosody and accent, understanding by the former what is usually called *quantity*, that is, the duration of a sound. Thus it is said that the principle of Greek and Roman versification is *quantity*, while that of the poetry of the modern European languages depends on *accent*. It is not however improbable that what the antients meant by *quantity* was not very different from what we call *accent*. [Accent.] For further information on this subject the reader is referred to an able article in the fourth volume of the 'Journal of Education,' p. 217, &c.; and to the article Oratory.

PROSOPIS, a name which occurs in Dioscorides, and which has been injudiciously applied to a tropical genus, without any proof of the species of this, having any resemblance to the original plant. The genus consists of trees or shrubs, with flowers in spikes, pinnate much-divided leaves, with or without thorns, and edible legumes, of which several are found in South America, and called algaroba by the Spaniards. One species is found in India, which resembles the South American species in its legume, when ripe, containing, besides the seeds, a large quantity of a brown mealy substance which is eaten by the natives of the country. This species, known to the natives by the name of Chamie, grows to the size of a tree, and is found in the interior of the peninsula of India, as well as in the north-western provinces. It was referred to Adenanthera by Dr. Roxburgh. The genus is characterised by having polygamous flowers, a five-toothed calyx, five free petals, ten stamens with the filaments scarcely united at the very base. Legume continuous, filled with pulp, linear, cylindrical, slightly compressed, torulose, at length crumbling to pieces. It is the above pulp which is edible both in India and in South America.

PROSTYLE. [Civil Architecture.]

PROTA'GORAS was born at Abdera in Thrace, and is said to have been originally a porter, and to have received instruction from Democritus, who was so pleased with the skilful manner in which Protagoras arranged his load, that he afforded him the means of prosecuting the study of philosophy. Some modern writers have disbelieved the whole account, but it seems certain, from the unanimous testimony of the antients, that Protagoras was of an inferior condition in life, and owed his education to Democritus. (Aul. Gell., v. 3; Diog. Laert., ix. 50, 53; Athenæus, viii., p. 354, c.; Suidas, &c.) The principal circumstance which has led some writers to doubt whether Protagoras ever received instruction from Democritus arises from the fact that the former was in all probability older than the latter. Democritus was born B.C. 460. [Democritus.] Plato represents Socrates in the 'Meno' (c. 29, p. 91) speaking of Protagoras as already dead, and also states that he lived nearly seventy years. Now as Socrates died B.C. 399, Protagoras, according to this account, must have been born at least as early as B.C. 470, though the carelessness of Plato on such subjects renders this by no means certain. Philochorus however, according to Diogenes Laertius (ix. 55), said that the death of Protagoras was alluded to in the 'Ixion' of Euripides, which must consequently have happened before that of Euripides, that is, before the end of B.C. 406. If however both these statements can be depended upon, there is still no reason for disbelieving that Protagoras received instruction from Democritus; for, as Mr. Clinton has remarked, Democritus, who belonged to one of the most eminent families at Abdera in rank and station, might discern the merit and encourage the genius of Protagoras, although younger himself than Protagoras.

None of the writings of Protagoras have come down to us; but it is evident that he was a man of great powers of mind. Some of his doctrines are discussed in the 'Theætetus' of Plato. [Plato, p. 237.] He travelled through Greece for the purpose of giving instruction in philosophy and eloquence, and is said to have been the first person who adopted the name of Sophist (σοφιστής), to distinguish more decidedly one who made others wise, especially one who taught eloquence and the political art. He is also said to have been the first among the Greek philosophers who received money for the instruction which he gave. Wherever he went, he was sure to obtain numbers of pupils; and Plato, in the dialogue entitled 'Protagoras,' has given an amusing account of the enthusiasm with which he was received by the young men at Athens on his visit to that city. Diogenes Laertius says (ix. 52) that his instruction was so much in demand, that he sometimes received a hundred minæ; and Plato informs us (*Meno*, c. 29, p. 91) that, during the forty years in which Protagoras taught, he made more money than Phidias and ten other sculptors.

Protagoras visited Athens at least twice. Two of his visits are spoken of by Athenæus and Plato (Athen., v., p. 218, b; xi., p. 506, a; *Protag.*, c. 5), and the date of his second visit is determined by the former writer, who says (v., p. 218, c) that it took place after the Κόννος of Ameipsias and before the Κόλακες of Eupolis, that is, between B.C. 423 and 421. During one of his visits to Athens, probably subsequent to those which have been mentioned, he was banished from the state, and his books burned in the market-place, because he had stated at the beginning of one of his works that he did not know whether the gods existed or not. (Diog. Laert., ix. 51, 52; Cic., *De Nat. Deor.*, i. 23.) According to some accounts, he was drowned in his passage to Sicily, and, according to others, died on the voyage. (Diog. Laert., ix. 55.)

Protagoras appears to have been the first who taught oratory as an art. He possessed, if we may judge from the specimen given by Plato in the 'Protagoras,' a lively imagination and great copiousness of words. He was well acquainted with the literature of his own country, especially the works of the antient poets, whom he frequently quoted in his speeches, which appear to have been very popular. He is said to have taught Isocrates, and his oratorical exercises are referred to by Cicero, who says that they were called in his time 'communes loci' (*Brut.*, c. 12). Protagoras was the first who introduced artificial divisions into discourses. (Diog. Laert., ix. 53, 54.) He also appears to have written works on language and oratory: his ὀρθοέπεια, which is referred to by Plato (*Phædr.*, c. 114, p. 267), is supposed by Spengel (Συναγωγὴ τεχνῶν, p. 40, Stuttgardt, 1828) to have been a work of this description. A list of the writings of Protagoras is given by Diogenes Laertius (ix. 55) and Fabricius (*Bibl. Græc.*, vol. ii., p. 668, ed. Harles). Cicero refers to his work 'On the Nature of Things' (*De Orat.*, iii. 32).

For further information on the Life of Protagoras, the reader is referred to Herbst, *Des Protagoras Leben und Sophistik aus den Quellen zusammengestellt*, in Petersen's 'Phil.-Histor. Studien auf dem Akad. Gymnasium in Hamburg,' Hamburg, 1832, heft i., p. 88.

PROTEA'CEÆ. [XYLOMELUM.]

PROTECTOR. [SETTLEMENT.]

PROTELES. [AARD-WOLF.]

PROTEOSAU'RUS. [ICHTHYOSAURUS.]

PROTEST. [BILL OF EXCHANGE; NOTARY; PARLIAMENT.]

PROTESTANT, a general term comprehending all those who, professing Christianity, yet are not in the communion of the general church or confederacy of Christians of which the pope is the head and the city of Rome the centre or capital. There is great variety of opinion among persons thus separated, in points of faith, church order, and discipline, but this term covers and comprehends them all, leaving the varieties in opinion to be marks of specific differences only under the genus Protestant.

The term originated in Germany, and the occasion was this:—At the diet at Spire, in 1526, decrees had been passed which were so far favourable to the progress of the Reformation that they went to forbid any peculiar exertions against it. The consequence was that the spirit of reformation gained strength, and spread itself more extensively in Germany. Then arose also commotions which were attributed to the reformed and to the spirit kindled by them. Both the pope and the emperor looked with increasing alarm on the aspect of affairs, and at another diet, held at the same place in 1529, the emperor directed an imperial brief to the persons assembled, to the effect that he had forbidden all innovation, and proscribed the innovators in matters of religion, who had notwithstanding increased since the decrees of 1526, but that now, by virtue of the full powers inherent in him, he annulled those decrees as contrary to his intentions. The peremptory tone of these letters alarmed the persons present at the diet; and particularly the elect[illegible] of Saxony is reported to have said to his son that no form[illegible] emperor had used such language, and that he ought to be informed that their rights were more antient than the el[illegible]vation of his family.

This strong measure of the emperor had also the effect [illegible] uniting, at least on this point, the two great sections [illegible] German reformers, the Lutherans and the Sacramentarian[illegible], of whom Zuinglius was the head. However the pa[illegible] opposed to the Reformation was the stronger, and the emperor's brief received the sanction of the diet. Then it w[illegible] that the reformers took the high ground of declaring th[illegible] this was not a business of policy or temporal interests, w[illegible] respect to which they were ready to submit to the will [illegible] the majority, but it affected the interests of conscience a[illegible] futurity. On this and other grounds they founded a *pr[illegible] test*, which was delivered in on the 19th day of April, b[illegible] refused by the rest of the diet. A second protest, lar[illegible] than the former, was presented on the succeeding day. The princes and the cities who favoured the Reformation join[illegible] in it, and thenceforth it became usual to call the reform[illegible] *Protestants*.

It is often found that a particular incident or occasion lea[illegible] to the construction of a name for a religious party, which b[illegible]comes extended, as in this instance, to parties who have [illegible] immediate connection with the particular incident, or int[illegible]rest in the question with which it is connected. The ter[illegible] Protestant in fact seems to have as much to do with t[illegible] constitution of the Germanic confederacy as with the prin[illegible]ciples of the Reformation; and certainly neither Englan[illegible] nor Scotland had any thing to do with the proceeding[illegible] the emperor or with the diet of Spire. The Reform[illegible] Church might seem to designate the church of England [illegible] the church of Scotland more appropriately than the Pr[illegible]testant church. However it must be owned that f[illegible] things are more difficult than to coin terms by which to [illegible]signate a religious community which shall not be ope[illegible] objection and cavil.

PROTEUS, Laurenti's name for one of the genera [illegible] *Perennibranchiate Batrachians*, namely, those *Batrachia[illegible]* which preserve their branchiæ throughout life, wherea[illegible] *Caducibranchiate Batrachians* only possess them dur[illegible] their early or tadpole state. [FROGS.] This preservat[illegible] of the branchiæ does not interfere with the presence of tr[illegible] lungs, so that these *Perennibranchiata* may, as Cuvier o[illegible]serves, be regarded as the sole vertebrated animals that a[illegible] truly amphibious. The same distinguished comparati[illegible] anatomist says: 'The simultaneous existence and action [illegible] branchial tufts and lungs in these animals can no more [illegible] contested than the most certain facts of natural histor[illegible] I have before me the lungs of a *Siren* of three feet in len[illegible] where the vascular apparatus is as much developed and [illegible] complicated as in any reptile: nevertheless this *Siren* h[illegible] its *branchiæ* as complete as the others.' [SIREN.] Cuv[illegible] further observes that whilst the branchiæ subsist, the a[illegible] in coming from the heart, is divided into as many branch[illegible] on each side as there are *branchiæ*. The blood of th[illegible] *branchiæ* returns by the veins, which unite towards t[illegible] back in a single arterial trunk, as in the fishes; it is fr[illegible] this trunk, or immediately from the veins which form [illegible] that the greatest part of the arteries which nourish t[illegible] body, and even those which conduct the blood for re[illegible]tion in the lung, spring. But in the species which lose the[illegible] *branchiæ* naturally, the branches which go there bec[illegible] obliterated, except two which unite in a dorsal artery, a[illegible] of which each gives off a small branch to the lung. 'It [illegible] adds Cuvier, 'the circulation of a fish metamorphosed i[illegible] the circulation of a reptile.'

The genera of these *Amphibia*, or *Proteidea*, as they h[illegible] been termed, are the *Axolotls* [AXOLOTL]; *Menobranch[illegible]* Harlan [NECTURUS]; *Proteus*, of which we are abou[illegible] treat; and *Siren* which will be noticed under that title.

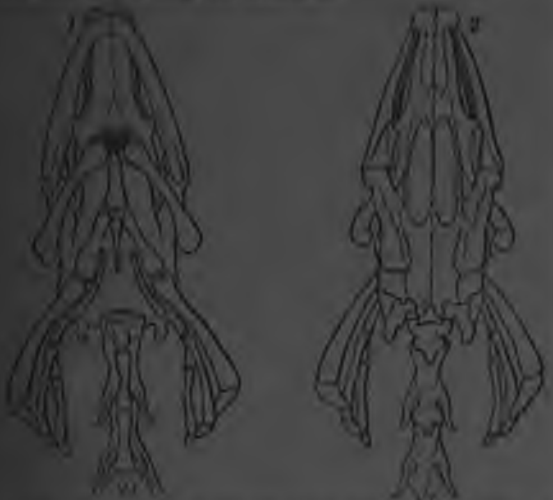
ORGANIZATION.

The *Proteus* of Laurenti (*Hypochton* of Merrem) has f[illegible] feet. There are three toes on the anterior feet and two [illegible] on the posterior feet. The skeleton bears considerab[illegible] semblance to that of the *Salamanders*; indeed, Cuvier[illegible] believe, has somewhere termed the fossil *Salaman[illegible] gantea*, the *Homo diluvii testis* of Scheuchzer, *[illegible] gigantesque*: but *Proteus* has many more vertebræ [illegible] the Salamanders, and less of the rudiments of ribs, an[illegible]

[illegible] head is entirely different from those in its general conformation.

But one species of *Proteus* appears to be known, the *Proteus anguinus* of authors, *Hypochton Anguinus*. Cuvier describes it as more than a foot long, of the size of a [illegible] finger, with a tail vertically compressed, and four little legs; the muzzle elongated and depressed; both of its jaws furnished with teeth;[*] the tongue with but little [illegible], but free in front; the eyes excessively small and hidden by the skin, as in the Rat-Mole (*Spalax*); the ears covered by the flesh, as in the Salamander; its skin smooth and [illegible].

Those which we have seen alive have been of a light flesh-colour, with coral-red branchiæ.



1, Skull, &c., and [illegible] first vertebræ, of the Proteus, seen from below. 2, Same seen from above, eight times larger than nature. (Rusconi.)

16 November, 1837, Dr. Martin Barry, of Edinburgh, exhibited one of these singular and interesting animals, living, to the Zoological Society of London, and read the following communication from Professor Rudolph Wagner, of Erlangen in Bavaria:—

'I was so fortunate'—it is the Professor who speaks—'at the end of last summer, as to obtain three living *Protei*; of which I have examined two, just killed, that proved to be a male and female, and have given the third, alive, to my friend Dr. Barry, who may perhaps have an opportunity of bringing it forward at a meeting of the Zoological Society. The results of my examination correspond perfectly with the statements of Cuvier, R. Owen, J. Müller, and others, on the *Proteidea*; but are opposed to several of the views lately put forth by Rusconi. (*Observations sur la Sirène*, [illegible].) I have for instance, no doubt that the pulmonary sacs or vesicles really perform the function of lungs. Each lung contains a large artery and a still larger vein, which are connected together by means of large and numerous vessels. To me the most important point was the examination of the blood-globules and the generative organs. I conjectured, on various grounds, that the *Proteidea* would be found to have, of all animals, the largest blood-globules: first, because the size of the latter in the naked *Amphibia* in general is the largest in the animal kingdom; secondly, because, remarkable as it is, the blood-globules are [illegible] (in the naked Amphibia) so much the larger, the longer the gills continue in the larval state; hence the land and water salamanders have much larger blood-globules than the frog. I conjectured also that the *Protei* (probably also the *Siren*, &c.), because they permanently have both gills and lungs—being therefore permanently larvæ—would be found to have the largest blood-globules. The latter are [illegible]: flat, oval, resembling those of the salamander, and from $\frac{1}{?}$ to $\frac{1}{?}$ of a Paris line in length; hence, [illegible] visible to the naked eye. They are from [illegible] the size of the blood globules of the salamander, nearly three times as large as those of the frog, and [illegible] twelve or fifteen times the size of those of man. In the female I found the ova very beautifully developed; their [illegible], as well as that of the ovary, corresponding perfectly with that of the other naked *Amphibia*, especially the *Tritons*. The smallest ova consist of a delicate chorion, yellow yolk, large germinal vesicle, and [illegible] germinal spot. I regret to say that in the otherwise tolerably developed testes of the male there were no spermatozoa. I conjecture however that the spermatozoa of this animal resemble those of the *Triton*. I would just remark, that the form and size of the blood-globules, the formation of the ova, and the form of the spermatozoa, in different animals,

[*] [illegible] (Classification of Amphibians) [illegible] and Professor Owen's work on the teeth, [illegible]

have a great zoological and physiological interest. Already is it in my power from a drop of blood or *semen* placed before me, to determine with the microscope, not only the class, but frequently the genus and the species from which these fluids have been taken.'

Dr. Barry then stated that, from his own microscopical examination, he was able fully to confirm the correctness of Professor Wagner's observations upon the size and shape of the blood-globules in the *Proteus*. (*Zool. Proc.*, 1837.)

Locality, Habits, &c.—Sir Humphry Davy, in his 'Consolations in Travel,' gives a very graphic account of finding these subterranean aquatics in Illyria. In a conversation given as taking place in the Grotto of the Maddalena at Adelsberg, many hundred feet below the surface, after a lively description of that extraordinary cavern, *Eubathes*, one of the prolocutors, says, 'I see three or four creatures, like slender fish, moving on the mud below the water.'

'*The Unknown.*—I see them; they are the *Protei;* now I have them in my fishing-net, and now they are safe in the pitcher of water. At first view, you might suppose this animal to be a lizard, but it has the motions of a fish. Its head and the lower part of its body and its tail bear a strong resemblance to those of the eel; but it has no fins,* and its curious branchial organs are not like the gills of fishes; they form a singular vascular structure, as you see, almost like a crest, round the throat, which may be removed without occasioning the death of the animal, which is likewise furnished with lungs. With this double apparatus for supplying air to the blood, it can live either below or above the surface of the water. Its fore feet resemble hands, but they have only three claws or fingers, and are too feeble to be of use in grasping or supporting the weight of the animal; the hinder feet have only two claws or toes, and in the larger specimens are found so imperfect as to be almost obliterated. It has small points in place of eyes, as if to preserve the analogy of nature. It is of a fleshy whiteness and transparency in its natural state, but when exposed to light, its skin gradually becomes darker, and at last gains an olive tint. Its nasal organs appear large; and it is abundantly furnished with teeth, from which it may be concluded that it is an animal of prey; yet in its confined state, it has never been known to eat, and it has been kept alive for many years by occasionally changing the water in which it was placed.'

Eubathes.—'Is this the only place in Carniola where these animals are found?'

The Unknown.—'They were first discovered here by the late Baron Zöis; but they have since been found, though rarely, at Sittich, about thirty miles distant, thrown up by water from a subterraneous cavity; and I have lately heard it reported that some individuals of the same species have been recognised in the calcareous strata in Sicily.'

Eubathes.—'This lake in which we have seen these animals is a very small one; do you suppose they are bred here?'

The Unknown.—'Certainly not; in dry seasons they are seldom found here, but after great rains they are often abundant. I think it cannot be doubted that their natural residence is in an extensive deep subterranean lake, from which in great floods they sometimes are forced through the crevices of the rocks into this place where they are found; and it does not appear to me impossible, when the peculiar nature of the country in which we are is considered, that the same great cavity may furnish the individuals which have been found at Adelsberg and at Sittich.'

Eubathes replies, 'That this is a very extraordinary view of the subject, and proceeds to inquire whether it is not possible that it may be the larva of some large unknown animal inhabiting those limestone cavities?'—which ingenious theory the *Unknown* very properly disposes of by showing that it is not an animal in a state of transition, but a perfect animal of a peculiar species.

Proteus anguinus.

With reference to the subject of this article, the student should carefully go over Professor Owen's paper on the *Lepidosiren annectens*, in the eighteenth volume of the 'Linnean Transactions.' This most interesting animal, though undoubtedly a fish, is one of those beautifully fine and harmonious links by which the whole golden chain of nature is connected. We direct attention to one or two points in the structure of this *Proteideous* fish. In *Lepidosiren* the nostrils are situated at the under part of the upper lip, within the opening of the mouth. They appear as two small perforations leading to blind sacs. In the *Siren*, as well as in the *Proteus*, Cuvier expressly states that the nasal cavities communicate with the mouth.

The muscles of the trunk of the *Lepidosiren* present, Mr. Owen tells us, all the simplicity and uniformity characteristic of the class of fishes; the ventral series occupy the place of the true abdominal muscles, which first begin to be developed in the strictly air-breathing Reptiles. The muscles of the mandibular, hyoidean, branchial, and scapular arches resemble in some points the arrangement of the same muscles in the Perennibranchians, and in other points that in the true fishes; and, notwithstanding the entirely fish-like disposition of the muscles of the trunk, the lower Perennibranchians and the larvæ of the higher Batrachians offer, he observes, a similar agreement in this part of their organization to the class of fishes. Again, we are told that the brain bears a closer resemblance to that of the Perennibranchiate Reptiles than to the brain of any fish that has yet been described. In the low development of the cerebellum and in the large size of the pineal gland, the *Lepidosiren* deviates remarkably, both from the osseous and cartilaginous fishes. The orifice of the pharynx is much smaller and more suddenly contracted than in fishes generally, or the Perennibranchiate Reptiles. The abdominal cavity, which commences about half an inch behind the pectoral filamentary fins, and extends about half an inch beyond the anus, is separated anteriorly from the pericardiac cavity, as in fishes and Perennibranchiate Reptiles, by a distinct transverse septum. The heart of *Lepidosiren* consists of a single auricle, a ventricle, and a *bulbus arteriosus*. The *vena cava* terminates in the right side of the large auricle; it is joined by two superior *cavæ*, and by the single large pulmonary vein; this vein does not however communicate with the sinus, but passes along entire and adherent to the inner surface of the *vena cava*, as far as the auriculo-ventricular aperture, where it empties its contents into the ventricle by a distinct orifice, protected by a cartilaginous valvular tubercle. 'It needed only,' proceeds Mr. Owen, 'that the pulmonary vein should have been dilated before its termination, in order to have established a biauricular structure of the heart, as in the *Siren*. The same functional advantage is however thus secured to the *Lepidosiren*, with the maintenance of the simple dicœlous type of the heart of the fish; the continuation of the pulmonary vein preventing the admixture of the respired with the venous blood, until both have arrived in the ventricle.' The *branchiæ* of the *Lepidosiren*, it appears, resemble in form those of the *Siren*, consisting of separate elongated filaments, attached only by one extremity to the branchial arch; but these extremities are fixed directly to the branchial arch, and not to a common pedicle extended therefrom, as in the *Siren*. Viewed with a moderate lens, Professor Owen found the tripinnatifid structure beautifully displayed in each branchial filament. The gills do not form any external projection, as in the gill-bearing Perennibranchians; but although the organs for respiration through the medium of water correspond in all essential points with those of the true fishes, yet the gills approximate in their filamentary form to those of the Perennibranchiate Reptiles. The tra-

* It has a sort of tail fin.

and the *Ceratodus pinnacalis*, is a short, wide, membranous wing, as in the Perennibranchiate Reptiles, and those are not yet large, but having the same relative position as the ventral fins of fishes.

Our limits will not permit us to go further into this interesting comparison; but we particularly recommend attention to the concluding observations of the Professor's acute, accurate, and satisfactory memoir. [Perennibranchiata.]

PROTOSAURUS. [Saurians, Fossil.]

PROTO'GENES (Πρωτογένης), one of the most celebrated of the Greek painters, was born at Caunus in Caria, a town subject to the Rhodians. Suidas says that Protogenes was a native of Xanthus in Lycia; but this appears to be a mistake, since he is called a Caunian by Pausanias (i. 3, § 4), and is expressly said by Pliny (*Hist. Nat.*, xxxv. 36, § 20) to have been born at Caunus. He was a contemporary of Apelles, and was at the height of his reputation in the 112th Olympiad, that is, about B.C. 332. (Plin., *Hist. Nat.*, xxxv. 36, § 19.) He lived at Rhodes during the greater part of his life.

Pliny says that Protogenes was originally in very poor circumstances, and that it was not known from whom he received instruction. He did not produce many paintings, in consequence of the long time and great labour which he devoted to each. Quintilian (*Inst. Orat.*, xii. 10, p. 309, Bipont) says that 'cura' was the distinguishing characteristic of his paintings; and Apelles is said to have remarked that Protogenes did not know when to take his hand from his pictures. (Plin., *Hist. Nat.*, xxxv. 36, § 10.) Of all the paintings of Protogenes the most celebrated was the one called Ialysus, upon which he is said to have been engaged seven years. (Ælian, *Var. Hist.*, xii. 41.) Pliny says that he lived, during the time he was painting it, upon moistened lupines, and also informs us that each colour was laid on four times. A dog in this painting, which was represented panting and foaming at the mouth, was greatly admired. It is related that Protogenes was for a long time unable to represent the foam in the manner which he wished, till at length, disheartened by repeated failures, he threw his sponge at the mouth of the dog, which accidentally produced the effect he had been endeavouring to obtain. The fame of this painting was so great, that Demetrius Poliorcetes, when besieging Rhodes, did not set fire to that part of the city where Protogenes lived, lest he should destroy this picture. (Plin., *Hist. Nat.*, vii. 39; xxxv. 36, § 20.) Aulus Gellius, in relating the same circumstance, says (xv. 31) that Protogenes was dead, and that the painting was preserved in a public library outside the walls of the town. In the time of Pliny it was preserved in the temple of Peace at Rome.

Among the other paintings of Protogenes mentioned by Pliny was a portrait of the mother of Aristotle, who advised him to paint some of the exploits of Alexander the Great. Paintings of Alexander and of Pan were among the last of his works. Pausanias (i. 3, § 4) also mentions a painting of the Thesmothetæ by Protogenes, which was preserved at Athens in the senate-house of the Five Hundred (βουλευτήριον).

Protogenes is always mentioned by the ancient writers in terms of the highest admiration. (Petron., *Sat.*, c. 83; Cic., *Brut.*, 18; *ad Att.*, ii. 21; Varro, *De Ling. Lat.*, ix. 12, ed. Müller; Columella, *De Re Rust.*, i. *Præf.*; iii. lib. i., p. 21, Bipont.) He is said by Pliny to have also executed works in bronze.

Suidas says that Protogenes wrote two books on the art of painting and on figures (περὶ γραφικῆς καὶ σχημάτων).

(Junius, *Catalogus Architectorum, Mechanicorum, Pictorum*, &c., s.v. 'Protogenes,' Rotterd., 1694.)

PROTOPTERUS. Under this name Professor Owen, in the MS. catalogue of the Museum of the College of Surgeons, in June, 1837, recorded the principal characters of an extraordinary animal which he supposed to belong to the Malacopterygious fishes. In the same year, Dr. Natterer published an account of a nearly allied animal under the name *Lepidosiren paradoxa*. This account appeared in the 'Annals of the Museum of Vienna,'* and is drawn up from two specimens discovered by the author of the paper in South America. The memoir of Dr. Natterer on the South American *Lepidosiren* was followed by one from Professor Owen, in the 'Linnean Transactions' (vol. xviii., part 2, p. 327), in which that anatomist describes in detail both the external characters and internal anatomy of the *Protopterus* above mentioned; and as he found this animal must be referred to the same genus as that discovered by Dr. Natterer, he adopted his generic term, and applied the name of *Lepidosiren annectens* to the species. 'The last-mentioned animal,' says Professor Owen, 'was presented to the Royal College of Surgeons, June, 1837, by Thomas C. H. Weir, Esq., together with a smaller dried specimen, enclosed in indurated clay baked hard by the sun. Several species of insects peculiar to the Gambia, or African forms, accompanied these specimens.' 'It is a female, with the ovaria well developed, and measures twelve inches eight lines in length; its greatest circumference is four inches and a half. The head commences by an obtuse muzzle, and gradually enlarges in all its dimensions to the gill-openings, which are situated immediately anterior to the base of the pectoral extremities: the length of the head, from the snout to the gill-opening, is one inch eleven lines. The anus, or rather the cloacal vent, is a small elliptical aperture marked with radiating lines, which is situated three lines behind the ventral filaments, and offers the same peculiarity as does that of the *Lepidosiren paradoxa* in not being situated on the median plane; in the present specimen it was on the right side of a longitudinal fold of integument which occupied the middle line. The distance from the vent to the end of the tail is five inches. The trunk gives a wide elliptical transverse section, and maintains a pretty uniform size, slightly decreasing in breadth to the ventral filaments. Beyond these the tail becomes more rapidly compressed, and after a short distance diminishes also in vertical dimension, till it ends in a thin point. A membranous dorsal fin commences at the distance of four inches from the snout, and, gradually increasing to the height of five lines, is thus continued into the caudal membranous expansion. This fin is supported by numerous soft, elastic, transparent rays, articulated to the extremities of the superior and inferior peripheral spines of the caudal vertebræ; the under part of the caudal fin commences about one inch behind the vent. The entire body is covered with cycloid scales, which are relatively larger, but have the same general structure and disposition as in the *Lepidosiren paradoxa*. They present a subcircular form, with a diameter of about three lines; their posterior margin adheres to the strong cuticle with which they are covered, as in other fishes; the anterior lies freely in a corresponding groove of the chorion. When viewed with a low magnifying power, they present a series of canals radiating somewhat irregularly from a centre near the posterior edge of the scales, and maintaining a uniform diameter. These canals are united together by cross canals, which do not form regular concentric lines. The meshes formed by this reticulation are small and of a subquadrate form at the anterior part of the scale, but are more elongated in the middle of the scale; they are again smaller and shorter at the circumference. With a magnifying power of 150 linear diameters, the interspaces of the larger canals are seen to be occupied by a finer network of apparent tubes, and from an angle of each of these spaces a short obtuse process, projecting slightly backwards, is developed on the external surface of the scale; the internal surface is quite smooth. There are three or four faint concentric lines of growth at the circumference of the scale, but the body is evidently one continuous organised whole. The subcuticular tissue of the scale is a kind of dense elastic cartilage, not yielding any gas bubbles on the application of acid. The scales are continued upon the base of the caudal natatory fold of integument.

'The disposition of the mucous pores and ducts upon the head is very similar in the two species of the *Lepidosiren*, judging from the figure given by Dr. Natterer. A linear series of mucous pores encircles each eye, and from the posterior angle of this series the lateral line commences. This line extends backwards nearly parallel with the dorsal line, situated a little more than one-fourth of the vertical diameter of the body of that line, until it nearly reaches the ventral extremities, where it bends down to midway between the dorsal and ventral margins, and so continues to the end of the tail.

'The rudimentary filamentary fins, the analogues of the four ordinary extremities in the Vertebrata, permanently represent in the present singular animal the earliest embryonic condition of the pectoral and pelvic members.

* 'Lepidosiren paradoxa, eine neue Gattung aus der Familie der fischähnlichen Reptilien,' von Johann Natterer, in 'Annalen des Wiener Museums der Naturgeschichte,' band ii., s. 165.

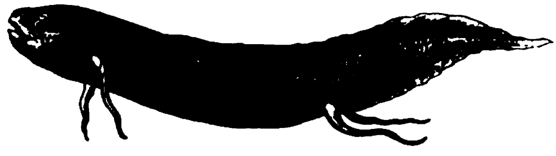
They are round, filiform, gradually attenuated to an undivided point, resembling tentacles or feelers rather than fins or legs, and doubtless restricted to their tactile functions. Each filiform member is supported by a single-jointed, soft, cartilaginous ray. The pectoral tentacles are somewhat shorter and more slender than the ventral ones; the former are two inches, the latter two inches four lines in length.

'The branchial apertures are narrow vertical slits four lines in extent. The eyes appear externally as two small round flat spots of a lighter colour than the surrounding integument; they are situated seven lines from the end of the snout, and nearly the same distance apart from one another. Each of these simple visual organs measures one line and a half in diameter; it is not defended by any palpebral folds of the skin; the cornea is thin, sufficiently transparent to allow the lens to be visible even in the specimen preserved in spirits. The nostrils are situated at the under part of the upper lip, within the opening of the mouth. They appear as two small perforations leading to blind sacs afterwards to be described. The opening of the mouth is wide and defended by well-developed fleshy lips. The skin at the angles of the mouth is thinner than at the rest of its circumference, and the upper lip folds over the lower one from the angle to near the fore part of the mouth; here the lips are thick, smooth, and rounded; the lower lip is the thickest.

'About a line behind the lower lip, between it and the teeth, there project six soft papillose processes, of a triangular form; two of these, which are situated in the middle line, consist of a transverse row of papillæ; the posterior ones are membranous, and the papillæ are confined to their margin and outer surface: they occupy the notches of the broad and strong dental plate.

'Behind the upper lip there are eight similar papillose processes, four on each side; the mesial placed one line behind or within the margin of the lip; the outermost, three lines from the same part; immediately anterior to the interspace of the two outer lamellæ is the orifice of the nostril, which is elliptical, and one line in the long diameter; the olfactory cavity itself is three lines in the long diameter, and its closed posterior part is occupied with two rows of small transverse lamellæ, about twenty in a row, divided by a transverse line.

'There are two small, slender, conical, sharp-pointed and slightly recurved teeth, which project downwards from the intermaxillary bone, to which they are attached by ligaments; and the alveolar border of both the upper and lower maxillaries is armed with a strong trenchant dental plate, anchylosed to the bone, and divided at the middle line so as to form four distinct pieces, two above and two below; each of these teeth or dental plates is impressed on its outside with two notches, extending almost through the whole breadth of the plate, and dividing it into three angular processes, which, from the direction of the notches, appear to radiate from the inner and posterior angle of the tooth: the two anterior divisions in both the upper and lower jaws are the most produced in the vertical direction, and are pointed so as to be adapted for piercing: the posterior divisions are most extended in breadth, and least in height, and terminate in a sharp trenchant edge; the middle divisions present an intermediate structure. These teeth, in their paucity, relative size, and mode of fixation to the maxillæ, resemble those of the chimæra and some of the extinct cartilaginous fishes, as *cochliodus* and *ceradodus*; but they are unlike these in their microscopic structure, and differ from any known dental apparatus in the class of fishes, in the modifications of the working surface which at once adapt them for piercing, cutting, and crushing. The strength of the jaws, and the size of the muscles which work them, are proportionate to the size and formidable character of the maxillary dental plates.



There are no lingual, palatine, pterygoid, vomerine, or pharyngeal teeth.

'The general colour of the specimen was a mixed tint of dark olive-green and brown, growing lighter towards the belly, with irregular dark spots, as big as the largest scales, chiefly confined to the tail: the mucous pores and lines were black.'

The skeleton of this curious fish is partly cartilaginous and partly bony, and the osseous portions are of a green colour, as in the common Gar-fish (*Belone vulgaris*).

In reviewing the principal characters of the skeleton of the *Lepidosiren*, 'we obtain,' says Professor Owen, 'good evidence of its ichthyic nature. If indeed the species had been known only by its skeleton, no one could have hesitated in referring it to the class of fishes; but in that class it would have offered a most singular and interesting combination of the cartilaginous and osseous types.

'The central elements of the vertebral column, the basis of the skeleton, exhibit a persistence of its primitive embryonic condition, such as has hitherto been witnessed only in the sturgeon and cyclostomous fishes; but the superior arches and spinous appendages, instead of retaining the cartilaginous state, are converted into the tough elastic fibrous texture characteristic of the skeleton of fishes. The cranium in like manner presents an extremely novel combination of the cartilaginous and bony states, both as regards its partial ossification and the condition of the ossified parts.

'It is only in the higher cartilaginous fishes, *e.g.* that the maxillary, palatine, and pterogoid bones are blended together to form the simple superior dentigerous arch, or upper jaw. The composition of the lower jaw corresponds with that which characterises most of the osseous fishes, and is more simple than in the Amphibia. The confluence of the cranial vertebræ reminds one of the condition of the skull in the siren: but no vestige of a preopercular bone is present in any of the Perennibranchiates. The sphenoideum basilare, as it exists in the sturgeon, is here seen in its fully ossified state. As the basis of the vertebral column presents a condition analogous to that which characterises the early embryonic periods of the higher vertebrata, so also the extremities retain their simple structure as when they first bud forth, and are devoid of any trace of digital divisions: still the march of development has begun, and we perceive by the numerous joints of the cartilaginous ray, that its direction is towards the ichthyic modification of the great vertebral plan.'

Our limits will not admit of our following Professor Owen through the various peculiarities of the internal anatomy of this anomalous animal, which has been regarded by some naturalists as one of the *Amphibia*. In many points of its structure it certainly does approach that group of animals, especially in the condition of its air-bladder or lungs and its branchiæ; but as regards the former we find considerable advances are made towards the reptilian structure by some other fishes; and it may be remarked that the present animal still differs widely from the *Amphibia* in possessing distinct large scales. There is another character which it appears is of the highest importance in determining the class to which the *Lepidosiren* belongs, namely, the structure of the nostrils. 'In the organ of smell,' says our author, 'we have at last a character which is absolute in reference to the distinction of fishes from reptiles. In every fish it is a short sac communicating only with the external surface; in every reptile it is a canal with both an external and an internal opening. According to this test, the *Lepidosiren* is a fish; by its nose it is known not to be a reptile; in other words it may be said that the *Lepidosiren* is proved to be a fish, not by its gills, not by its air-bladders, not by its spiral intestine, not by its unossified skeleton, not by its generative apparatus, nor its extremities, nor its skin, nor its eyes, nor its ears, but simply by its nose; so that at the close of our analysis we arrive at this very unexpected result, that a reptile is not characterised by its lungs nor a fish by its gills, but that the only unexceptionable distinction is afforded by the organ of smell.' 'Yet it must be confessed that the physiological consequences of the modifications of the nasal cavity above alluded to, would have been far too insignificant to have established the ichthyic nature of the *Lepidosiren*, if, with coexisting gills and lungs, the modifications of the other organic systems had agreed with those of the Perennibranchians instead of with those of fishes.'

In conclusion the author states, 'From every group of fishes however the *Lepidosiren* is sufficiently distinct to form a type not merely of a genus, but of a family; and in the central system it forms a link connecting the higher *Ganoid* fishes with the Saurian genera *Polypterus* and *Lepidosteus*; and at the same time makes the nearest approach to the class of fishes by the Perennibranchiate reptiles.'

'The South American *Lepidosiren* (*L. paradoxa*) greatly resembles the species above described, but differs somewhat in its proportions. The whole length of *L. paradoxa* includes seven lengths of the head, measured from the end of the mouth to the gill-openings; in the *L. annectens* the total length of the animal includes little more than six lengths of the head. This species is therefore distinguished from the *L. paradoxa* by the shorter relative length of the trunk as compared with the head.

One of Dr. Natterer's specimens of *Lepidosiren paradoxa*, which measured upwards of three feet in length, was found in a swamp on the left bank of the Amazon above Villa Nova; the other, which was nearly two feet long, was taken in a pond near Borba, on the river Madeira, a tributary of the Amazon.

PROTOROSAURUS. M. Hermann Von Meyer's name for the fossil Monitor of Thuringia. (Cuv., *Oss. Foss.*, tom. v., p. 300, et seq. pl. 9, 1, 1, 2.)

PROTRACTOR. Any instrument for laying down angles is so called, such as the graduated semicircle which is found in cases of instruments, the rectangular ruler with graduated edges, and various other more expensive contrivances. But the truth is that the easiest and safest protractor is a table of CHORDS, a scale of equal parts, and a pair of compasses; those who have not a sufficient table of chords should take the chord from a table of sines by the formula—

chord of x = diameter × sine of half x.

Even the scale of chords laid down on the rulers, used in the usual manner, is a better protractor than the graduated semicircle, which is worthless, except for very rough work. A good table of chords carried to every minute under 180°, is, we believe, not yet published in this country.

PROVENÇAL. [PROVENCE.]

PROVENCE, a maritime province of France according to the division which existed before the Revolution. It was bounded on the *east* by the principality of Nice, or Nizza, in Italy, from which it was separated by the Maritime Alps and the river Var; on the north it was bounded by the district of Gapençois in Dauphiné; on the north-west by Le Comtat (or county) Venaissin and Le Comtat (or county) d'Avignon [COMTAT, LE]; on the west by Languedoc, from which it was separated by the Rhône; and on the south by the Mediterranean Sea. Its greatest length was from east by north to west by south, between the two extremities of the coast-line, 152 to 153 miles: its greatest breadth from the coast inland 97 miles. Few of the provinces of France possessed greater variety of soil and climate than Provence. The plains, sheltered on the northern and eastern sides by the branches of the Alps, and the lower slopes of the mountains which had a southern exposure, produced fruits which were not found in other parts of France, or at least not of equally fine quality, as the orange, the lemon, the pomegranate, the almond, the olive, &c. The length of coast-line on the Mediterranean Sea induced at an early period a commercial spirit upon the people, and contributed to the revival of letters and refinement earlier than in the rest of France.

The subdivisions of Provence were fiscal, judicial, or ecclesiastical. While the provincial states-general continued, viz. until 1639, there were two principal fiscal divisions: the first was called Le Pays des Vigueries; and the second included the four districts of La Vallée (the Valley) of Barcelonette, Le Val de Barrême, Le Comté de Sault, and Les Communautés des Terres adjacentes et Villes franches. Les Vigueries (the Magistracies) were twenty-two, viz. those of Aix (22,575), Annot, Apt (5707), Aups (3087), Barjols (3212), Brignoles (5940), Castellane, Colmars, Digne (3952), Draguignan (9804), Forcalquier (3036), Grasse (12,716), Hyères (10,142), Lorgues (5444), Moustiers, Seyne (2732), Sisteron (4429), Saint Maximin (3037), Saint Paul, Tarascon (10,967), Toulon (28,419). There was formerly another Viguerie, that of Guillaumes, but it was broken up in 1760, on occasion of an exchange of territory between France and Sardinia. In Les Communautés des Terres adjacentes et Villes franches were Marseille (145,115), Arles (20,236), Salon (5887), Richebois, Les Baux, Notre-Dame de la Mer, or Les Saintes-Maries, Aureille, Fontvielle or Fontvieille (2880), Aubagne, St. Tropez (3786), Entrevaux, Le Mas, Montdragon, Grignan and its county, which last included the Communautés of Montségur, Chamaret, Salles, Colonzelle, Allan, and Réauville. Le Comté de Sault comprehended the Communautés of Sault, Aurel, Monieux, Sainte-Trinité, La Roche, and Ferrassières. The figures subjoined to the above names indicate the population of the respective communes in 1831. After the discontinuance of the States (who appear to have been appointed and to have acted only for Le Pays des Vigueries) the local taxation was adjusted by general assemblies, comprising thirty-six deputies from the Vigueries and principal Communautés, with the representatives of the clergy and provincial noblesse. The judicial divisions do not require to be mentioned. The ecclesiastical divisions consisted of seventeen dioceses, including those of Avignon, Carpentras, Vaison, and Cavaillon in Le Comtat Venaissin and Le Comtat d'Avignon. Provence is now divided into the departments of Basses Alpes, Var, and Bouches du Rhône; some portions are included in the department of Vaucluse.

The name of *Provence* is derived from the designation Provincia, given by the Romans here as elsewhere, to those countries and districts beyond the limits of Italy which they brought under their dominion; and from being at first a merely descriptive term, it has come to be appropriated as a proper name. In Cæsar's time the 'Provincia' of the Romans included not only the modern Provence, but the adjacent and more extensive districts of Dauphiné and Languedoc, and parts of Savoy and Switzerland; and it is in this more extensive application of the term that it is employed by Cæsar in his 'Commentaries.' When his conquests and those of his successors had extended the Roman dominions, new provinces, as Lugdunensis or Celtica, Aquitania, and Belgica were formed; and the original 'Provincia' was distinguished as Narbonensis. At a later period Narbonensis was subdivided into the five smaller provinces of Narbonensis Prima, Narbonensis Secunda, Viennensis, Alpes Maritimæ, and Alpes Graiæ and Penninæ. The modern Provence includes portions of Narbonensis Secunda, Viennensis, and Alpes Maritimæ. In the overthrow of the Roman empire Provence was divided between the Visigoths, who held the coast, and Burgundians, who occupied the inland part, the Durance being the boundary. In 517 the Visigoths ceded their portion to Theodoric, the Ostrogothic king of Italy, and he wrested it from the Franks, by whom it had been seized. In A.D. 536, the Burgundian portion was conquered by the sons of Clovis; and in 534 the other part was ceded to them by Vitiges, one of the successors of Theodoric. The whole was included in the empire of Charlemagne.

On the division of the states of the emperor Lothaire (A.D. 855), Provence was included in and gave name to the kingdom of his youngest son Charles, on whose death (A.D. 863) his kingdom lost its separate existence. On the revival of the kingdom of Bourgogne by Boson (A.D. 879), Provence was included in his dominions, which are sometimes called the kingdom of Provence. This kingdom came by the cession of Hugues (who possessed the royal authority without the title of king) into the hands of Rodolph II., king of Transjurane Bourgogne, who united the whole into one extensive kingdom, under the title of the kingdom of Arles, Gaule Cisalpine, or Bourgogne Jurane. [BOURGOGNE.] It extended from the Jura to the Rhône and the Mediterranean. Upon the death of Rodolph III. (A.D. 1032), the kingdom of Arles was united to the German empire, of which Provence was long considered as a part.

Under the kings of Bourgogne, the greater part of Provence was governed by counts, who fixed their residence and took their title from Arles. The city of Marseille was under its viscounts, from whose superiority the citizens gradually emancipated themselves; and other neighbouring districts became the territories of feudal nobles. Gradually the counts of Arles rendered their county hereditary, and took the title of counts of Provence. The weakness of Rodolph III., the last king of Bourgogne, and the remoteness of the seat of government, after Provence was annexed to the empire, facilitated the aggrandizement of these nobles.

In the year 1112 or 1113, Raymond Béranger I., count of Barcelona, in Spain, became, in right of his wife, count of Provence; but in 1125 he ceded to Alfonso-Jourdain, count of Toulouse, all that part of his territories which were north of the Durance, including Le Comtat and part of what was afterwards comprehended in Dauphiné. This ceded portion was known for a time as the Marquisate of Provence, in contradistinction to the part which remained to Raymond Bérenger, and which retained the designation of the County of Arles or Provence. The following century was distinguished by wars, occasioned by disputed succession, by the rivalry of the counts of Provence with those of Toulouse and others of the neighbouring nobles, or by other causes. But amidst these disorders the prosperity of the country seems to have advanced; and the cities of Aix, Arles, Avignon, Marseille, and Nice profited by the confusion to renounce all but nominal subjection to the counts, and to become practically municipal republics. All of them did not indeed retain their freedom; Arles returned under its former master, the count of Provence, though with restrictions on his authority, and Avignon was taken (A.D. 1226) by Louis VIII. of France, in his campaign against the Albigeois or Albigenses. Among the counts of Provence in this troubled period, Raymond Bérenger IV. (A.D. 1209-1245) was one of the most remarkable. He left four daughters, two of whom, Eléonore and Sancie, were married to Henry III. of England, and his brother Richard, earl of Cornwall and king of the Romans; and the other two, Marguerite and Beatrix, to St. Louis, king of France, and his brother Charles, count of Anjou and Maine. Beatrix, though the youngest, inherited the county of Provence, which thus passed into the Anjevin branch of the royal family of France.

It was under the counts of the house of Barcelona that Provence became the seat of that literature which has given the chief celebrity to its name and the chief interest to its history. Its comparative freedom after the age of Charlemagne from those foreign invasions which retarded in other parts the settlement of society and language, and its situation on the shores of the Mediterranean, which promoted commerce and opened a channel of communication with Constantinople and the Levant, and the generally wise administration of the counts who preceded Raymond Bérenger I., had contributed to bring the language, laws, and customs of the country into a comparatively settled state. The Provençal language gradually supplanted the Latin, which a succession of foreign admixtures had barbarised; and the new tongue, though not employed in deeds and contracts, was employed as the vehicle of reviving literature. [FRANCE; *Historical Sketch of the French Language and Literature*, vol. x., p. 432-3.] 'The succession of Raymond Bérenger to the sovereignty of Provence gave a new impulse to the national spirit, by the intermixture of the Catalans with the Provençals. Of the three branches of the Romanzo used by the Christians of Spain, the Catalan, the Castilian, and the Gallician or Portuguese, the first was almost exactly like the Provençal. . . The Catalans therefore perfectly understood the language of the Provençals, and by their meeting in the same court, each imparted refinement to the other. The Catalans had made considerable improvement, both by their wars and communications with the Moors of Spain, and by the activity of commerce at Barcelona. This city enjoyed the amplest privileges; the citizens appreciated their liberty, and caused it to be respected by their princes; while the wealth which they had acquired, by increasing the productiveness of the taxes, allowed the display of a magnificence at the court of their counts which was unknown to other princes. Raymond Bérenger and his successors brought with them into Provence the spirit of liberty and that of chivalry, a taste for elegance and for the arts, and the scientific knowledge of the Arabs. From this combination of noble sentiments sprang the poetry which in Provence and in the whole of the south of Europe burst out all at once, as if an electric spark had, in the midst of the thickest darkness, kindled in every part at the same time the brightest flames.' (Sismondi, *La Littérature du Midi de l'Europe*.)

The literature of Provence differed materially from the contemporary productions of northern France. These partook of the epic, the Provençal of the lyric character. The theme of the troubadours, or Provençal poets, was love; and they exhibit the passion in their songs with a purity, delicacy, and tenderness, derived probably from the Arabs, with whom their Catalan connection brought them into contact. Yet the actual relaxation of manners among the nobility in the south of France was at this time very great. 'It might be said that men lived only for gallantry; the ladies, who scarcely appeared in public, except when married, prided themselves on the reputation which their charms derived from their lovers; they delighted in the praises of their troubadours; they took no offence at the diffusion of the gallant and often licentious poetry of which they were the theme: they themselves cultivated 'the gay science,' as poetry was called, and expressed their own sentiments in their turn, in tender and impassioned verses; they had instituted 'courts of love,' in which questions of gallantry were gravely discussed, and determined by their suffrages; in a word, they had brought the whole of the south of France into a state of carnival, which forms a singular contrast to the ideas of reserve, virtue, and modesty which we ascribe to the good old times.' (Sismondi, *Littérature, &c.*) It was from the Arabs, through the medium of the Provençal troubadours, that rhyme was introduced into the poetry of modern Europe, according to Sismondi; but others think that it is not clear that rhyme was not used in Europe before the conquest of Spain by the Arabs.

The Provençal language spread, with the poetry of the troubadours, into the various courts of Europe; several of the princes of the West, our own Richard Cœur-de-Lion among others, wrote in it, and it became the most copious and flexible of any of the languages of Western Europe of that period. It was the exclusive vehicle of amorous, warlike, political, and satirical poetry; and the crusades in particular furnished a variety of incidents for those who cultivated it.

The acquisition of Provence by Charles I. of Anjou in right of his wife Beatrix (A.D. 1246) augmented its political importance. Charles had to struggle with the independent spirit of the large towns. Avignon and Arles, which had rejected his authority while he was in Egypt with his brother St. Louis, were obliged to submit, but upon terms which secured to them valuable privileges. Marseille was also reduced, and suffered considerable loss of freedom by the subjection. The death of Beatrix, and the assumption of the sovereignty of Provence by Charles in his own right, led to an opposition to his title by the queens of France and England, sisters of the deceased countess: but as the two kings did not undertake the matter, the opposition was fruitless, and Charles transmitted Provence (A.D. 1285) to his son Charles II., who was then a prisoner in the hands of the king of Aragon. Charles resigned Anjou and Maine to his cousin Charles of Valois, and contested the possession of Naples and Sicily, which his father Charles I. had conquered with the king of Aragon. He also united Piedmont to Provence (A.D. 1306), and died (A.D. 1309) in the neighbourhood of Naples. His son and successor Robert took an active part in the struggle of the Guelphs and Ghibelines in Lombardy. These Italian wars of the Angevin princes materially injured Provence by draining it of its population; but in other respects Robert appears to have governed well, and his death was regretted by his subjects (A.D. 1343). He was succeeded by his grand-daughter Jéanne or Joan [JOAN I.], who granted or sold to the pope the city and lordship of Avignon. Provence was, during her reign, claimed by John of Gaunt, son of Edward III. of England, in right of Eléonore, wife of Henry III. of England, from whom he was descended; and by Louis, duke of Anjou, governor of Languedoc for his brother Charles V. of France, who founded his claim on the cession of the kingdom of Arles made to him by the emperor Charles IV. Provence was invaded by Louis's forces under Bertrand Duguesclin, but without success; and John of Gaunt was obliged to submit his claims to the decision of the pope. On the death of Jeanne, who was taken at Naples, and put to death by Charles of Durazzo (A.D. 1382), Provence came to Louis, duke of Anjou, to whom the deceased countess had bequeathed it. He ceded Piedmont to Amadeus, count of Savoy, and died (A.D. 1384) in the kingdom of Naples, of which he had tried in vain to secure possession. Louis II. succeeded his father, and renewed the attempt to gain possession of Naples, but with like ill success. On his death (A.D. 1417) Louis III. succeeded, and pursued his hereditary claim to Naples, which brought him into a struggle with Alfonso V., king of Aragon [ALFONSO V.], who took Marseille (A.D. 1423). [MARSEILLE.] On the death of Louis (A.D. 1434), his brother René, surnamed le Bon (the Good), succeeded. He united under his sway the duchy of Anjou and the county of Provence, and was competitor of Antoine de Vaudemont for the duchy of Lorraine [LORRAINE], which he succeeded in acquiring. He also attempted to acquire Naples, but met with the same ill success which had attended the efforts of his predecessors. The earlier part of his reign was actively employed in warlike enterprises; but the latter part he quietly spent in Pro-

[illegible] cultivating the [illegible] and the fine arts, and living [illegible] of his subjects' [illegible] family. [illegible] to whose charge he [illegible] gave up the prosecution of [illegible] in Naples. René [illegible] died at Aix, A.D. 1480. Charles, Count of Maine, his nephew and successor, had to defend Provence against the [illegible] of a competitor, René II. of Lorraine, grandson [illegible] of René [illegible] by the support of Louis XI. [illegible] he succeeded in repelling him, and dying soon after [illegible] bequeathed his dominions to Louis. René of Lorraine still asserted his claim, but was unable to maintain it, and Provence was finally annexed to the crown of France by Charles VIII., the successor of Louis XI. (L'Art de vérifier les Dates; Simonde de Sismondi, Littérature du Midi de l'Europe.)

PROVERB (from the Latin *proverbium*, [illegible] in which respect the form of the word bears analogy to [illegible] and other words of the kind), a by-word, which meaning is also conveyed by *adagium*, 'adage,' and the Greek παροιμία (common). Of the many definitions which have been given of a proverb, the best appears to be the following by Erasmus: 'Paroemia est celebre dictum scitâ quâpiam novitate insigne;' 'A proverb is a well-known saying, remarkable for some elegant novelty;' or, as Dykes translates it, 'A proverb is a celebrated saying, famous for its remarkable elegancy, wit, and novelty.' Synesius, a Christian writer of the early part of the fifth century, quotes from a work of Aristotle, now lost, a description of a proverb to this effect: 'A proverb is a remnant of the antient philosophy preserved amidst very many destructions on account of its brevity and fitness for use.' 'Proverbs,' says Daniel Heinsius (Dedication prefixed to Elzevir edition of Apostolius) 'are nothing else but abridged remains of the wisdom which is not comprehended in books, and is conveyed down from hand to hand like an heirloom.' To collect and explain such portions of wisdom has engaged the attention of some of the most learned men. Aristotle, Theophrastus, Chrysippus, and others, according to Laertius, made collections of proverbs. With the works of Plutarch is printed (Opera Moralia, vol. v., ed. Wyttenbach) a collection of 171 proverbs, with explanations; and, though this collection has not been universally acknowledged as Plutarch's, there is good reason to believe it to be his genuine work. Zenobius or Zenodotus, a Sophist who lived at the beginning of the second century, made an epitome of the proverbs of two older writers, Tarraeus and Didymus, in number 552. Diogenianus lived about the same time as Zenobius, and made a collection of proverbs, amounting to 775. These two collections, together with 1400 proverbs out of Suidas, and an appendix of [illegible] from the Vatican library, and a selection of proverbs in metre, were well edited by Andreas Schott, 4to., Antwerp, 1612. Michael Apostolius of Byzantium, who lived in the middle of the fifteenth century, collected [illegible] antient proverbs, of which he wrote explanations. The best edition is that of the Elzevirs, 4to., Lugd. Batav., 1653. The adagia of Erasmus, in number 4151, are too well known to require any description. They are presented in their most useful form in the Epitome of them published by the Elzevirs, 12mo., Amst., 1663. Many other modern writers have published collections of proverbs from various languages. The name of our own countryman, John Ray, is familiar to all the lovers of natural history. In 1672 he published his collection of proverbs, which has been often reprinted. Modern languages contain a great number of proverbs, some of which have been transmitted from the remotest ages, and are the common property of all civilized nations; others are peculiar to individual nations, and are capable of being traced to a modern origin. The Spanish language is particularly rich in proverbs, many of which have obviously had their origin in national peculiarities of character and usage. There is a small and valuable collection of English proverbs with lengthened explanations, and an [illegible] preface, by Oswald Dykes, 8vo., Lond., 1709.

According to the definition given by Erasmus, two things are especially required to constitute a proverb; 1, that it be recognised by all classes of men as common property; 2, that it be marked by a peculiar turn of expression, so as to [illegible] distinguished from ordinary speech. The former quality belongs to a proverb, inasmuch as it derives its [illegible] from [illegible] philosophers, poets, [illegible] and [illegible] from the manners and customs [illegible] from the habits of the brute creation; [illegible] from the general operation of the laws of nature. The latter quality is essential, inasmuch as quaintness, or elegance, or even obscurity of expression, will invest what is old with the appearance of novelty, and make the sentiment striking, and secure such attention as the language of ordinary intercourse never could.

Proverbs generally convey moral instruction, and that in the most direct and effectual way; but moral instruction is not essential to the nature of a proverb. Such proverbs as 'Old birds are not caught with chaff;' 'Birds of a feather flock together;' ''Tis an ill wind that blows nobody good;' 'Money makes the mare to go;' do not, directly at least, teach any moral lesson. Such proverbs as 'Honesty is the best policy;' 'Be just before you are generous;' 'Take care of number one;' and others of the kind, as 'Every man has his price,' seem adapted to make men satisfied with a very low standard of morality. But these are abuses of proverbial teaching, and are of course to be avoided, while due regard is paid to its legitimate use. Good proverbs judiciously employed will 'never fail of pleasing by their quaintness, of delighting by their sharpness, of persuading by their authority.' (Dykes's Preface.)

A full and excellent account of antient and modern collections of proverbs is given in the third volume of the 'Bibliotheca Graeca' of Fabricius. On the general character and use of proverbs, the reader will be gratified by consulting the works of Ray and Dykes already mentioned.

PROVERBS OF SOLOMON, one of the canonical books of the Old Testament. The Hebrew מָשָׁל, translated *proverb*, denotes a similitude, from מָשַׁל, *to liken, compare*, and is rendered in the Septuagint by παροιμία, but oftener by παραβολή. In reference to this book, the use of the Hebrew word is the same as that of the English *proverb*; and Erasmus's definition, as given in the preceding article, will apply to the Proverbs of Solomon.

This book has always been ascribed to Solomon, though he was not the author of all its contents. The thirtieth chapter is entitled 'The words of Agur the son of Jakeh,' and the thirty-first chapter, 'The words of King Lemuel;' and it is not improbable that many of the proverbs in the preceding part of the book were in current use long before the time of Solomon. The portion from the tenth chapter to the end of the twenty-fourth comprises what may more strictly be called the 'Proverbs of Solomon.' The first nine chapters form a kind of introduction, and the remaining chapters after the twenty-fourth may be regarded as an appendix to the whole.

The Book of Proverbs is classed by Bishop Lowth among the didactic poems of the Hebrews (De Sacra Poesi Hebr., Prael. xxiv.). The attentive reader of the original will discover the almost exactness in the choice and arrangement of words, and will be able with ease to carry out the principles laid down by Lowth relating to the structure of Hebrew metre.

The Proverbs of Solomon are all pre-eminently adapted to teach the lessons of prudence, morality, and religion. They are a precious treasury, from which men may be supplied with the best rules for the conduct of life. They may be compared to so many jewels put together without any visible order or connection, but each shining with its own peculiar beauty, a beauty which is increased rather than obscured by the apparently accidental association of one with another. In a word, to use language furnished by the book itself, 'they are like apples of gold in pictures of silver' (xxv. 11). 'Let a man,' says Bishop Patrick, 'but consent to one thing, which this book desires, to make these precepts familiar to his mind, saying unto wisdom, thou art my sister, and calling understanding his kinswoman, and he will not fail to be happy.' (Patrick On the Proverbs of Solomon; Horne's Introduction.)

PROVIDENCE is the superintending care with which God watches over his whole creation, and especially over the human race. It has been generally held, as a direct consequence of the existence of a God who has created all things, that he must also uphold by his constant care everything which he has created. This doctrine however has been denied by the antient Epicureans and the modern Theists, who, while admitting that God created the universe and impressed upon it the laws by which it is governed, have contended, that having done this, he has left these laws to work out their own results without his further interference. The arguments for a superintending providence are derived from the order of the material universe, which we find to be governed by ever-active principles, of which no other explanation can be given than that they are the results of the power of God in continued exercise; from the events which are recorded in history, and which are daily occurring, such as the punishment of guilty nations and individuals, the exaltation of the virtuous, the adaptation of great men to the exigencies of their times, not to mention other circumstances in the history of individuals, which might be considered of a more doubtful character; and lastly, from the unequivocal statements of Scripture. The whole sacred narrative is evidently intended to show how God's providence wrought for the accomplishment of his own designs. Moreover, individuals are mentioned, such as Pharaoh, Nebuchadnezzar, and Cyrus, whom God raised up expressly in order to use them as instruments to effect certain objects. Two books of the Old Testament, those of Job and Esther (we might perhaps add those of Ruth, Jonah, and even others), appear to have been written for the very purpose of confirming our faith in the providence of God; and numerous passages might be quoted which teach the care of God over the whole universe (*Col.* i. 17; *Heb.* i. 3; *Rev.* iv. 11), over all men, whether good or wicked (*Job.* xxv. 3; *Matt.* v. 45; *Acts* xvii. 28; *James*, i. 17), and especially over his own people (*Matt.* v. 25-34, &c.).

The providence of God has been divided by theologians into *immediate*, or that which he exerts without the intervention of second causes, and *mediate*, where ordinary means are employed; into *ordinary*, which relates to occurrences in the common course of nature, and *extraordinary*, where that course is departed from, as in the case of miracles; into *common*, of which the whole world is the object, and *special*, which regards the church; and into universal, which describes the care of God for his whole creation, and *particular*, which is exercised for the benefits of individuals.

PROVIDENCE. [Rhode Island.]

PROVIDENCE, NEW. [Bahamas.]

PROVINCE OF POINT WELLESLEY. [Penang.]

PROVI'NCIA may be defined generally to be a conquered country, beyond the limits of Italy, which was subject to the Roman state. In contemplating the history of Rome, the most instructive part of it, next to a study of the internal organization of the state, is the system of provincial government by which the language and laws of Rome were established on a foreign soil. The effects of this system are permanently embodied in the political system of every European state. In order to exhibit a complete view of Roman provincial government it would be necessary to write the history of Rome, but the following outline may be useful.

The geographical sense of the word Provincia was not the original meaning; originally the term expressed the Imperium, which was granted to a consul or prætor beyond the limits of the city. The precise meaning of the word is not certain, and the common etymology is perhaps doubtful (pro, vinco*); its primary sense however certainly was a power as above explained. In the time of Cicero provincia had undoubtedly obtained the meaning given at the head of this article; and in the latter part of the Republic the Roman state consisted of two distinctly organised parts, Italy and the Provinces. This distinction, though with considerable modifications, continued under the Empire.

With the extension of the Roman conquests beyond Italy, commenced the system of provincial governments. The oldest provinces were Sicily (B.C. 243) and Sardinia (B.C. 237). Upon the conquest of a country, the commander of the army either gave the conquered country a general organization, subject to the approval of the senate; or the country was organized according to the instructions of the senate, by the commander and a body of commissioners chosen from the senate, and appointed by it. This original organization often made very important changes in the existing political forms, but still the conquered people retained their national existence, and were not in all senses incorporated into the Roman state. Originally prætors were appointed to govern the provinces [Prætor]; but subsequently the prætors received a province after the expiration of their year of office at Rome, and were then called proprætores; and towards the close of the republic the consuls in like manner received provinces, which were hence called consulares, and they were styled proconsules. The division of the provinces was made by lot, and sometimes by agreement among the persons entitled to hold them. By a law of C. Gracchus (Sempronia lex), the provinces of the consuls were annually determined before the election of the consuls, for the purpose of preventing all disputes.

By a senatus consultum of the year 55 B.C., it was enacted that prætors and proconsuls should not have the government of a province till five years after the expiration of their prætorship or consulship. The term for which a province was originally held was one year; but the time was often enlarged. The authority of the governor of a province commenced as soon as he left Rome. His functions in the province were both military and civil; he possessed the Imperium, but he was not called a magistratus. In the later Roman writers the common name for governor is præses (Gaius, i. 6), and sometimes the term proconsul seems to be used generally for the governor of a province. The governor was assisted in the discharge of his duties by a quæstor, who looked after the revenue; and by legati, who assisted in the administration, and were generally appointed by the senate, but sometimes by the governor with the permission of the senate. He had also a numerous train of friends and companions, sometimes called contubernales; and also a regular body of clerks, interpreters, and other servants, who formed a prætorian cohort, a name which was also given, and with more propriety, to the soldiers who formed the governor's body-guard. On a new governor arriving in his province, the former governor was required to leave within thirty days.

The province was treated as a conquered country, though the towns retained somewhat of their municipal freedom, but the constitution of many of them at least was refashioned upon the model of Rome, though in this respect there were probably considerable varieties. Under the emperors the political organization of the whole empire became more uniform. The towns had the management of their revenue, and the right of coining; but only towns of the highest class could coin silver. They had a senate like those in the Italian towns, but no magistrates with corresponding powers. The religion of the people was not interfered with.

In some cases part of the land of conquered foreign countries was seized by the Roman state and let by the censors, or the forfeited land was restored, subject to the payment of a rent. All provincial land differed in some essential particulars from Italian land: it could not be the subject of quiritarian ownership, that is, it had not the privileges of Italian land, and it was capable of being transferred without the forms required in the case of Italian land. There was private property in provincial lands, but the ultimate ownership, in the Imperial period at least, was considered to be in the Cæsar or in the Roman state (populus Romanus). (Gaius, ii. 7.) All provincial lands paid taxes (vectigalia et tributa). But certain provincial towns received as a special favour the Jus Italicum, the legal effect of which was to give the land included within the limits of such town all the qualities of Italian land, and consequently freedom from taxation. Such towns also received, as a part of the Jus Italicum, a free constitution like that of the Italian towns, and with it the various magistrates, decemviri, quinquennales (censors), ædiles; and also jurisdictio, or the power of holding courts of justice. Various towns which enjoyed this privilege are enumerated, in Spain, Illyria, Gaul, and elsewhere. The origin of this privilege is assigned by some writers to the Imperial period; but perhaps it commenced earlier. In all the provinces the regular jurisdiction was in the hands of the Roman governor, who exercised it by himself and his quæstor and legati; and for this purpose he made circuits in his province. In reference to this part of his duties, the governor is sometimes called Judex Ordinarius under the later emperors. These circuits, sometimes called conventus, formed what we may call the divisions of a province for judicial purposes. Thus Pliny (iii. 3) says that Hispania Citerior was divided into seven conventus, which he enumerates. The towns which had the Jus Italicum were not comprised in the conventus; they had their magistrates, in the Italian sense of the term, who had jurisdictio; but there was an appeal to the governor. At these conventus there were present a great number of Roman citizens, who were engaged in commerce in the province, or who were publicani, farmers of the revenues. These conventus, which are frequently mentioned by the Roman writers, were not accidental assemblages of persons, but meetings at stated times and places appointed by the

* *Provincia* may be the true orthography.

governor, and principally for the purpose of judicial decision on matters in dispute, both between Roman citizens, and Roman citizens and the provincials. The judices were chosen, after the Roman fashion, from the persons who attended the conventus, or circuit courts. It appears that the fundamental laws of a province were not interfered with. But, as we have seen, the soil retained its former legal character, and was not invested with that of Italic soil, and the personal status or condition of Roman citizens was not communicated to the provincials merely as such. Some of the provinces, as Sicily, obtained the Latinitas [Latinum Jus] from Julius Cæsar, and the Civitas, or complete Roman citizenship, was given to the Sicilians after his death (Cic., *Ad Att.*, xiv. 12); but this was not the general rule. By means of the edict, which the prætor published on entering upon his duties, and which was often framed upon the prætorian edict at Rome [Prætor], many important changes must have been gradually introduced into the legal system of the provinces, and particularly with reference to matters of contract and forms of procedure, in which there could be no ground for the same distinction that was maintained between provincial and Italic land, and which necessarily influenced the rights of landholders and the forms of action. Special enactments (leges) were also sometimes made at Rome with reference to provincial affairs. The governor had complete jurisdiction in criminal as well as civil matters, and both over provincials and Roman citizens; but a Roman citizen could appeal to Rome in a criminal matter.

A province consisted of a variety of parts. Some towns included in it had from the commencement an alliance with Rome and were in all respects free. Others, which had been subdued, were declared free, and were not under the immediate jurisdiction of the prætor. The provinces also contained numerous coloniæ, and both colonies of Roman citizens and colonies of the class called Latinæ. [Latinum Jus.] Thus towards the close of the republican period a province contained, besides those parts of it which were subject to the complete jurisdiction of the governor, allied towns, free towns, Roman colonies, and Latin colonies. According to this view, the province properly comprised those parts and towns which were subject to taxation and to the prætor's immediate jurisdiction. Some writers assert that the Roman and Latin colonies which were sent from Italy into the provinces were in all respects like such colonies in Italy, and that these colonies had quiritarian ownership of the soil, and consequently freedom from taxes. But there is some difficulty about this part of the subject. The privilege called Latinitas, or Latium, was often given to particular towns, the effect of which was to release them from the immediate jurisdiction at least of the Roman governor, and to give them a jurisdictio, or power of holding courts; citizens who filled certain offices (magistratus in such towns) thereby obtained the Roman citizenship. (Strabo, p. 186, speaking of Nemausus. See our article, p. 234.)

The taxes which were raised in the provinces varied in the different countries, according to the products of the provinces, and probably also according to the system of taxation which the Romans found established; for they seem in their administration to have avoided the error of changing more than was necessary. The taxes generally consisted in a capitation tax and a property tax: the latter was sometimes paid in money and sometimes in kind. The state did not collect the taxes, but they were sold or farmed: thus after the Sempronia lex, those of the province of Asia were sold by the censors at Rome, and those of Sicily, with some exceptions, were sold in the respective districts of the country, according to a practice established by Hiero. There was also money paid for the use of the open pasture-lands, which the Roman state appropriated to itself. The tolls and port duties, as well as the pasture-land tax (scriptura), were farmed by the publicani. [Publicani.] Besides these and other regular sources of revenue, the province was subjected to occasional demands of an additional supply, and to many exactions, some of which had a kind of legalised form, and others were merely gifts made to satisfy the demands of the governor, or to secure his favour.

The governor had to give an account of his administration from his own books and those of his quæstor. Originally he gave in this account at Rome; but after the Julian law (B.C. 59) he was required to deposit two copies in the two principal towns of his province, and to send one to the Ærarium at Rome. If the province had ground of complaint against him for maladministration (repetundæ, peculatus), which was no uncommon thing, application was made to the Roman senate; and the great Romans, who were the patrons and friends of the states which made the complaint, were also applied to for their aid and interest. If he had betrayed the interests of the Roman state, he was guilty of the offence of majestas. A regular mode of inquiry and trial (quæstio) were adopted for such occasions. Yet little was done without bribing the powerful men at Rome; and the chance of redress against a governor who had even grossly misconducted himself was very small: it was more frequently obtained through the influence of the powerful Romans, stimulated by motives of private hostility to the accused, than through the justice of the case.

With Augustus commenced a new period. He took under his own care the more important provinces, and those which required a large military force; the rest he left to the care of the senate and the Roman people. This arrangement continued, with some modifications, to the third century. Of the provinces of the senate, two were yearly given to consular men, and the rest to those who had been prætors: these governors were all called proconsuls, and they were assisted by legates. They had the jurisdiction both of the prætor urbanus and peregrinus. Quæstors were also sent with them to their provinces: the quæstors had the same jurisdiction that the ædiles had at Rome. It seems however that the power of the proconsuls in their provinces was considerably diminished. The emperor considered himself as the proconsul of his own provinces, and he governed them, though residing in Rome, by his representatives called legati Cæsaris, who had prætorian power. They were selected from those who had held the office of prætor and consul, or were senators of inferior rank. The imperial governor of Egypt was called præfectus, and he was always an Eques. They held their office so long as the emperor pleased, and received all their powers directly from him. These governors of the emperor's provinces were called præsides and correctores in the later periods, though the name præses was applied under the emperors to a governor either of a senatorial or an Imperial province. They had also legati under them; but in the place of quæstors there was a procurator Cæsaris, who was an Eques or a freedman of the Cæsar; he looked after the taxes and other dues of the emperor, paid the troops, and attended generally to the business of the fiscus. After the time of Claudius, the procurator had jurisdiction in matters that concerned the fiscus. There were also procuratores Cæsaris appointed by the emperor in the senatorian provinces, who collected certain dues, even in those provinces, for the fiscus, independent of what was the due of the Ærarium, or public treasury. Sometimes a small province, or a part of a larger one, was governed by a procurator Cæsaris, with the full power of a præses; this was the case with Judæa, which was a part of Syria, and governed by a procurator who was under the præses of Syria. The general constitution of the provinces remained the same, though, as before observed, a greater uniformity in administration was gradually introduced, and from the time of Hadrian the Imperial rescripts and the writings of the Roman jurists contributed to form a body of common law for the whole empire. The taxes continued as before, and were partly paid in money, and partly in kind; but the object of the Romans was always to have them paid in money. The basis of the taxation was a general census of persons and property, which Augustus introduced, and which was taken from time to time. Certain taxes, as tolls and duties, were let, as before, to the publicani. The towns, at least under the early emperors, seem to have retained their privileges; though some modifications were very early introduced; for instance, Augustus indirectly deprived the citizens of the colonies of their suffrage at Rome, a measure which seems to have led the way to other changes. Numerous colonies, chiefly if not exclusively of the class called military, were also established by the emperors in the provinces; and it is to this period that some writers refer the gift of the Jus Italicum to provincial cities.

The inhabitants of the provinces were now divided into three classes as to political rights, Roman citizens, Latini, and Peregrini. The Roman citizens were either Italians resident in the provinces; or members of Municipia and colonies which had the Roman citizenship; or those who had individually obtained this right. The two latter classes had all the privileges of Italians, except with some restrictions as to attaining the senatorian dignity; but many of them obtained the rank of Equites. The Latini had not the connubium only and the commercium, but they could obtain the civitas in several ways. The Peregrini had neither the connubium nor commercium; in fact, they had none of those rights which characterised a Roman citizen; but yet they served in the army. By a constitution of Antoninus Caracalla (A.D. 211-17), the citizenship was given to all persons within the Roman empire, and accordingly the distinction of Civis, Latini, and Peregrini ceased, and the two latter classes henceforward only existed among manumitted slaves.

The administration of the provinces gradually came more under the power of the emperor, and particularly as to matters which required a legal decision. The governors not only received general instructions from the emperor, but they made special application to him in cases of difficulty. The constitution of Caracalla must have had the immediate effect of extending the Roman law, for in making all persons Roman citizens, it established all the relations of personal status that existed at Rome; and it seems that a province became in nearly every respect assimilated to Italy, with perhaps the exception as to the soil, when the special privilege was not given to it. Indeed Italy itself was assimilated to the form of a province by Hadrian, who divided it, with the exception of a district that was immediately appropriated to the praetor urbanus, into four divisions, which he placed under the care of consulares. Under M. Aurelius, the consulares were replaced by juridici, a word which indicates their function of dispensing justice. The privileges of the towns, as to jurisdiction, were gradually encroached upon by the Imperial power and those to whom it was deputed, a change the commencement of which is traced by Savigny to the time when Cisalpine Gaul ceased to be a province and was incorporated with Italy. In the provinces justice was administered generally by the praeses and his legati, though not always in the first instance, and the privileges of the free towns were in course of time impaired. The praeses and his legati had full jurisdiction; there was an appeal from the legati to the praeses, and from him to the emperor; and it was not uncommon for the proconsul to refer a matter of law to the emperor even in the first instance. The praeses had complete jurisdiction in criminal matters; yet he could not pronounce sentence of deportation. He had also ample powers both civil and military for maintaining tranquillity in his province, and there were soldiers stationed in all the provinces in permanent camps, many of which remain to the present day, and others were the origin of existing towns.

The condition of the provinces under the Christian emperors would require a separate and lengthened notice.

This general and necessarily very incomplete view may be completed by those who can refer to Savigny's *Geschichte des Römischen Rechts im Mittelalter*, vol. i.; to Walter's *Geschichte des Römischen Rechts*, &c., Bonn, 1840; where abundant references to original authorities are given. The statements in Adam's *Roman Antiquities* are generally correct. Incidental information will also be found in the following essays:—'Das Ackergesetz des Sp. Thorius,' *Zeitschrift*, x.; 'Ueber den Inhalt der Lex Rubria de Gallia Cisalpina,' *Ibid.*, x.; 'Ueber das Jus Italicum,' *Ibid.*, vol. v.)

The enumeration of the provinces is given under ROME.

PROVINCIALISM. The difference between the languages of a family and the dialects of a language is only a difference of degree. For example, the Sanscrit, Persian, Teutonic, Greek and Latin, Slavonic, and Celtic, are languages of the Indo-Teutonic family [LANGUAGE, vol. xiii., p. 309]; and the Doric, Ionic, and Æolic are dialects of the Greek language. Although the dialects of a language may present considerable differences both in the roots and forms of their words, the differences are less considerable than those which obtain between languages of the same family. Thus a historian tracing the origin of the Romance languages might doubt whether he ought to consider them as altered dialects of the Latin language, or as cognate languages of the same family. If the Italian, Spanish, and French languages were considered as modern Latin dialects, their various dialects (such as the Sicilian, Venetian, Milanese, Walloon, Valentian, &c.) would be regarded as mere varieties, analogous to the varieties of the Doric dialect as spoken by the different states of the Doric race. (Müller's *Dorians*, app. v.)

Every language which is spoken by a large population over a wide extent of country, contains several dialects. The number and variety of these is in some cases very great; and considering the importance of this fact as bearing on the origin and history of languages, it has not been sufficiently observed by philologists.

The cause of a want of attention to the multiplicity of dialects in a language is to be found in the ascendency which one dialect of a language always acquires over the others, and the obscurity and neglect to which the latter are consequently consigned. Whenever a country reaches a sufficient height of civilization to admire and produce literary works, some one of the various dialects of its language is selected by the poets and other native writers, and is cultivated by them. In general, this choice is determined not by any quality of the dialect itself, such as its superior harmony or energy, but by some external circumstance, such as its prevalence near the birth-place or home of the writer, or near the king's court and seat of the government. The influence of the latter circumstance is illustrated by the following remarks of Dr. Jamieson, in his preface to his dictionary of the Scottish language, respecting the cause of the decline of that language:—'The union of the crowns (he says), although an event highly honourable to Scotland, soon had an unfavourable influence on the antient language of the country. She still indeed retained her national independence; but the removal of the court seems to have been viewed as an argument for closer approximation, in language, to those who lived within its verge. From this time forward, as living authors in general avoided the peculiarities of their native tongue, typographers seem to have reckoned it necessary to alter the diction even of the venerable dead. In thus accommodating our antient national works to the growing servility of their times, they have in many instances totally lost the sense of the original writers. In this manner even the classical writings of our ancestors have been gradually neglected.' When a dialect, by any of the means above described, has been distinguished from and raised above the others, it is adopted for all the native literary compositions, both in poetry and in prose. Hence it is still further cultivated, and is moreover thereby rendered more susceptible of ulterior cultivation and refinement. It becomes the general language of the government, of education, of literature, and of polished society; new words are introduced into it from other languages, antient or modern; and it is learned by foreigners.

The rise and progress of one dialect, according to the general description just given, may be observed to have taken place in every civilised country. In *Greece*, on account of the multiplicity of independent states into which the nation was divided, each dialect of the language received a separate cultivation. The early historians and philosophers wrote in the Ionic dialect, and lyric poetry was composed in the Doric and Æolic dialects. But after the Persian war, and the great predominance of the Athenians, both in political power and in literature, the Attic dialect obtained the ascendant in Greece and became the common literary language. (Müller's *History of Greek Literature*, c. 20, § 1, 2.) In like manner, the Tuscan dialect, chiefly on account of the pre-eminence of the Tuscan writers, became the literary language of *Italy*, and threw into the shade the Sicilian dialect, in which the first essays of Italian poetry were made. But notwithstanding the predominance of the literary Tuscan in Italy, both as the literary language and as a means of communication between inhabitants of different parts of Italy, yet every Italian city or territory has its own dialect, which is habitually spoken, not only by the lower and middle classes, but also by the upper classes when persons from other parts of Italy or strangers are not present. [ITALY, vol. xiii., p. 62, 63.] In *France*, the dialect of the *langue d'oil*, spoken in and about the seat of government, has not only thrown into the shade the other dialects of that language (such as the Walloon, Picard, Norman, &c.), spoken in the northern portion of the kingdom, and reduced them to the condition of mere patois, but it has also superseded the *langue d'oc*, the language of the south, which had been raised to considerable literary importance by the poems of the Troubadours. [FRANCE, vol. x., p. 45.] The Castilian dialect has obtained a similar ascendency in *Spain* through the influence of the Castilian writers; and the high German of Saxony has become the literary language of *Germany* mainly through the influence of Luther's translation of the Bible; although the Suabian dialect received a literary cultivation in the lays of the Minnesingers before any other of the German dialects. [GERMANY, vol. [illegible] p. [illegible].) The classical *English* is mainly formed from the dialect spoken in Middlesex, Surrey, Kent, and the other counties in the neighbourhood of London. Its forms differ materially from those of the dialects spoken in the more distant counties, as Devonshire, Somersetshire, Cheshire, Lancashire, and Yorkshire; and still more from those of the dialect of the English which is spoken in the lowlands of Scotland, and in the border counties of England. The latter dialect has received considerable literary cultivation not only from early writers, such as Barbour, Dunbar, and others, but also from Burns, Walter Scott, and their imitators, who have used it with great skill and success for ballad poetry and tales of fiction.

A peculiar dialect of the English has been formed in the New England States of the American Union, a specimen of which may be seen in the humorous work by Mr. Haliburton, entitled 'The Clockmaker.' The American dialect of the English contains a few words which are peculiar to the country (such as *caucus*, *moccasin*, *papoose*, *squaw*); but most of the American expressions have been borrowed from English provincialisms, and are still current in different parts of England (as, *I reckon* and *I guess*, *[illegible]*, [illegible], &c.). (See Pickering's *American Vocabulary*, Boston, 1816.)

By a provincial word is meant a word which is not received in the literary language of the time, but which is current among the inhabitants of some district; and provincial words may be divided into the following classes:—

1. Words formerly current in the literary dialect of the language, but which have ceased to be so, and are current only as provincialisms. For example, the word *cantle*, meaning a piece or fragment, and *shard*, meaning cow-dung, are used provincially in parts of England, though obsolete in the literary language. They were however literary words in the time of Shakspere:—

> 'See how this river comes me cranking in,
> And cuts me from the best of all my land
> A huge half-moon, a monstrous cantle out.'
>
> *1 Hen. IV.*, act iii. sc. 1.

> 'Ere to black Hecate's summons
> The shard-borne beetle, with his drowsy hums,
> Hath rung night's yawning peal, there shall be done
> A deed of dreadful note.'
>
> *Macbeth*, act iii. sc. 2.

(See *Craven Glossary* in v. 'shard.')

So *clomb*, the preterit of *climb*, occurs in Chaucer and other old writers, but is now only a provincialism.

Sometimes an antient classical word, though current provincially in ordinary discourse, is used as a literary word only in poetry or as a technical term. Thus the old words *coward* for coward, and *damk* for damp, which are still used familiarly in the provincial language of some districts, could only be employed as literary words in poetry or in poetical prose; and the old word *soller*, meaning an upper floor, which is current as a provincialism in many parts of the country, is only recognised by the literary language as a legal term, being thus used in the general words of a conveyance ('cellars, sollers,' &c.)

2. Words which are not known to have ever been received in the literary language of the country. Many words of this class will occur to any person who consults a provincial glossary of any language. In some cases the word differs widely from any word which occurs either in the modern literary language or in old writers; more frequently however the difference consists mainly in the form. The Scotch dialect presents obvious examples of all these varieties. Sometimes a provincial word is not a dialectical variety of form, but is a corruption arising from ignorance, as *anatomy* for *anatomy*, *vasty* for *vestry*.

From the manner in which provincial dialects are preserved, it is natural that many archaisms of language should remain current in them after they have been lost in the literary language. Thus Buttmann, in his 'Lexilogus,' explaining the word *ἀσσαιον*, which occurs in Homer, cites statements of grammarians that *ἀσσαιον* meant barley, among the Cyprians and Thessalians, and proceeds to remark as follows:—"That Homer never used the word *ἀσσαιον* is no contradiction to this derivation, any more than that it was borrowed from the Cyprians or Thessalians. Heyne has judiciously observed, that old words which disappeared from common use were still visible much later in certain dialects. Such idioms were noted while Greek was still a living language, in part for the very purpose of explaining Homer and other antient writers; and thus such words as [illegible] were introduced into the glossaries. *Ἀσσαιον* therefore was a genuine old name for barley, and though in Homer's time and in his particular country it might not have been the common name for it, still an expression taken from this word might very well have been in use in the language of common life" (p. 76, Engl. Transl.). It may be here remarked that words peculiar to any dialect were called by the Greeks *γλῶσσαι* (Aristot., *Poet.*, c. 21); whence *γλωσσάριον*, or glossary, meant originally a collection of such *γλῶσσαι*. (*Quarterly Review*, vol. [illegible], p. 365.) Afterwards a *gloss* came to mean any comment, and was applied to the commentaries on the *Corpus Juris* made in Italy in the middle ages.

Provincial dialects are chiefly preserved among the humbler and illiterate classes; educated persons generally speak the literary language of the country. Moreover they are chiefly preserved in rural districts; and thus many of the provincial words relate to agricultural subjects. (Preface to Boucher's *Glossary*, p. xliv.) In Fielding's time, country gentlemen in England often spoke the provincial dialect of their county, as may be seen by Squire Western's language in 'Tom Jones.'

Provincialisms, being either antient classical words usually obsolete in the literary language, or diverging words or forms in a parallel dialect, are genuine remains of the antient language of the country. In this respect they differ materially from the following classes of words:—1. Low, vulgar, or obscene words, which are of universal or general currency, and are not confined to any particular locality. (Grose's *Dictionary of the Vulgar Tongue*, and the *Dictionnaire du Bas Langage*.) 2. Slang or cant expressions, used by gypsies and thieves for the purpose of concealing the subject of their conversation in the presence of persons who are not their accomplices (called *gergo* by the Italians, *argot* in French, and *germania* in Spanish). A glossary of the slang of the London thieves (which however seems to be very variable) is appended to Hardy Vaux's 'Memoirs.' A slang or cant language is often formed among classes of persons following any peculiar pursuit; thus there is a slang of the prize-ring and the stable in this country, and there is said to be a slang among bull-fighters in Spain. 3. Technical words, such as the peculiar language of sailors or miners. 4. Neologisms, such as the words *talented*, *jeopardize*, in English.

Collections of provincial words are important in a philological point of view, as throwing light on the formation, structure, and analogies of languages; they are also important in a historical point of view, as illustrating the changes in the language of a country.

The glossaries of provincial words which have been published in different countries are very numerous, though in general they have been made with little philological skill or knowledge, and are meagre in the explanations and illustrations of the meanings of the words. The limits of the present article do not permit us to give a list of the title-pages of even the principal provincial glossaries; but we will enumerate some of the dialects of the chief European languages of which glossaries exist. For the Italian there are glossaries of the Sicilian, Neapolitan, Venetian, Bolognese, Parmese, Veronese, Mantuan, Brescian, Bergamasque, Milanese, and Piedmontese dialects. There are also short popular poems published in all or most of the Italian dialects. (Denina, *Mémoires de l'Académie de Berlin*, 1797; *Classe des Belles-Lettres*, p. 64-90; Adelung's *Mithridates*, vol. ii., p. 490-525.) We are not aware of the existence of a glossary of any Spanish dialect; an account of the Catalonian dialect, which closely resembles the *langue d'oc*, may be seen in the 'Mélanges sur les Langues et Patois,' p. 397-421, Paris, 1831. Dictionaries of the *langue d'oc* and of some of its varieties, as the Provençal and Limousin, exist. Copious specimens of the dialects of the French, or *langue d'oil*, may be seen in the 'Mélanges sur les Langues et Patois,' above cited. There are likewise glossaries of the Walloon French, and of the French of Geneva. For the German language glossaries exist of the dialects of the following countries and districts:—Austria, Bavaria, Esthonia and Livonia, Friesland, Hamburg, Henneberg, Holstein, Mark of Brandenburg, Meissen, Upper Palatinate, Pomerania and Rügen, Prussia, Saxony and Thuringia, Lower Saxony, Silesia, Suabia, German Switzerland, Westerwald, Westphalia. There are likewise general glossaries of Low German (platt-deutsch), of Southern Germany, and of the dialect of the German Jews (*Jüdisch-deutsche Mundart*). For the English language there are glossaries of the dialects of Norfolk, Suffolk, Sussex, Devonshire, Somersetshire, Cornwall, Herefordshire, Cheshire, Lancashire, Yorkshire, Cumberland, Westmoreland, and Northumberland; to which may be added Jamieson's 'Scottish Dictionary.'

A copious list of works illustrating the provincial dialects of England has been recently published in London.

As several persons appear to be engaged at present in making collections of provincial words in England, we may be permitted to remark that the principal defect of the provincial glossaries which have been hitherto published in this country consists in the brevity and vagueness of the explanations of the words, and the want of illustrative examples of their usage in conversation.

PROVINS. [SEINE ET MARNE.]

PROVISIONS, PROVISORS. [PRÆMUNIRE.]

PROVOST, a term having its origin apparently in the Latin *præpositus*, which denotes the chief of any society, body, or community. In France the corresponding word *prévôt* approaches nearer the original form. In that country it is applied to the persons who discharge the functions of many different offices, but in England it is rarely used: we believe the only instances are those of the heads of certain colleges, as Eton, King's College (Cambridge), &c. But in Scotland it is used to designate the chief officer in cities, as the provost of Edinburgh or of Glasgow, where in England the same officer is called the mayor.

PROVOST-MARSHAL, a term adopted from the French, who call an officer with similar functions the prévôt des maréchaux de France, or at least did so before the Revolution. The English provost-marshal is attached to the army, his duty being to attend to offences committed against military discipline, to seize and secure deserters and other criminals, to restrain the soldiery from pilfering and rapine, to take measures for bringing offenders to punishment, and to see to the execution of the sentences passed upon them.

PROX, Mr. Ogilby's name for his last genus (the sixth) of *Cervidæ*, the type being *Prox moschatus* (*Cervus Muntjac*). [DEER, vol. viii., p. 362.]

The following are the genera comprised under Mr. Ogilby's family *Cervidæ*, which he makes the second of the order *Ruminantia*, the *Camelidæ* being the first, and the *Moschidæ* the third; assigning to *Cervidæ* the following character:—

Feet bisulcate; *horns* solid, generally deciduous, in the male only or in both sexes; incisor teeth (*dentes primores*) above, nine; below, eight.

Genera.

1. *Camelopardalis*. Horns in both sexes permanent, simple, covered with skin.

2. *Tarandus*. Horns in both sexes, subpalmated, deciduous. Type.—*The Reindeer, Cervus Tarandus*.

3. *Alces*. Horns in the male only, palmated, deciduous. Type.—*The Elk, Alces Machlis* (*Cervus Alces*, Linn.).

4. *Cervus*. Horns in the male only, ramose, deciduous. Types.—*The Stag, C. Elaphus* and *Cervus Saumer*, or *Hippelaphus*, Cuv.

5. *Caprea*. Horns in the male only, subramose, deciduous. Type.—*The Roe, Caprea Capreolus*.

6. *Prox*. Horns in the male only, subramose, deciduous. Type.—*The Muntjak*.

PROXY. [LORDS, HOUSE OF.]

PRUDE'NTIUS, AURE'LIUS, born in Spain, A.D. 348, followed the profession of the law, and was employed in some official situation in his native country under the reign of Honorius. About the year 407 he repaired to Rome, partly on business, and partly, it seems, from religious motives. He afterwards returned to Spain, where he spent the rest of his life in pious practices and studious pursuits. The precise time of his death is not known. Prudentius wrote several works in Latin verse. Two books are entitled 'Orations' against Symmachus, prefect of Rome, who had addressed a petition to the emperor in the name of the senate of Rome for the re-establishment of the temples and rites of the old religion. [OROSIUS.] Prudentius exposes the absurdity and abominations of the heathen mythology, and the corruption resulting from the want of a moral check, in which the old heathen religion was deficient. Towards the end of the second, he eloquently descants against the cruel practice of gladiators' combats for the amusement of the people; and in order to show their brutalising influence, he instances a vestal attending in the amphitheatre, and witnessing the struggles and agonies of the fallen gladiators in the arena, exclaiming with joy that such sights were her delight, and giving without compunction the signal to dispatch the fallen:

> 'Et quoties victor ferrum jugulo inserit, illa
> Delicias ait esse suas; pectusque jacentis
> Virgo modesta jubet, converso pollice, rumpi.'

Arnobius (b. iv.) towards the end casts a similar reproach upon the vestals.

Prudentius wrote also: a series of sacred hymns, which have considerable poetical merit, and some of which have been inserted in the Liturgy of the Roman Catholic church; 'Psychomachia,' which is a description of the struggles between passion and duty in the human soul; and several books against the Marcionites and other heretics. One of the best editions of the works of Prudentius is that of Parma, 2 vols. 4to., 1788.

PRUNING. [PLANTING.]

PRUNUS is a genus of arborescent Rosaceous plants, which belongs to the Amygdaleous division of the order, and comprehends several of our domestic fruits. The Cherry, Bird Cherry, Plum, Damson, Sloe, Bullace, and Apricot are all comprehended in the genus as limited by Linnæus. But, in the opinion of some modern botanists, the true Plums require to be separated from the others, and should exclusively constitute the genus Prunus, while the others are to be considered as belonging to two other genera represented by the Cherry and the Apricot. In this view of the subject, each genus is characterised thus:—

Armeniaca, or the *Apricot*. Drupe woolly outside. Stone blunt at one end, sharp-pointed at the other, with a furrow passing all round it, and an even surface. Young leaves rolled up.

Cerasus, or the *Cherry*. Drupe smooth, without bloom. Stones roundish, smooth. Young leaves folded flat.

Prunus, or the *Plum*. Drupe smooth, covered with bloom. Stone sharp-pointed at each end, furrowed all round, and smooth on the surface. Young leaves rolled up.

Of the Plum genus, thus restricted, there is in common use the Garden Plum (Prunus domestica), with all its numerous varieties, the Bullace (P. insititia), and the Sloe (P. spinosa). These plants are distinguished specifically by botanists, but apparently without reason. It is the opinion of the best experimental physiologists that the Sloe of our hedges was the origin of the others; and certainly there is not more difference between a Sloe and a Greengage than there is between a German Quetsche and an English Wh[ite] Magnum-Bonum. Several other species belong to the genus, but they are of no moment, with the exception of a plant called Prunus Coccomilia, which inhabits the mountains of Calabria, and has a great reputation in Italy on account of the tonic qualities of its bark.

PRURI'GO is a disease of the skin characterised by an eruption of small pimples and a most intense burning sensation of itching. The pimples are usually but slightly if at all red, and the skin between them has its natural colour. They are generally seated about the shoulders, back and neck, but often also on the limbs, and in severe cases even on the face and over a great part of the body. Their course is always very slow, and they are not infectious.

There are three principal varieties of Prurigo, namely, P. mitis, P. formicans, and P. senilis; and besides these, some others are distinguished by the names of the parts which are in each exclusively or chiefly affected.

The Prurigo mitis is the mildest form of the disease. The pimples are very small, and so pale that they can scarcely be discerned, till, by the scratching, which is almost unavoidably resorted to in order to relieve the intolerable itching, their tops are torn off, and become covered by little black scabs of dried blood.

In P. formicans all the symptoms of the disease are more severe, and the itching by which they are accompanied is united with a painful burning sensation in the skin, as, the patients say, hot needles were constantly piercing it. Both this and the preceding form of Prurigo may disappear with a slight desquamation in a few weeks, but more commonly a succession of eruptions follow one another, and the disease is prolonged for months or even years. Both of them occur in persons of all ranks and ages, but they are most common in the young and in the old, and among those who enjoy fewest of the comforts of life. They are not attended by any important constitutional disorder.

Prurigo senilis, which is by far the worst form of the disease, occurs almost exclusively in enfeebled children and old people. It usually lasts for years, producing all the time almost intolerable suffering by the intense itching that attends it, and which scarcely admits of relief by any known means. The pimples are usually very numerous, and often hard and prominent; the skin between them is also often thickened and coloured, often eruptions break out upon it, and if cleanliness be not carefully observed, it becomes infested with swarms of lice.

The treatment of the two first forms of Prurigo must consist of a mild antiphlogistic regimen, tepid baths, and the use of alkalis both externally and internally. Stimulants of all kinds greatly increase the pain and itching, but they may sometimes be relieved by the application of ointments or lotions containing small quantities of opium, or Prussic acid, or cyanuret of potassium. In the Prurigo senilis the regimen must be more nutritious, and tonic medicines are useful; but in this form, as well as in the others, stimulants must be avoided. If the skin is infested with vermin, the most effectual mode of destroying them is fumigation with the vapour of cinnabar. In this form also sulphur-baths are among the few means that will produce any relief. The alkaline lotions, which may be used in all cases, may be composed of one or two drachms of carbonate of potash to the pint of water, or of from one to three drachms of sulphuret of potash to the same quantity of water, the strength being determined by the irritability of the skin, and being always made less than sufficient to excite any heat or redness in it.

PRUSSIAN. [Hydrogen.]

PRUSSIA consists of two great divisions, which are unconnected with one another. The western and smaller portion is situated on both sides of the Rhine, and called Rhenish Prussia (Rhein-Preussen). It extends between 49° and 52° 15′ N. lat., and between 6° and 9° 30′ E. long., and on the south borders on the French department of Moselle. On the west of it lies Belgium and Holland, and on the north the kingdom of Hanover. Portions of the last-mentioned country, with Brunswick, Lippe, Waldeck, and the electorate of Hesse, extend along its north-eastern boundary-line, and separate it from the larger portion of the Prussian monarchy. Farther south it borders on Nassau, Hesse-Darmstadt, and that portion of Bavaria which lies west of the Rhine. It comprehends an area of about 19,580 square miles, or about three-fourths of the area of Scotland.

The eastern and larger portion of the Prussian monarchy, more properly called Prussia, though, strictly speaking, only the eastern portion of it bears that name, extends from 49° to 55° 50′ N. lat. and from 9° 50′ to 22° 50′ E. long. On the north-west of it lies Mecklenburg; on the west Hanover, Brunswick, and the electorate of Hesse. Along the southern boundary are the duchies of Saxony, the kingdom of Saxony, and several portions of the Austrian monarchy, and along the eastern side are the kingdom of Poland and Russia. The area of this portion is about 91,610 square miles, or about 7000 square miles more than the surface of Great Britain. The whole Prussian monarchy has a surface of 111,170 square miles, which is about 2000 square miles less than that of the British Islands.

Surface and Soil.—I. Rhenish Prussia is divided into two equal portions by the Rhine, and each of these divisions consists of an elevated table-land and a low plain. The table-land on the west bank of the Rhine is connected on its south-eastern border with the Hardt Mountains, as the northern extremity of the Vosges is called. It extends over that part of Bavaria which is situated on the west side of the Rhine. The Hardt Mountains attain an elevation varying between 1100 and 1600 feet, and the highest summit, the Calmet or Kalmuck, is above 2000 feet. From this mountain-region the table-land extends northward to the parallel of the towns of Bonn and Aachen (or Aix-la-Chapelle). Along the south-eastern banks of the river Moselle is the highest part of the table-land, which appears in the shape of a range elevated on a very high base. Part of this range is called the Hochwald, and another part the Soonwald: its mean elevation is more than 2000 feet above the sea-level, while the highest summit, called the Walderbaumkopf, attains nearly 2570 feet. The larger part of the table-land lies to the north of the Moselle river, and is called the Eifel, and in its northern districts the Hohe Venn. The mean elevation of this part is about 1600 feet, and it may be called a plain; neither the summits nor the depressions are great. A few hills rise from 500 to 700 feet above it. This region has lately attracted much attention, on account of the unequivocal traces of volcanic action which it presents in its basaltic and trachytic formations. Geologists have discovered some craters which are now filled with water, and are thus converted into small lakes. Traces of lava are frequent, and amidst them are conical hills resembling at first active volcanoes. The soil of the table-land is very poor, and produces only moderate crops of oats and potatoes, where it is cultivated. The tracts which are not cultivated are partly moors, overgrown with peat and moss, and partly swamps, which are very extensive on the Hohe Venn. In other places tracts of sand occur. The soil in the valleys with which the edges of the table-land are furrowed, is much better, and especially the valleys of the Moselle and Rhine; but even here the fertility is only moderate, with the exception of a district surrounding the town of Trier (Trèves), where good crops of wheat are raised. As far as this region lies within Prussia, it does not appear to contain metals or any useful minerals.

The lower country which extends from the northern border of the Eifel and Hohe Venn, between the Rhine and the Maas, is nearly a flat which sinks imperceptibly as we proceed northward. Its fertility is considerable, and it produces rich crops of all kinds of grain.

Opposite the table-land of the Eifel, on the right bank of the Rhine, is a similar table-land, which extends southward through Nassau, where it rises along the banks of the Main and Rhine to a more elevated ridge known under the name of Taunus, which, like the Hochwald and Soonwald, attains a mean elevation of 2000 feet, and its highest summit, the Feldberg, is 2840 feet. From the Taunus the table-land extends northward, and terminates on the northern bank of the river Ruhr, an affluent of the Rhine. It extends about 40 miles farther north than the table-land west of the Rhine, and, between the Lahn and Sieg rivers, is called Westerwald; and, between the Sieg and Ruhr, Sauerland. The mean elevation of this district does not differ from that of the Eifel, being also about 1600 feet above the sea-level. But the surface is more uneven, especially that of the Westerwald, which contains several high summits, among which the Salzburgerkopf is 2172 feet high. Lava, trachyte, and basalt are also frequently met with in the Westerwald, but not north of the Sieg river. The soil of the whole region is poor; and it is unsuited for the production of any grain except oats, which supply the inhabitants with bread. The population is considerable, especially in the Sauerland, which is, without exception, the most manufacturing district in Germany, a circumstance owing to the abundance of iron and coals which this part of the table-land contains.

The Rhine separates the two table-lands just mentioned, and runs in a narrow valley which is noted for its picturesque beauties. It begins to run between the mountains at Bingen, where its surface is a little more than 250 feet above the sea-level. It leaves the mountain-region at Bonn, where it is not more than 120 feet above the sea. In a course of about 76 miles it falls more than 50 feet. Between Bonn and Düsseldorf, a distance of nearly 50 miles, the fall is only 26 feet.

That portion of Rhenish Prussia which lies to the north of the Sauerland, and extends to its northern limits, has a soil which varies greatly in fertility. The western portion of it, from the Rhine to the banks of the Ems, is nearly a desert: the cultivable ground, which only occurs in isolated places, is only a small portion of the whole. On the east of the Ems the soil is much better, especially as we approach the hilly country, which extends along the western side of the river Weser, where wheat is raised: some good tracts occur also along the northern declivity of the Sauerland, but they are not extensive.

II. The Eastern and larger portion of Prussia is a part of the great plain of Eastern Europe, which extends from the Straits of Dover to the foot of the Uralian Mountains. Mountains occur only along the southern boundary. On the boundary of Prussia and Bohemia is that mountain-range which bears the general name of the Sudetes, and whose northern portion is called Riesengebirge, or Giant Mountains. There are mountains also on the line which separates Prussia from Saxony. Where the south-western angle of Prussia is intersected by the duchies of Saxony and the territories of the princes of Reuss, and partly also by Hanover, it comprehends parts of the two mountain-systems of the Thüringerwald, or mountains of Thuringia, and of the Harz.

The Sudetes are not connected with the Carpathian Mountains. At the north-western extremity of the last mentioned range there is a nearly level plain, between 45 and 50 miles wide, on which the Oder rises. This plain is only 600 or 700 feet above the sea-level; and it descends on the north along the course of the river Oder with a gentle slope, but rapidly towards the south. On the north-western edge of this plain the southern extremity of the Sudetes commences with the mountain-plain of Glatz, which is surrounded by elevated ranges. It rises with a steep ascent, and extends in a north-western direction for about 70 miles, when it again descends with a similar slope. Its interior, the mountain-plain of Glatz, is between 1200 and 1300 feet above the sea; but the ranges which surround it rise to 3500 and 4300 feet. The highest summit, which lies at the south-eastern corner of the mountain-mass, is called the Altvater, and is 4281 feet above the sea. The whole region occupies a width of about 27 miles, and is called the Mountains of Glatz. Between the northern extremity of this range and the Giant Mountains is a tract the surface of which is chiefly occupied by high hills and low mountains; but its mean level above the sea does not exceed 1500 feet. It is followed in the same north-western direction by the Giant Mountains, which, for more than 30 miles, continue as a chain of equal elevation, whose upper part is nearly 4800 feet above the sea. In the middle of the chain, where the river Elbe rises, on its western declivity, is the Schneekoppe, also called Riesenkoppe, which is 5291 feet above the sea-level, and is the highest mountain in Germany except the Alps. The width of this range is about 14 miles, and the country at its north-eastern base is from 1500 to 1800 feet above the sea. The greatest part of this mountain-system is covered with wood, chiefly pine and fir, and only a small part of the valleys, which are rather narrow, is fit for cultivation. The higher part of the mountains rises above the line of trees, but does not attain the snow-line.

The Thüringerwald, which is at the south-western extremity of this part of Prussia, is a mountain-range nearly fifty miles long, but only from eight to twelve miles wide. The mean elevation may be 2000 feet above the sea, and the highest summit, the Great Beerberg, is 3258 feet. A very small part of this range lies within the boundary of Prussia. The Harz is about fifty miles distant from the Thüringerwald on the north. The western and higher portion of this mountain-system lies within the kingdom of Hanover. Only the eastern and lower portion belongs to Prussia: in this part the range attains an elevation of about 1500 feet. The Brocken, which is 3729 feet high, stands near the point where the boundary-line between Hanover and Prussia runs across the range. The greater part of the country which lies between the Thüringerwald and the Harz belongs to Prussia; its general level may be about 900 feet above the sea, but some hills rise several hundred feet higher. The soil of the valleys, most of which are wide, is generally of excellent quality.

The great plain is not a dead level, like some parts of the interior of Russia, but the surface is diversified by several moderate elevations. Two of these traverse this portion of Prussia from east to west in its whole extent. The northern elevation runs generally parallel to the Baltic, and the southern in its eastern portion parallel to the Sudetes. The northern elevation is a portion of that high ground which extends eastward from the mouth of the river Elbe, at a varying distance from the Baltic, to the sources of the river Volga, through a space of more than 1000 miles. It is remarkable for the number of lakes dispersed over its broad surface and on the upper part of its slopes, and for the quantity of erratic blocks of granite which are imbedded in the surface. On the eastern boundary of Prussia it occurs near 54° N. lat., and it runs near its southern boundary between 23° and 19° E. long., but is comprehended within the territories of Prussia. The mean height of this part of the elevated ground may be about 450 feet above the sea-level, and the lakes are more numerous than in any other part of it, and some are of considerable extent. The lake of Spirding occupies an area of more than twenty square miles, and is nearly 400 feet above the sea-level; the lake of Mauer is nearly as large, and about 410 feet above the sea. The larger lakes taken together occupy a surface of 312 square miles, and the smaller lakes are very numerous. The soil is sterile, chiefly consisting of loose sand, covered in many places with heath, and in others with stunted pines. The portion of cultivable land is very small; that which supplies indifferent pasture for cattle and sheep is not much larger.

From this elevation the country slopes to the shores of the Baltic with an undulating surface, which is seldom varied by a hill. The soil improves as we advance northward, and as we approach the shores of the Frisches Haff and the banks of the rivers Pregel and Niemen it contains extensive tracts of great fertility. The most productive parts occur along the banks of the Niemen and Vistula, where the low river-bottoms are of great extent, and are protected against the inundations by embankments. The embankments were erected along the Vistula, more than six hundred years ago, by the Teutonic knights: they are above 150 miles long. The country which is thus secured from inundations contains an area of nearly 750 square miles, and is by far the most fertile tract in the Prussian monarchy.

The elevation is interrupted by the wide valley of the Vistula, and on the west side of the river it does not rise opposite to the termination of the eastern portion, but much farther to the north. It begins about twenty-five miles south-west of Danzig, with a rather steep ascent, and attains its greatest elevation in the Thurmberg near Schönberg, which is nearly 1070 feet above the sea, and is the highest hill between the Harz and the Ural mountains. From this place it extends in a south-western direction towards Behrendt, and thence to Märkisch Friedland, which is on the boundary-line between Prussia Proper and Pomerania. So far it resembles in all its features a mountain-system of a diminutive size. It continues with a less elevation and more extended slopes along the boundary-line between the provinces of Pomerania and Brandenburg, and terminates in abrupt hills not far from the banks of the Oder opposite Schwedt and Oderberg. The soil of this elevation is much better in this part than it is farther east, but it is only of very moderate fertility. To the south-east of the higher portion of the elevation extends the greatest waste in the Prussian monarchy, called the Tucheler Heide (Heath of Tuchel), which is fifty miles in length and from twenty to twenty-five in width. The soil is sandy, and with the exception of shrubs and stunted pines, it produces scarcely anything which is useful to man. The spots of cultivable ground are few and of small extent. Towards the south, where it approaches the river Netze, an affluent of the Warta, the soil improves, and it is still better between the two last-mentioned rivers, but even here the fertility is not great. Between the Warta, where that river runs north, and the Vistula, there is a large tract of country which yields abundant crops of wheat and other grain. The tract which extends along the lower course of the Warta to the banks of the river Oder, is much less fertile. On the northern side of the elevation the country is of moderate fertility, but it improves as we approach the shores of the Baltic. A few miles from the sea there is a tract several miles wide, which may be called fertile, but the shores consist of sand-hills which extend two or three miles inland, and occupy the whole coast from the eastern mouth of the Oder to the fertile delta of the Vistula near Danzig.

The Western portion of the elevation begins on the west of the Oder, between Schwedt and Oderberg, and runs west-north-west until it enters the duchy of Mecklenburg, through which it extends to Holstein and the banks of the Elbe. Its mean height is here probably less than 300 feet above the sea-level, and the surface is rather uneven, several hills rising from 100 to 200 feet above it. The soil of the part which is within Prussia is of moderate fertility; but along its northern declivity, and as far as the shores of the Baltic, including the island of Rügen, it consists of very good land, which yields large crops of grain.

The Southern elevation of the Prussian plain is connected at its eastern extremity with the mountains of Sandomir in Poland [POLAND], and with those surrounding the mining town of Olkusz, north-east of Cracow. From this point it runs in a west-north-west direction along the eastern boundary-line of the province of Silesia, where it rises to about 1000 feet above the sea-level north of the town of Breslau. In this part it is called the Heights of Trebnitz. The elevation is interrupted by the valley of the Oder between Leubus and Great Glogau, and farther on by the Bober, Neisse, and Spree; but it appears south of Berlin, where it is called the Fleming, and is 400 feet above the sea, or 300 feet above the site of the Prussian capital. It terminates not far from the banks of the Elbe, between Magdeburg and Burg; but a continuation of it appears on the western side of the Elbe and after leaving the Prussian dominions, continues between the Elbe and the Weser to the vicinity of the North Sea, between the mouths of these two rivers. In these parts it is very wide, and comprehends the Heath of Lüneburg, which belongs to the kingdom of Hanover.

The country which lies between the two elevations, west of the meridian of 15°, is not distinguished by fertility, except in some of the river bottoms. Berlin lies in a sandy desert, which contains only small isolated tracts of fertile ground; and this sterile country, in some parts overgrown with fine forests, extends northward to the boundary-line of Mecklenburg, and southward to the Fleming. To the east and west of this waste, on both sides of the river Oder, and towards the banks of the Elbe, the country is much better, but still not very fertile.

The country to the south of the southern elevation is more favoured by nature than the other parts of the Prussian monarchy. Completely sterile tracts are rare, and of small extent, with the exception of one which forms the southern district of Silesia, and is contiguous to the boundary-lines of the Austrian dominions and of Poland. The remainder of Silesia is fertile, especially the plain, which extends on the left bank of the Oder from Oppeln to Liegnitz. The same observation applies to the province of Saxony, as far as it lies south of the southern elevation; the country about the town of Magdeburg is noted for its fertility, and is considered the granary of Berlin.

Climate.—Numerous meteorological observations have been made in all parts of the Prussian monarchy, and their results have been compared. The difference of temperature in the provinces is considerable. Berghaus has divided Prussia, as to climate, into three sections, the western, central, and eastern divisions. The first is formed by Rhenish Prussia, and the last by Prussia Proper; the remainder of the monarchy constitutes the central division. He gives the following table:—

	Latitude.	Elevation above the Sea-level.	Mean Temperature of Fahrenheit.				
			Of the Year.	Of the Summer.	Of the Winter.	Coldest Month.	Warmest Month.
Western division	51°	feet. 220	49½°	63°	35°	33°	64°
Central division	52° 30′	210	48°	64°	31°	29°	66°
Eastern division	54° 40′	80	43°	61°	26°	24°	63½°

From this table it is evident that the difference of the mean temperature in winter in the western and eastern divisions amounts to nine degrees, but in summer it does not exceed two degrees and a half. If we compare the climate of these divisions with that of London, we find that the mean annual temperature of London is about one degree greater than that of the western division, and exceeds by nearly eight degrees that of the eastern. But as the mean temperature of the summer at London is only 61·2°, the western and central divisions of Prussia experience at that season a greater degree of heat than the British metropolis. The winter however in London is much milder, as the average temperature of this season is 39·2°. Berghaus observes, that the mean annual quantity of rain in the western division amounts to twenty inches, and only to fifteen inches in the eastern division, but it is nearly impossible to determine this point, as the latter division annually experiences very heavy falls of snow, which it is nearly impossible to estimate, on account of the drift-storms, which accumulate the snow in some places to a great depth, whilst other places, which are exposed to their whole force, are quite bare. The prevailing winds in Prussia, as all over the west of Europe, blow from the west, and frequently with great force.

Rivers.—In Rhenish Prussia is the Rhine, which traverses that division of the monarchy from south to north, and is navigable for large vessels as far as it flows through the Prussian dominions. As far as Cologne (Köln) it may be ascended by sea vessels of moderate size. Its course above Bonn is rapid, and in some places eddies occur, but they are not dangerous. Several rivers join the Rhine from the east and west. From the east it receives the Sieg, on which timber is floated, and which is also navigable for four or five miles from its mouth; the Wipper, farther north, which is only navigable for a short distance from its mouth; and the Ruhr and the Lippe, both of which are navigable for 30 or 40 miles from their junction with the Rhine. On the left the Moselle falls into the Rhine, and is navigable in the whole of its course through the Prussian dominions, an extent of more than 150 miles.

In the eastern provinces of Prussia four large rivers, the Elbe, Oder, Vistula, and the Niemen, traverse the elevations which run through them from east to west. Between the two elevations however the affluents of these rivers run east and west, and as many of them are navigable for river boats, they facilitate the intercourse between the countries on their banks. The navigable affluents of the Elbe, from the west, are the Saale, which begins to be navigable where it enters Prussia, the Unstrut, and the Elster; and from the east, the Havel, which is joined by the Spree; the course of the Havel is nearly 250 miles, measured along the windings, and it is navigable for about two-thirds of that distance. The navigable affluents of the Oder from the east are the Klodnitz, in southern Silesia; the Bartsch, which is navigable from Militsch downwards; the Warta, which is navigable before it leaves Poland and enters Prussia, with its navigable tributary the Netze; and from the west, the Bober, the Neisse, and the Finow. The lake into which the Oder discharges its waters before it enters the Baltic, receives the two navigable rivers, the Ucker and the Peene; by the latter sea vessels of moderate size can ascend to the town of Demmin. The Vistula receives from the west the Brahe, which becomes navigable at the town of Bromberg. Between the Oder and the Vistula is the Persante, which runs more than 100 miles, and is navigable more than 20 miles from its mouth in the Baltic. The Elbing river rises in the lake of Drausen, and though its course is not long, it is navigable, and of great importance to the town of Elbing; it falls into the Frisches Haff. Farther east the same lake receives the Passarge, which is navigable for small sea vessels to the town of Braunsberg, four miles from its mouth. The Pregel, which also falls into the Frisches Haff, is navigable as far as Insterburg for large river vessels, and to the town of Königsberg for vessels of 300 tons burden. A river, which is united with the Pregel by a canal, runs to the Kurisches Haff; it is navigable for large river boats, and called the Deime. The Niemen or Memel is navigable in the whole of its course through Prussia; it receives from the north the river Yura, which about ten miles from its mouth is navigable for small river boats; and from the south the Scheschuppe, which is navigable about 25 miles upwards. The last river which requires mention is the Dange, which comes from Russia, and enters the Kurisches Haff at its most northern extremity, where it forms a part of the harbour of the town of Memel. Vessels of more than 500 tons burden can enter the river and unload in the middle of the town.

Natural Productions.—Prussia does not possess a great variety of natural productions, but it has all those the cultivation of which has been gradually introduced into central Europe, and the most indispensable of them in sufficient abundance for its own consumption, and for the obtaining of foreign luxuries and comforts. Of domestic animals, according to the latest accounts that we have seen, and which appear to have been published about six years ago, there are—horses 1,500,000, the breed of which has been much improved of late years, especially in the eastern provinces, by numerous studs; horned cattle 473,180; sheep, at least 12,650,000 in round numbers, viz. 2,600,000 Merinos, 5,450,000 of an improved breed, and 4,600,000 not improved; goats, 200,000, are bred only in the mountainous parts of Silesia, Saxony, and Westphalia; swine, 2,000,000, are chiefly bred in Pomerania, Saxony, the provinces of the Rhine, and above all in Westphalia, the hams of which country have long been celebrated. There are likewise asses, chiefly in Westphalia, and mules. Of wild four-footed animals there are: 1, fit for food—stags, fallow-deer, wild boars, hares, and rabbits. The great northern hare is sometimes met with. 2, Beasts of prey and fur-bearing animals—wolves, foxes in abundance, bears rarely, lynxes, beavers, badgers, pole-cats, otters, weasels, and martens; the ermine is very rare. Domestic poultry of all kinds abounds; and of wild-fowl, besides what we call game, as pheasants and partridges, there are such immense numbers of wild geese as frequently to do great injury to the farmers. Smoked geese are an important article of exportation from Pomerania. Of birds of prey, there are the eagle, the sparrow-hawk, the kite, and some others. Fish of various kinds are extremely abundant, as well in the numerous rivers as on the long line of coast on the Baltic. In all the provinces where there are heaths, buckwheat, and lime-trees, great quantities of bees are bred, in all 600,000 hives. The breeding of silkworms has been greatly increased within the last twenty years, and promises to become very important.

Agriculture.—Agriculture is the chief source of the national wealth, and is carried on with great care in most of the provinces. Wheat, rye, oats, and barley are raised both for home consumption and exportation; there are likewise peas, beans, vetches, millet, maize, rapeseed, and linseed. Potatoes are cultivated in all the provinces. Flax, hemp, hops, tobacco, succory, beet-root, and garden vegetables of all kinds are raised; but of the first three articles not enough for home consumption. Fruit might be more extensively cultivated than it is. Considerable pains are taken with it in Pomerania; but the most productive provinces are Saxony and Rhenish Prussia. The cultivation of the vine has been greatly extended since the peace of 1815. The most and best wine is made in Rhenish Prussia; of 55,000 acres of vineyards, 44,000 are in that province. On the whole Prussia has abundance of timber: the principal forests are in Prussia proper and Silesia; but some provinces, for instance part of Saxony, have not sufficient. The mineral products are salt from salt-springs, of excellent quality and in great abundance, amber, and coals in large quantities; alum, vitriol, saltpetre, alabaster, basalt, granite, porphyry, marble, slate, freestone, chalk, lime, porcelain-clay, pipe-clay, &c. The metallic products are silver, copper, lead, iron, zinc, cobalt, arsenic, and calamine. The precious stones are the onyx, agate, jasper, and cornelian.

Manufactures.—The principal manufactures are:—linen in all the provinces, but chiefly in Silesia; woollen cloths and cotton goods, especially in the province of the Rhine, at Elberfeld, Barmen, Crefeld, &c.; silk, leather, iron and copper ware, cutlery, articles of gold and silver, succory, paper, china, glass, earthenware, snuff and tobacco, sugar (the manufacture of beet-root sugar is making great progress), gunpowder, &c.; the breweries and brandy distilleries are very considerable.

Commerce.—The abundance of products of various kinds, and the active industry of the people, give occasion to an extensive commerce, which is highly favoured by the advantageous position of the country in the centre of Europe, the great extent of coast on the Baltic, and by the great rivers (the Rhine, the Elbe, the Oder, and the Vistula) which traverse the country and are connected by navigable tributary streams and numerous canals. The commerce of Prussia extends to almost all the states of Europe, to America, and even to China; but its chief commerce is with Austria and the other states of Germany, with England, Russia, Sweden, Denmark, and the Netherlands. The principal articles of export are the natural productions and the most important of the manufactures enumerated under the two preceding heads. The chief articles imported are:—raw and refined sugar, coffee, tea, spices, cotton, silk, tobacco, hops, tin, saltpetre, dye stuff, wine, glass, and various manufactures, chiefly printed calicoes, silks, and fine hardware. It is not easy to ascertain the annual value of the exports and imports previously to 1831. That of the imports, says Dieterici, cannot be less than from ten to twelve millions sterling. The exports seem to have exceeded that sum. In 1831 the celebrated Prussian or German commercial league commenced, and has been since been gradually joined by almost all the German states. The effect of this league (or, as it is called in German, Zollverein, *i.e.* customs union) is not yet fully developed. The object is to establish an entire freedom of trade among the German states, and to subject foreign trade to such restrictions only as the protection of national manufactures or the financial circumstances of the state may render necessary. The result in the years 1831-1836 has been published, from official sources, by Dr. Dieterici, in a very elaborate work, in 1838. The harbours are:—Memel, Pillau, Neufahrwasser near Danzig, Stolpermünde, Rügenwalde, Kammin, Schweinemünde, Peenemünde, Greifswald, Stralsund, and Barth. The most considerable commercial towns are:—Berlin, Königsberg, Danzig, Breslau, Stettin, Magdeburg, Cologne, Elberfeld, and Aix-la-Chapelle. The great fairs are those of Breslau, Frankfurt-on-the-Oder, and Magdeburg.

Religion.—There is, properly speaking, no state religion That of the royal family and of the majority of the people is Calvinism; but Christians of all denominations are equally admissible to all public employments. The year 1817, which was the three hundredth anniversary of the Reformation, was remarkable for the union of the Calvinists and Lutherans in Prussia, and in some other parts of Germany, into one religious body, under the name of Evangelical Christians. These amount in Prussia to about 8,000,000, the Roman Catholics to about 5,000,000, the Mennonites and Moravians to about 15,000: there are likewise French Protestants, the descendants of the refugees; and nearly 200,000 Jews.

Education.—The Prussian government pays great attention to the diffusion of useful knowledge, and manifests equal zeal in encouraging the lowest as well as the superior institutions. For the education of the people, there are in all the towns elementary schools, Sunday and infant schools, schools for mechanics, &c.; in fact, so much is done in this respect, that many persons complain of the too great extent and variety of things taught in these institutions. In 1835 there were 21,790 elementary schools, in which about 2,000,000 of children of both sexes were instructed. For the higher branches of education, there were, in 18[illegible], 124 gymnasia, in which 24,461 scholars were educated. There are universities at Berlin, Bonn, Breslau, Greifswald, Halle, and Königsberg, to the support of which the government applies large sums. As to education generally in Prussia, see SCHOOL. The literary and learned societies are very numerous.

Revenue.—In the year 1835 the revenue amounted to nearly 8,000,000*l.* sterling, and has not much varied since that time. The expenditure for the same year was estimated at an equal sum, of which about 1,200,000*l.* was appropriated to pay the interest of the public debt, and to the gradual redemption of it, and above 3,000,000*l.* to the war department. The debt amounted, on the 1st January, 183[illegible], to about 27,000,000*l.* sterling, bearing interest at 4 per cent.

Army.—All subjects of the Prussian monarchy are bound to military service, which they perform successively in the standing army, the landwehr (militia) of the first and second ban, and in the landsturm (which answers to the French *levée en masse*). All men able to bear arms from twenty to twenty-five years of age belong to the standing army; they serve three years, and are then discharged for two years, during which they are liable to be called out as the reserve. All those who have served in the standing army belong to the landwehr of the first ban, from the age of twenty-six to thirty-two, both inclusive. In time of war this ban is on the same footing as the standing army, and equally liable to serve both at home and abroad. It is called out every year to exercise, in one year for a fortnight, in the next for a month, and is equipped and clothed while it serves. The second ban, which is called out only in time of war, and is then chiefly employed in reinforcing the garrisons, includes all men capable of bearing arms till the age of thirty-nine. All older men fit for service belong to the landsturm. The army consists of eight corps, besides the guards, amounting to—

Besides—			
Landwehr of the first ban:			
Infantry . . .	2,658	118,481	
Cavalry. . . .	918	20,400	

The 6400 invalids are not included. Thus Prussia is in time of war to have on foot an army of 8787 officers and 319,313 men; and, with the addition of the second ban of the landwehr, amounting to 180,000 (destined only to defend the country within the frontiers), a force of 500,000 [illegible]. The state maintains likewise several bodies of gendarmes. There are six fortresses in the western and twenty in the eastern provinces. The Duke of Wellington is the only field marshal in the Prussian army.

The whole Prussian monarchy is divided into eight provinces, and these into twenty-five governments.

The following table shows the extent of the whole Prussian monarchy, the population of the provinces and governments, the number of inhabitants in a German geographical square mile (equal to about twenty-one English square miles), the principal towns, and the population, according to the return of 1837, the latest published:—

View of the Area and the Population of the Prussian Monarchy at the end of 1837.

Provinces.	Governments.	Area in German Square Miles.	Population at the end of 1837.	Inhabitants on a Square Mile.	Towns with more than 5000 Inhabitants. Names of the Towns.	Population.

The Constitution is an unlimited monarchy, hereditary in the male and female line. Prussia had formerly a representative body called the Estates. In process of time the power of the crown increased, and the government was carried on without the intervention of the estates, which fell into disuse. After the conclusion of the wars of the Revolution, the late king Frederic William III. issued, on the 22nd of May, 1815, an ordinance which promised that each province should have its own estates; and it was understood that at a subsequent time there should be a general representation of the whole kingdom. Accordingly, in July, 1823, a law was promulgated for the institution of provincial estates, which have been since regularly convoked in all the provinces; but the king did not take any steps towards the institution of a general national representation. On the accession of the present king Frederic William IV., it seems to have been expected that he would fulfil what were understood to have been his father's intentions, and while he was at Königsberg, in Sept. 1840, to receive the homage of the estates of the province of Prussia, that assembly resolved, by a great majority, to insert in their address to his majesty a clause reminding him of the ordinance of 22nd May, 1815, and requesting him to fulfil the promise of a national representation. The king, however, in his answer declares, that his father, soon after the issuing of that ordinance, was induced by the events that took place in other countries, to take into serious consideration the meaning that might be given to his words; that reflecting on the sacred duties of the royal office confided to him by God, he resolved to fulfil his promises, but keeping aloof from the prevalent notion of a general national representation, he should follow, for the real good of the people committed to his care, and with the sincerest conviction, the most natural course, and which, conformably to historical tradition, was the best adapted to the German national character. The result was the establishment of provincial and district assemblies in all parts of the monarchy.

Prussia as a member of the German Confederation, is the second in rank; its contingent to the army is 79,234 men, viz. 55,257 infantry of the line, 3071 light infantry, 11,319 cavalry, 5978 artillery and train with 160 pieces of cannon, 922 pioneers and pontooners. This contingent, which forms the 4th, 5th, and 6th corps of the army, is for the German provinces; Posen and Prussia being no part of the Confederation. It contributes 5000 florins per annum to the expenses of the Diet; and in the full council has, like the other kings, four votes.

History.—The history of Prussia is brought down to the latter end of the eighteenth century, in the articles BRANDENBURG and FREDERICK WILLIAM the Great Elector, and his successors, to the end of the reign of Frederic William II. His son Frederic William III. ascended the throne on the 16th of November, 1797, and immediately commenced a general reform in the administration, which was very much needed. In the war of the European powers against France, he maintained a neutrality as stipulated in the treaty of Basle, in 1795, and profited by this season of peace to promote the prosperity of the people, and especially to introduce economy into the public expenditure. Peace being concluded at Luneville, in 1801, by which the left bank of the Rhine was ceded to France, Prussia obtained by the decision of the diet of the Empire in 1803 an accession of territory of nearly 4000 English square miles, with above 400,000 inhabitants. In the war of the third coalition against France, which broke out in 1805, Prussia still preserved its neutrality; but the unexpected march of a French and Bavarian army through part of the Prussian territory, and a visit of the emperor Alexander to Berlin, induced the king secretly to join the coalition against France, on the 5th of November, 1805, upon certain conditions. After the battle of Austerlitz, peace was concluded between Austria and France. A few days before, on the 15th of December, 1805, the Prussian ambassador, Count Haugwitz, concluded a preliminary convention between Prussia and France, by which Prussia ceded Anspach to Bavaria, and Cleves and Neufchâtel to France, which made over the electorate of Hanover to Prussia, and Prussia in fact took possession of that country. This led to a declaration of war by England against Prussia. Various negotiations followed, which ended in a war between Prussia, in alliance with Saxony, and France. Hostilities began on the 9th of October, on the Saale, and on the following day the advanced guard of the Prussian army was repulsed at Saalfeld, on which occasion the brave Prince Louis of Prussia was killed. The battles of Jena and Auerstadt, on the 14th October, decided the fate of the Prussian army. The most important fortresses between the Weser and the Elbe surrendered in rapid succession, and Napoleon entered Berlin on the 27th of October. Frederic William retired to Memel, collected a new army, and, together with his ally the emperor of Russia, marched to oppose the advance of the enemy in East Prussia. The battles of Eylau and Friedland led to the peace of Tilsit, 9th July, 1807, by which the king lost half of his dominions, and the French troops continued to occupy the other half. The French did not evacuate Berlin till December, 1808, so that the king could not return to his capital till the end of 1809. Frederic William now laboured with incessant zeal and firmness to heal the wounds which war had inflicted, and to give an entirely new form to the internal administration. The army was reduced to 42,000 men.

In December, 1808, accompanied by his queen, he went to St. Petersburg to confirm his alliance with the emperor Alexander. After a stay of some weeks, he returned to Königsberg, and on the 23rd December, 1809, made his entry into Berlin. But the joy of the king and of the people was damped by the unexpected death of the queen Louisa, on the 19th July, 1810. On the 24th February, 1812, he concluded an offensive alliance with France, and when war broke out between Russia and France, in June, 1812, he sent 30,000 men to join the 10th French corps under Marshal Macdonald, which was employed in the siege of Riga. On the rapid retreat of the French from Russia, the Prussian corps was likewise obliged to retire, but General York, who commanded it, concluded a convention with the Russian general Diebitsch, by which the Prussian corps was declared neutral and separated from the French army. The Prussian people now began to entertain hopes of seeing their country delivered from the yoke under which it had so long suffered, when the king called the nation to arms. The enthusiasm with which this call was answered enabled the king to bring into the field, in 1813, a numerous and well-disciplined army. The campaign of 1813, the advance of the allies to Paris, the capture of that city in March, 1814, the deposition of Napoleon, his removal to the island of Elba, and the restoration of the Bourbons, followed in rapid succession. After the conclusion of the peace of Paris, the king of Prussia visited London in company with the emperor Alexander, in June, 1814, and he afterwards attended at the congress at Vienna. The return of Napoleon from Elba in 1815 led to a new alliance between Prussia, Austria, Russia, and England, who declared war against him. The battle of Waterloo led to the general peace of Europe, which has not since been interrupted. Frederic William continued till his death, on the 7th June, 1840, to devote all his attention to improve the manufactures, commerce, and administration of his dominions: the most important transaction of his reign was the conclusion of the commercial league of which we have already spoken.

PRUSSIA, properly so called, formerly designated by the name of the Kingdom of Prussia, and afterwards divided into the two provinces of East and West Prussia, now forms only one province, which is called the Province of Prussia. It is situated between 52° 54′ and 55° 53′ N. lat. and between 16° 42′ and 22° 45′ E. long. It is bounded on the north by the Baltic, which washes the coast for about 270 miles, on the east by Russia, on the south by the kingdom of Poland and the province of Posen, and on the west by Brandenburg and Pomerania. Its area is 24,780 English square miles, of which 800 are water, and the population is 2,152,873. The climate is temperate and healthy, though very cold in winter, very changeable on the coast, and generally rather damp. The face of the country is level, broken here and there by low ranges of hills. The forests which cover the sandy plains are estimated at two millions of acres. The principal rivers are the Vistula, the Pregel, and the Memel, or Niemen. There are some hundreds of small lakes, namely, 300 in East and 150 in West Prussia; but no large ones, unless we reckon as such the two Haffs, which communicate with the sea only by canals, and have fresh water. [Curisches Haff; Frisches Haff.] Of the smaller ones, M. Preuss names 34 of various sizes, from 5 to 10 or 15 square miles in extent; the two largest are the Mauer lake, 40 square miles, and the Spirding lake, 70 square miles in extent. With regard to the natural productions, the province produces corn, pulse, flax of excellent quality, hemp, tobacco, hops, madder, potatoes, and timber. There are good breeds of the usual domestic animals, abundance both of fresh-water and sea fish, and bees. The mineral kingdom is very poor; iron however, in various forms, is abundant, and that singular production amber is far more plentiful in this province than in any other part of the world. [Amber.] We extract a few particulars from the journey of Messrs. A. von Humboldt, Ehrenberg, and Rose, performed in the year 1829. 'Formerly the collection of amber was under the direction of persons appointed by the government. As much the larger portion is cast up by the sea, and it is therefore easy for the inhabitants of the coast, especially fishermen, to collect it on their own account, they are subject to very annoying restrictions; they cannot enjoy an aquatic excursion without subjecting themselves to a strict search by the officers appointed for the purpose; they can put to sea from certain places only, and if they are found elsewhere, they are liable to be sent to Königsberg or Fischhausen, which, even if they should be found innocent, causes a loss of one or more days. These considerations induced the government of Königsberg, in 1809, to propose to the inhabitants to farm the amber, but the negotiation failing, the right of collecting amber was farmed in 1811 to a Mr. Douglas for 10,000 dollars per annum. Mr. Douglas showed our travellers his warehouse, which, on account of the inflammable quality of the amber, is made fire-proof and closed with massy iron doors. There were at that time 150,000 pounds in the warehouse. This was a larger stock than usual, because the demand from Constantinople, which is the chief market, was much diminished, partly by the wars in which the Porte was engaged, partly by the ordinances of the Sultan to restrict luxury. Mr. Douglas had farmed only the collection from Memel to the territory of Danzig; that which is collected about Danzig is farmed by the city itself. It is remarkable that the quantity of amber collected annually has always remained the same, as appears on examining the accounts from 1531 to 1811.' The manufactures of the province are confined to the towns, of which the principal are Danzig, Elbing, and Königsberg. The commerce of the province has greatly declined in comparison with its once flourishing state, as the many great warehouses that stand empty in all the ports afford a melancholy proof. The rigorous prohibitory system of Russia is the chief if not the only cause of this decline.

After the Goths left the shores of the Baltic, they were succeeded by different Sclavonian tribes. Conrad, duke of Masovia, being unable to defend his country against these mercenaries, called to his assistance the Teutonic knights, to whom he assigned, in 1230, a tract of land on the Vistula, where they built Thorn and Culm. The power of the Order gradually increased; their territory became very rich and flourishing; but the heavy war-taxes and the prodigal magnificence of the knights caused the nobles and the great towns to put themselves under the protection of Poland, and, by a treaty concluded at Thorn in 1466, West Prussia was ceded to Poland, retaining however its own constitution. The German empire, to which the territory of the Order was considered to belong, refused to recognise the treaty of Thorn, and the knights, who retained possession of East Prussia, refused to do homage to the king of Poland, and chose Albert of Brandenburg, son of the margrave Frederic the Elder, of Anspach and Baireuth, for their grand-master, hoping by the help of his house to be able to throw off their vassalage to Poland. But the German empire did nothing, and on the peace of 1525 the Prussian territory of the Order was accepted by the prince for himself and for his own and his brother's male descendants as a fief dependent on Poland, under the title of a grand-duchy. Albert being a Protestant, the Reformation spread over the whole province.

PRUSSIC ACID. [Hydrocyanic Acid.]

PRUTENIC TABLES. [Reinhold, Erasmus.]

PRUTH, a large navigable river in the Carpathian mountains, in the circle of Stanislawow. It flows for about 30 miles to the north, and then to the east through the Buckowina into Moldavia. From the point at which it leaves the Buckowina, it has formed for the whole remainder of its course, since the peace concluded at Bucharest in 1812, the boundary between Russian and Turkish Moldavia. After a course of about 500 miles it falls into the Danube below Galacz. It is remarkable in history for the narrow escape of Peter the Great in 1711, who was here completely surrounded by the Turks and Tartars near Falezyn. He was happily extricated from his dangerous situation by the address of his consort Catherine I., who, seconded by field-marshal Scherematoff, made proposals of peace to the grand-vizir, supported, it is said, by powerful arguments in the shape of presents of money and jewels. Peace was concluded on the 22nd of July, 1711, by which Peter obtained his own deliverance and that of his army by the cession of Azoff and some other places.

The Pruth is the Porata (Πόρατα) of Herodotus (iv. 48).

PRYNNE, WILLIAM, an eminent compiler of records, and a distinguished political character in the reign of Charles I. and during the Commonwealth, was born in the year 1600, at Swainswick near Bath, and received his early education in the grammar-school of that city. He became a commoner of Oriel in 1616, and took his bachelor's degree at Oxford in 1620. Soon after taking his degree, he removed to Lincoln's Inn, in which Society he was called to the bar, and subsequently became bencher and reader. His name scarcely appears in the Law Reports of his time, and he never practised at the bar to any considerable extent. He applied himself much to the study of controversial divinity, and became a devoted follower of the well known Puritan divine Dr. John Preston, who was at that time lecturer at Lincoln's Inn. In accordance with the doctrines of the Puritans respecting church government, he published, soon after he came to Lincoln's Inn, several tracts against Arminianism and prelatical jurisdiction, by which, as well as by promoting and encouraging motions in the superior courts for prohibitions to the High Commission Court, he greatly exasperated Archbishop Laud and the clergy against him. In the year 1632 he published a virulent pamphlet called 'Histrio-Mastix, or a Scourge for Stage Players,' in which he denounced in coarse and scurrilous language the prevailing fashion of the day for masques, interludes, and other similar entertainments. Amusements of this kind being the favourite recreation of the court (the queen herself having performed in a Pastoral at Somerset-house), Prynne's book gave great offence, and the attorney-general prosecuted him for it in the Star-Chamber. The court fined him 5000*l.*, ordered him to be expelled from the university of Oxford and the Society of Lincoln's Inn, and degraded from the bar, to be set twice on the pillory, and to lose both his ears, to have his book burned by the common hangman, and to be imprisoned for life. In conformity with this sentence, he was formally degraded in the university of Oxford, in April, 1634, and his named erased from the lists. Three years afterwards, while imprisoned in the Tower under the above sentence, he published another pamphlet, entitled 'News from Ipswich,' reflecting severely upon the hierarchy generally, and upon Laud and several of the bishops in particular. For this publication he was again prosecuted in the Star-Chamber, and sentenced to pay a fine of 5000*l.*, to be set on the pillory, to be branded on both cheeks with the letters S. and L. (Seditious Libeller), to lose the remainder of his ears, and to be closely imprisoned for life in Caernarvon Castle. These outrageous sentences were rigidly executed; and the usual consequence of undue severity appeared in the popular sympathy and party spirit which it excited. The Puritan friends of Prynne flocked to Caernarvon Castle in such numbers, that it was thought necessary to change the scene of his confinement; and after he had been at Caernarvon about ten weeks, he was illegally removed by a warrant from the lords of the council to the castle of Mont Orgueil in the island of Jersey. Here he remained until the beginning of the Long Parliament in 1641, when, upon his petition to the House of Commons, he was released by a warrant from the Speaker, and resolutions were passed declaring both the sentences against him in the Star-Chamber to be contrary to law. Clarendon and Anthony Wood describe the extraordinary demonstrations of popular feeling in his favour on his landing at Southampton and on his journey to London. (*History of the Rebellion*, vol. i., p. 163; *Athenæ Oxonienses*, vol. iii., p. 849.) Soon afterwards he was returned as a member of parliament for Newport in Cornwall, and about the same time was made a bencher at Lincoln's Inn. In 1643 he was employed with Clement Walker by the parliament to conduct the prosecution of Colonel Fiennes for cowardice in surrendering the city of Bristol, and seems to have been busily and cordially engaged in the proceedings of the Commons at that eventful crisis. Serjeant Hyde having been dismissed from his office of recorder of Bath, in consequence of the ordinances of parliament passed in September and October, 1647, Prynne was elected recorder by a considerable majority of the corporation. He took no part in the violent proceedings of the later years of the Long Parliament; and immediately before the king's trial he was ordered into the custody of the serjeant-at-arms for 'denying the supremacy of parliament' in a pamphlet entitled 'The Memento.' (Rushworth's *Collections*, vol. ii., p. 1399.) On the 6th of December he was arrested by the army, and, together with many of his party, ejected from the House of Commons. From this time he became a bitter enemy of Cromwell and the army party; and in consequence of his writings against them, was again imprisoned for several years at Dunster Castle in Somersetshire and Pendennis Castle in Cornwall. Being expressly disabled by parliament 'to officiate or be in any office concerning the administration of justice within the Commonwealth,' he was, in September, 1652, discharged from his office of recorder of Bath; to which however he was again elected shortly after the Restoration. (*Council Book of the Corporation of Bath.*) In the early part of the year 1660, having returned to his seat in the House of Commons as an excluded member, he is said, in a letter to General Monk (Winwood's *Memorials*, vol. iii.), to have 'exceedingly asserted the king's right,' but with so much of his characteristic bitterness and imprudence, that Monk sent for him and admonished him to be quiet. Upon the dissolution of the parliament, in March, 1660, he was elected to serve in the new parliament for the city of Bath.

Soon after the Restoration he was appointed keeper of the records in the Tower, an office for which his habits of study peculiarly fitted him, and which furnished him with the opportunity of compiling his laborious and useful collections respecting constitutional and parliamentary history. After this period, his pragmatical disposition again brought him into difficulty by the publication of a pamphlet against the proposal bill for regulating corporations. This paper, being considered by the House of Commons to be a seditious libel, he was reprimanded by the Speaker, and threatened with expulsion and prosecution; but upon his making a full confession and recantation, no proceedings were taken against him. He died in Lincoln's Inn, in October, 1669.

Prynne was a most laborious and voluminous writer. A catalogue of his works (which consist of nearly 200 volumes) is given, after an account of his life, in Wood's *Athenæ*, vol. iii., p. 844, edit. Bliss. They are justly characterised by Wood as displaying 'great industry, but little judgment.' The most useful among them are his 'Calendar of Parliamentary Writs,' and his 'Records.' The latter work, consisting of 3 vols. in *folio*, professed to illustrate and prove the supremacy of the kings of England in all ecclesiastical affairs within the realm, by records taken from the earliest periods of English history to the reign of Elizabeth, but the author did not live to carry his design farther than the reign of Henry III.

PRYTANIS (Πρύτανις), the name of the chief magistrate in many of the Grecian states. In some states the Prytanis had the superintendence of all matters relating to religion, thus corresponding to the king archon at Athens. (Compare Aristot., *Polit.*, vi. 5.) We read of this office in Corinth, Corcyra, Miletus, Tenedos, Pergamus, Cos, Rhodes, &c. (Wachsmuth, *Hellen. Alterth.*, i., p. 194.)

At Athens, the name of Prytanes (πρυτάνεις) was given to the members of the senate of five hundred, who acted as presidents of the senate and of the assemblies of the people. The senate of five hundred was divided into ten sections of fifty each, who were chosen respectively from the ten tribes into which the Athenian people was divided. Each tribe presided in turn during 35 or 36 days, as the case might be, so as to complete the lunar year of 354 days ($12 \times 29\frac{1}{2}$). Their period of office was called a prytany (πρυτανεία). As however fifty was too large a number to conduct business conveniently, every fifty was divided into five bodies of ten each, who presided for seven days over the rest, and were therefore called proëdri (πρόεδροι); and from these proëdri an ἐπιστάτης was chosen for one day to preside as chairman in the senate and the assembly of the people; during his day of office he was entrusted with the keys of the treasury and archive office, and with the state seal.

The prytanes had a building to hold their meetings in, where they were entertained at the public expense during their prytany. This building was called the Prytaneion (πρυτανεῖον), and was used for a variety of purposes. (Hermann, *Political Antiquities of Greece*, § 127.)

PRZEMYSL is a circle in the Austrian kingdom of Galicia, about 2000 square miles in extent, with a population of 240,000 inhabitants, of whom about 14,000 are Jews. The surface is level: the country contains extensive forests, and is watered by the Save, or Sau, and some smaller rivers: the soil is fertile, and produces corn, hemp, flax, and potatoes; the breeding of cattle is carried on to a great extent. Next to agriculture, the chief employment of the inhabitants is linen-weaving.

PRZEMYSL, the capital of the circle, situated in 49° 46′ N. lat. and 23° E. long., is an old and tolerably well built town on the right bank of the Save, over which there is a handsome bridge 500 feet long. It is surrounded with a rampart, and on a neighbouring eminence are the remains of an antient castle. There are in the town two cathedrals, 14 Roman Catholic and Greek United churches, a convent of Benedictine nuns, a gymnasium, and several schools. Both a Greek United bishop and a Roman Catholic bishop reside here, the latter being under the archbishop of Limberg. The inhabitants, in number 7800, manufacture leather, linen, and wooden-ware, in which they carry on a considerable trade.

PSALMANAZAR, GEORGE, was born about 1679. All that we know of his early history is from his own memoirs, which were published after his death, but they do not tell us his true name nor that of his native country, though it is generally believed that he was a native of the south of France. (*Memoirs of ...., commonly known by the name of George Psalmanazar, a reputed native of Formosa, written by himself*, London, 1765.) He was in his youth a wandering adventurer. Sometimes he gave himself out for a Japanese, and at others for a native of the island of Formosa: at one time professing to be a convert to Christianity, and at others to be still a heathen. He travelled over several parts of Europe, France, Germany, and the Netherlands; was a soldier, a beggar, a menial, a preceptor, a man of all trades, and came at last to England, where he continued for several years to act the part of an impostor, and published a fabulous account of the island of Formosa, which imposed upon the credulity of the public. His natural abilities and a certain degree of information gained him several influential friends. At last, when about thirty-two years of age, a moral change took place in him; he grew ashamed of his dishonourable courses, became open to religious conviction, and determined to reform. He applied himself intensely to study, and after a time became engaged in literary pursuits, by which he earned an honest subsistence and considerable reputation during the rest of his life. He died in London, in 1753. He wrote, for the large work styled the 'Universal History,' most of the parts concerning antient history, except that of Rome, and his writings met with great success. He also wrote a volume of Essays on several scriptural subjects, a version of the Psalms, besides his own memoirs already mentioned. He also wrote, for the 'Complete System of Geography,' 1747, an article on the island of Formosa, founded upon authentic information, as a reparation for the stories which he had palmed upon the public in his former account. Psalmanazar is the name that he had assumed when he began his wandering life, and which he retained till his death.

PSALMODY, in its widest sense, signifies the Psalms of David set to music and sung. But from the early part of the sixteenth century the term has been applied only to metrical versions of the Psalms to which short grave airs are either set or adapted.

The practice of psalm-singing may be traced to a very remote date, but we need not refer to any period anterior to that of our Saviour. In St. Matthew's and St. Mark's gospels (xxvi. 30; xix. 26), we find that, after the last supper, Christ and his disciples 'Sung an hymn' ('*or psalm*,' says the marginal note), previously to their going 'out into the Mount of Olives.' St. Paul exhorts the Ephesians (v. 19) to sing 'psalms and spiritual songs;' and St. James (v. 13) recommends those who are 'merry' to do the like. The corroborative passage in the letter of the younger Pliny to Trajan (*Ep.*, x. 97) stating that the Christians sang hymns to their Christ before daybreak, is well known. The bishops Flavianus and Diodorus ordained that the Psalms of David should be sung by the choir, in the manner of the antiphons. [ANTIPHONY.] Among the inferior orders of clergy in the church of Rome were the Psalmistæ, whose first institution appears to have been at the commencement of the fourth century. It is believed that this order was established for the purpose of encouraging and regulating the antient psalmody; for, says Bingham, 'from the first and apostolical age, singing was always a part of divine service, in which the whole body of the church joined.' (i. 295 *et seq.*) The service of the antient church usually began with psalmody, according to St. Jerome. (Hieron., *Ep.* 22, 'Ad Eustach.') It was also the exercise and recreation of the Eastern churches in their nocturnal vigils; and, indeed, at all times in the church, St. Austin remarks, was psalmody used to fill up vacant intervals. (Aug., *Ep.* 119, 'Ad Januar.')

By degrees the greater part of the psalm-tune was surrendered to a single voice, the congregation joining only at the close. This led to a more scientific and perhaps a more refined mode of singing, requiring superior knowledge: and thus, the body of the people becoming incapable of taking a share of the performance, the service was left in the hands of professed musicians. This was encouraged by the church of Rome, during her long dominion, because it still farther divided the clergy and laity: but Huss, and afterwards Luther and Calvin, restored to the people their share in the divine service, furnishing them at the same time with the means of performing it in a manner agreeable to themselves, and conformably to what they conceived to be the true principles of public worship. With this view the Psalms were turned into metre, tunes were composed or adapted, and the practice of psalmody soon became a marked distinction of those who departed from the church of Rome. Luther however was friendly to harmony, or music in parts; the severe Calvin, on the contrary, sternly refused to admit anything but simple unaccompanied melody. The design of the reformers was seconded by Clement Marot, who translated the first fifty Psalms into French verse. [MAROT.] These, adapted to popular airs, became exceedingly fashionable, and the length to which the new amusement of singing sacred songs was carried by the monarch of France and his courtiers, is fully described by Bayle (in a note on MAROT), and after him by Warton (*Hist. of Poet.*, sect. xlv.), as well as others. Theodore Beza, by his version of those Psalms which Marot left untouched, completed the hundred and fifty. [BEZA.] Most of the melodies to these, as used by the first Calvinists, are commonly attributed to Claude Goudimel and Claude Le Jeune, distinguished French composers; but Bayle, on apparently good authority, ascribes them to one Guillaume Franc; while some think that they were chiefly German. It seems almost certain that a few owe their birth to the great reformer himself, of whose musical knowledge undoubted proofs remain; and it is equally clear, for the reason before mentioned, that the *harmonized* tunes of Goudimel and Le Jeune were not admitted into Calvin's places of worship, though probably their melodies were.

At nearly the time that Marot's translation of the Psalms appeared, Sternhold and Hopkins, with several coadjutors, produced an English version, to which were adapted many of the best German and French tunes; and Strype says, 'it is certain that Sternhold composed several at first for his own solace. For he set and sung them to his organ, which music King Edward VI. sometime hearing (for he was a gentleman of the Privy Chamber), was much delighted with them.' (*Historical Memorials*, bk. i., chap. 11.) But if this versifier possessed as little musical as poetical taste, it is fortunate for him that his compositions do not remain to demonstrate that he was no less unskilful in one art than in the other. It is however to be presumed that there having been many very able musicians in the service of the youthful Edward, they contributed something in aid of Sternhold's design. But it is now generally supposed that for the majestic melody to which our 100th Psalm is adapted, we are indebted to the genius of Claude Le Jeune. This forms the *taille*, or tenor part, of his 134th Psalm, as printed in the Leyden edition of 1635; and it is necessary to remark that he, as well as others in his time, made a practice of giving the subject, or air, as a kind of *cantus firmus*, to the tenor voice. As an interesting and not commonly known relic, we insert this, substituting the treble for the cleft. The musical critic will not fail to observe that the rhythm of Le Jeune's melody does not exactly correspond to that adopted in England: and he may perhaps concur in our opinion, that the subject has been better treated by the unknown harmonist in this country than by the French composer.

The first complete collection of psalm tunes for four voices deserving notice was published in 1621, by Thomas Ravenscroft, Mus. Bac., to which Tallis, Morley, Dowland, and all the great masters of the day contributed; the name of John Milton, the father of the poet, also appears there, as the composer of *York* and *Norwich* tunes. The editor supplied many, some of which are still in use; and to his collection all the numerous works of the kind since printed have been much indebted. About the year 1671, John Playford, a good musician and a most useful industrious editor, printed, in 8vo., 'The Whole Book of Psalms in three parts,' in which he has judiciously given the melody to the soprano voice, to which it naturally belongs, and it ever since has retained its place. A few of the tunes in that collection are supposed to have been composed by Playford himself, whom Sir John Hawkins considers as 'the father of modern psalmody.' Subsequently to the last edition of his work, valuable additions were made to the stock of genuine English psalmody, by Dr. Croft, Courteville, Carey, &c., and Handel is the reputed composer of the sweet music to the 104th Psalm, which still continues in our chimes, and as the dirge at the soldier's funeral. Dr. Miller, of Doncaster, about fifty years ago, effected a considerable improvement in psalmody by his 'Psalms of David for the use of Parish Churches,' in which the version of Tate and Brady was employed, and drove Sternhold and Hopkins from many of their strongest positions. The extraordinary success of that work, which made its way into the remotest parts of Great Britain, raised up a host of rivals, and the number of publications and of new tunes has since increased beyond calculation. The popular works of all foreign composers have been made contributory to that love of novelty which carries its influence even into the temples of religion, and every tenth organist has fancied himself qualified and privileged to print a collection for the use of the church or chapel in which he officiated. Hence the music which had become almost a part of our Liturgy is falling into desuetude, and modern hymns—not always the most appropriate or the best in point of composition—threaten finally to banish the fine characteristic harmony of our antient psalmody. (Bingham's *Antiq.*; Bayle; Strype; Warton's *Hist. of Poet.*; Mason's *Essay*; Hawkins; Burney; Dr. Vincent *On Psalmody*.)

PSALMS (*ψαλμοί, from ψάλλω, to strike gently*, and so, to play on a stringed instrument) denote generally the poems which form one of the canonical books of the Old Testament. This book is called in Hebrew סֵפֶר תְּהִלִּים (*sepher tehillim*), 'the book of praises.' Many of the Psalms have titles, which, though they are no part of the original, are of great antiquity, and in these titles a Psalm is called מִזְמוֹר (*mizmor*), something pruned, trimmed, or finished off, from זָמַר, *to prune*.

The book of Psalms is often called the 'Psalms of David,' though many of them were not written by him. Ps. xc., for example was written by Moses, and Ps. lxxxv. and cxxxvii. were composed long after the time of David by persons unknown. The authors of the Psalms named in the titles are Moses, David, Solomon, Asaph, Heman, Ethan, Jeduthun, and the sons of Korah. Between the earliest and latest of the Psalms, a period of about one thousand years seems to have intervened.

According to the Masorites, the Psalms are divided into five books, of which the first ends with Ps. xli., the second with Ps. lxxii., the third with Ps. lxxix., the fourth with Ps. cvi., and the fifth with Ps. cl. The first three books end with 'Amen and Amen;' the last two with 'Hallelujah.' This division existed in the time of Jerome, but how long before is uncertain. It is thought to have been made for the purpose of rendering the Psalms in this respect like the Pentateuch. The collecting of the Psalms into one book is generally attributed to Ezra.

The Psalms afford an exemplification of every variety of Hebrew metre, and they are pervaded by the highest poetic feeling. They were designed to be rehearsed in the worship of God with the aid of instrumental music. David appointed the singing of the Psalms by a company of persons, trained for this purpose, in the worship of the tabernacle. (1 *Chron.*, vi. 31; xvi. 4-8.) This practice was continued by Solomon in his Temple (2 *Chron.*, v. 11-13), and, after the interruption occasioned by the Captivity, it was renewed by Ezra. (*Ezra*, iii. 10, 11.) The New Testament furnishes evidence that Psalmody formed, in the time of Christ and his Apostles, a part of the worship of God, and the Christian church has in all ages followed this example. The book of Psalms obtained extraordinary attention among the early Christians. Theodoret, who wrote in the first half of the fifth century, says (*Preface to the Psalms*), that while most men paid little or no attention to the rest of the Scriptures, they were so familiar with the Psalms, that in their houses, in the streets, and in the high ways, they enjoyed profit and delight by the singing of these divine odes. The following passage is part of a beautiful eulogy pronounced upon the Psalms by Hooker; 'What is there necessary for man to know which the Psalms are not able to teach? They are to beginners an easy and familiar introduction, a mighty augmentation of all virtue and knowledge in such as are entered before, a strong confirmation to the most perfect amongst others. Heroical magnanimity, exquisite justice, grave moderation, exact wisdom, repentance unfeigned, unwearied patience, the mysteries of God, the sufferings of Christ, the terrors of wrath, the comforts of grace, the works of Providence over this world, and the promised joys of that world which is to come, all good necessarily to be either known or done or had, this one celestial fountain yieldeth.' (*Ecclesiastical Polity*, v. 37.)

The canonical authority of the book of Psalms has never been disputed.

(Patrick's *Paraphrase*; Rosenmüller's *Prolegomena* and *Scholia to the Psalms*; Horne's *Introduction*.)

PSALTERY, an antient musical instrument of the harp kind, in use among the Jews, and supposed by Blanchinus to have been the נבל, *nebel* (whence ναβλα and *nablum*), mentioned in several of the Psalms. Whether this instrument was square or triangular, and played on by the finger, or struck by a plectrum, seems doubtful; the probability is that it took many forms, and was acted on both ways. Blanchinus makes it square, Luscinius triangular. According to Mersenne, and after him Kircher, the Psalterion, as they denominate this instrument, adopting the Greek term, was in shape a trapezium, and similar to that which is still in use under the name of dulcimer. [DULCIMER.]

PSAMMO'BIA. [PSAMMOCOLA.]

PSAMMO'COLA, M. de Blainville's name for a genus of conchifers (*Psammobia* and *Psammotæa*, Lam.) belonging to Lamarck's family *Nymphacea*. *Animal?*

Shell oval, elongated, regular, gaping but little, equivalve, subinequilateral; umbones well indicated and a little inclined forwards; often a well marked angle on the posterior or longest side; hinge somewhat incomplete; one or two small cardinal teeth in each valve; ligament external, very convex; two very distinct muscular impressions, united by a narrow pallial impression deeply excavated backwards and prolonged rather strongly beyond.

M. de Blainville proposes the following divisions of this group:—

1. Capsoïds.

Shell hardly gaping, striated from the summit to the base, with two intrant, oblique, divergent teeth in each valve, but largest on the left valve.

Example, *Psammocola rugosa.*

2. Psammobiæ.

Shell more gaping, striated longitudinally; teeth of the hinge much more effaced.

Example, *Psammobia virgata.*

3. Psammotææ.

Shell of the same form; a single cardinal tooth in each valve or in one only.

Example, *Psammotæa violacea.*

Psammobiæ have been found in most seas and on sandy bottoms at depths varying from 0 to 13 fathoms. [PYLORIDEA.]

PSAMMO'DROMUS, a genus of Saurians belonging to the *Pristidactyl Cœlodonts* of MM. Duméril and Bibron. [PRISTIDACTYLS.] Type, *Psammodromus Hispanicus*, Fitzing.

PSAMMOSAURUS. [SCINK.]

PSARIS. [MUSCICAPIDÆ, vol. xvi., p. 12.]

PSARISO'MUS. [MUSCICAPIDÆ, vol. xvi., p. 12.]

PSE'LAPHUS, according to Herbst, a genus of Coleopterous insects, but now regarded as a family, to which the name *Pselaphidæ* is applied. The *Pselaphi* are very minute insects and most remarkable in their structure. By some entomologists they are arranged with the *Brachelytra*, owing to their having the wing-cases short and truncated; and by others they are placed in the section *Trimera*, their tarsi having but three joints: in the classification of Latreille they constitute the last family of Coleopterous insects, being placed at the end of the Trimera.

Scarcely any of the known *Pselaphi* exceed one-twelfth of an inch in length, and the greater portion of them are under that size: they prey upon other insects still smaller than themselves, and are found under stones, and amongst herbage, especially in damp situations: some species are found under the bark of trees, and in putrid wood, and the species of one of the genera are found in ants' nests (the genus *Claviger*). They are often collected during the winter months by shaking the moss from the roots of trees, or from old walls, over a piece of white paper or cloth. They are probably found in all parts of the world. The principal characters of the group are as follows:—

Head moderately large, exserted, and most commonly of a triangular form, being broad at the base and attenuated in front: the eyes moderately prominent, sometimes wanting; palpi usually large and generally four-jointed: antennæ usually eleven-jointed, sometimes with six joints, and in one genus apparently having but one large joint, generally equal to about half the length of the insect, and increasing in thickness from the base to the apex. Thorax usually not much broader than the head, sometimes nearly cylindrical, but most commonly dilated in the middle: elytra broad, much shorter than the abdomen, and truncated behind, destitute of striæ, if we except one on each elytron near the suture, and an abbreviated stria at the base about midway between the suture and the outer margin—these are almost constant. Abdomen broad, obtusely terminated, and without appendages as observed in the Brachelytra; usually four or five joints are visible beyond the elytra: legs rather long; tibiæ curved; tarsi three-jointed, the basal joint small, and the terminal joint furnished either with one or two simple claws.

The *Pselaphidæ* are composed of the following thirteen genera, which may be most briefly characterised by throwing them into a tabular form, as in M. Aubé's Monograph, published in Guerin's 'Magasin de Zoologie' for the year 1834.

Section 1. Antennæ two-jointed.

Division 1. Tarsi with two claws.

1. A. with the claws unequal.

1. *Metopias.*—Thorax cordiform; antennæ with the basal joint almost as long as the others taken together.

1. B. with the claws equal.

2. *Tyrus.*—Palpi with the three basal joints obconical: thorax nearly spherical; antennæ with the three terminal joints very slightly incrassated.

3. *Chennium.*—Palpi with the second joint broader than the others, and of a spherical form; antennæ moniliform; thorax broad behind.

4. *Ctenistes.*—Palpi with the joints large and produced posteriorly into a spinous process.

Division 2. Tarsi with a single claw.

5. *Pselaphus.*—Body slightly elongated, elytra and abdomen somewhat depressed; the terminal joint of the palpi much elongated and clavate.

6. *Bryaxis.*—Body short, slightly convex; terminal joint of the palpi conical and somewhat dilated externally; thorax dilated in the middle and having three foveæ.

7. *Tychus.*—Body short and convex; the terminal joint of the palpi hatchet-shaped; basal joint of the antennæ large, the fifth joint dilated in the male; thorax without foveæ.

8. *Bythinus.*—Body very convex; the terminal joint of the palpi securiform; two basal joints of the antennæ large, the second often dilated in the males.

Those species in which the second joint of the antennæ is not dilated in the male sex, and does not exceed the basal joint in size, form the genus *Arcopagus* of Leach.

9. *Trimium.*—Body comparatively narrow and elongated; terminal joint of the palpi conical (or nearly so) and dilated on the inner side at the base; and terminated with one very large joint.

10. *Batrisus.*—Body elongated; antennæ inserted in a lateral groove; palpi with the terminal joint acute; thorax with three longitudinal furrows; antennæ rather long and gradually thickened from the base to the apex.

11. *Euplectus.*—Body elongated and subdepressed; terminal joint of the palpi ovate; antennæ short, inserted be-

neath the edge of the forehead and terminating in a large knob.

Section 2. Antennæ six-jointed.

12. *Claviger.*—Head elongated, obtuse in front, and not distinctly separated from the thorax; eyes none; thorax with the sides slightly rounded; body ovate; no furrows or foveæ on either the thorax or the elytra.

Section 3. Antennæ with but one large and elongated joint.

13. *Articerus.*—Head broad and notched in front, attenuated behind; eyes prominent; thorax broadest behind; body ovate.

Examples of most of these genera are found in this country. Of the genus *Metopias* only one species is known; it inhabits Cayenne. The genus *Tyrus* is found in Sweden and Germany, and perhaps in England. Of the genus *Chennium* but one species is known: it is found in the South of France. The curious genus *Claviger* has but recently been discovered in England by Mr. Westwood: it is found in the nest of a species of ant (*Formica flava*). On the Continent it has been long known.

Owing to their remarkable appearance, and the curious forms displayed by the various species, the *Pselaphidæ* have been more carefully studied perhaps than any other group of minute insects, and have given rise to several monographs—see the 'Monographia Pselaphidarum et Scydmænidarum Britanniæ,' by H. Denny, Norwich, 1825, 1 vol. 8vo.; 'Monographia Pselaphorum,' H. F. L. Reichenbach, Lipsiæ, 1816, 1 vol. 8vo. P. W. J. Müller has published a monograph on the Pselaphi in the third volume of the 'Magazin der Entomologie, von E. F. Germar.' M. C. Aubé has likewise published an excellent monograph on the same group, which has been quoted in the former part of this article.

PSEUDO-AMEIVA, Fitzinger's name for a genus of the *Pleodontes Strongylures* of MM. Duméril and Bibron, genus *Trachygaster*, Wagl., *Centropyx*, Spix. [Pleodonts.]

PSEUDO-BOA, Schneider's name for a genus of serpents (*Scytale*, Merr.) arranged by Cuvier as a subgenus of *Boa*, and described as having plates not only on the muzzle, but on the cranium, like the *Colubri*; no fossets, a round body, and the head 'd'une venue avec le tronc,' as in *Tortrix*.

Mr. Swainson makes *Pseudo-boa*, Oppel., the last genus of the family *Hydrophidæ*, or *Water Snakes*, with the following description:—

Head short, enlarged behind, and covered with large plates; back furnished with a longitudinal range of scales, wider than those of the sides.

PSEUDOBDELLA, M. de Blainville's name for a genus of *Hirudinidæ*, or *Leeches*. [Leeches, vol. xiii., p. 283.]

PSEUDOCARCINUS, M. Milne Edwards's name for a genus of *Cancerians*.

General form that of many Xanthi [Xanthus]; *carapace* slightly convex, and a little embossed near the front, which is nearly horizontal; latero-anterior borders moderately curved, and armed with more or less projecting teeth; posterior portion of the carapace nearly of the same extent as the anterior, with its lateral borders straight, and directed very obliquely backwards. The basilary joint of the *external antennæ* is very small, the second hardly reaches the front, and the third, which is lodged in the orbital gap, does not fill it, so that the antennary fosset is not completely separated from the orbit; the terminal stem of these appendages, instead of being very short, is more than twice as long as its peduncle. The prelabial space is not canaliculated, as in *Ozius*, the genus which immediately precedes it in the arrangement of M. Milne Edwards, and the external jaw-feet present nothing particular. The first pair of *feet* are remarkable for their size, especially in the male, and have nearly the same form as in *Carpilius*, but are still stronger; the pincers are equally rounded and obtuse at the end; they are unequal and armed with large rounded tubercles, which, on one side (the right generally), are few in number, but of remarkable volume. The succeeding feet are of a fair length, and much resemble those of the first division of *Xanthus*, except that they are narrower, and that their last joint is longer. The abdomen of the male is divided into seven very distinct articulations. (M. E.)

Geographical Distribution of the Genus.—The Indian and Southern Oceans.

M. Milne Edwards divides the genus thus:—

A. Species having the lateral borders of the carapace armed with four or five teeth.

a. Upper surface of the carapace embossed anteriorly.

Example, *Pseudocarcinus Rumphii*, *Cancer Rumphii*, Fabr. (Herbst, t. iii., pl. 49, f. 2.) Length from two to three inches.

Locality.—The Indian Sea.

aa. Carapace smooth, without remarkable embossments on its anterior part.

Example, *Pseudocarcinus ocellatus*. Length about three inches. Colour of the carapace yellowish, with a multitude of circular red spots; pincers black; four last pair of feet banded with red and yellow.

Locality.—Unknown.

B. Species having the latero-anterior borders of the carapace armed with nine or ten spiniform teeth.

Example, *Pseudocarcinus Gigas*, *Cancer Gigas*, Lam. Length about seven inches. Colour yellowish marbled with red; pincers black.

Locality.—The seas of New Holland.

PSEUDOCORYSTES, M. Milne Edwards's name for a genus of brachyurous crustaceans belonging to his tribe of *Corystians*, and bearing much analogy to *Corystes* [Corystes], and especially to *Nautilocorystes*.

General form approximating to *Corystes*, but the feet natatory, as in *Nautilocorystes*; *jaw-feet* differing from those of both.

Carapace nearly oval and fairly convex. *Front* narrow, advanced, and horizontal. Ocular peduncles of moderate size, and the moderate-sized orbits entirely open externally. *Internal antennæ* small, and completely covered above by the front, their stem bent back longitudinally, as in *Corystes*. Disposition of the *external antennæ* essentially the same as in those crustaceans, but the auditory frame placed at their base is very large. *Epistome* not distinguished from the prelabial space, and the *buccal frame*, which is entirely open anteriorly, prolonging itself laterally before the base of the external antennæ, where it terminates by a stout conical tooth, which with that appendage forms the lower wall of the orbit. *External jaw-feet* very wide, second joint very large, but the third small, triangular, and nearly as long as it is wide; their terminal stemlet is extremely short, and is inserted near the summit of the third joint. The *sternal plastron* is nearly of the same form as in *Corystes*. The anterior feet are stout, compressed, and of moderate length. The four succeeding feet are nearly all of the same length and very much compressed; their tarsus is lamellar, wide, and of lanceolate form, especially in the second and fifth pair. The *abdomen* is very narrow, and has only five distinct segments in the male; the third, fourth, and fifth rings are soldered together. (M. E.)

Example, *Pseudocorystes armatus*. Length two inches.

Locality.—Valparaiso.

M. Milne Edwards observes that the crustacean figured by Browne ('Jamaica,' pl. 42, f. 2) under the name of the *Grass crab* belongs to this genus, and may not differ specifically from *Ps. armatus*.

PSEUDOGRAPSUS. [Grapsus, vol. xi., p. 361.]

PSE'UDOPUS. [Scheltopusik.]

PSEUDO'STOMA. [Muridæ, vol. xv., p. 513.]

PSEUDOZOA'RIA. From the earliest times when systematic views of nature were sought, clouds have overhung the obscure confines of the animal and vegetable kingdoms. We find Aristotle perplexed regarding the animal or vegetable nature of sponge, Trembley and Ellis removing errors regarding the hydræ and celluliferous polypiaria, Lamarck classing Corallina with animals, and Blainville deciding that it is a plant. Much of the difficulty arises from the various definitions which are employed to characterise animal existence. To show irritability of parts, to have the faculty of self-movement, to exhibit sensibility—such or other characters being assumed for animals, we shall always find in some part of the vast series of life some particular beings in which these characters become unrecognisable (though they may exist), or equivocal, even if they do not conduct to erroneous results.

One of the modes by which systematists have eluded a difficulty, which nothing but strict and patient scrutiny can conquer, is by constituting an intermediate order of life, so vaguely characterised as to embrace the doubtful contermінous tribes of the animal and vegetable races. Hence the terms Phytozoa, Zoophyta, Nematozoa, and, according to the same analogy, Lithophyta, Ceratophyta, Calciphyta, to express the stony or horny nature of the animal or vegetable structures, or even to convey some hint of their analogy to mineral aggregations.

Pseudozoaria is a term of the same order proposed by Blainville to include vegetables, many of which have been ranked with the Polypiaria. It is subdivided into two classes: Calciphyta, which are principally composed of the genus Corallina, Linn.; and Nematophyta (also called Namatozoaria), which include Conferva, Oscillatoria, Byssus, &c.

Class I. Calciphyta.

Plantlike, mostly solid, attached, but not by real or penetrating roots. Composed of two substances, the interior more or less fibrous, the exterior cretaceous and porous, and generally subject to discontinuity, whence the whole appears articulated.

Lamouroux calls the group Polypiaria calcifera.

Fam. 1. Corallinæa.

Stem and branches encrusted with a thick porous calcareous substance, discontinuous at intervals, whence the whole is articulated. (This is the genus Corallina, Linn., which Lamarck and Lamouroux have greatly divided.)

Genera.

Cymopolia, Lamouroux.

Articulations moniliform, perforated by distinct circular pores.

Example, Cymopolia barbata. Ellis, 'Corallines,' pl. 25, fig. *c* C. The few species are chiefly West Indian.

Corallina.

Flabelliform, trichotomous, articulations distinct, the upper ones compressed or dilated; pores obscure.

Example, Corallina officinalis. Ellis, 'Corallines,' pl. 24, fig. *a* A. The species occur in various parts of the ocean and of the British coasts.

Jania, Lamouroux.

Divided, like moss, into slender round capillary articulated dichotomous branches.

Example, Jania corniculata. Ellis, 'Corallines,' pl. 24, fig. *d*.

European seas.

Flabellaria, Lamarck. (Halimedea, Lam.)

Flabelliform; branches trichotomous; articulations distinct, flattened

Example, Flabellaria incrassata. Ellis and Solander, pl. 20, fig. *d*. West Indies.

Amphiroa, Lamouroux.

Articulations very distinct, the intervals fibro-cartilaginous. (Some species have verticillate branches, the others are much like Corallina.)

Example, Amphiroa fragillissima. Ellis and Solander, pl 21, fig *d*.

Many of the species are Australasian.

Penicillus, Lamarck. (Nesæa, Lamouroux.)

Composed of capillary radical fibres, a simple stem, and a crown of cylindrical dichotomous articulated branches.

Example, Penicillus phœnix. Ellis and Solander, pl. 25, fig. 2.

Most of the species are Australasian.

Galaxaura, Lamouroux.

Articulations tubuliform, cylindrical, soft and cellular within, ramifying dichotomously so as to form a conical tuft, originating in a single membranoso-calcareous articulation. (Included by Lamarck in his genus Dichotomaria.)

Example, Galaxaura rugosa. Ellis and Solander, pl. 22, fig. 3.

The species are chiefly West Indian.

Acetabulum, Lamarck. (Acetabularia, Lamarck.)

Stem simple, filiform, articulated, fixed, supporting an orbicular terminal lamina, which is radiated above and below, and formed of little radiating tubes open at their ends.

Example, Acetabulum mediterraneum, Blainv.; Tubularia acetabulum, Linn. Blainville, 'Actinol.,' tab. 66, fig. 3.

Polyphysa, Lamarck.

Adherent, fixed, composed of a vertical filiform, fistulous, articulated stem, supporting a capitulum of eight or ten oval foliaceous membranous bodies arranged in a radiating manner.

Example, Polyphysa australis, Lam. 'Polyp. flex.,' pl. 8, fig. 2.

Fam. 2. Fucoidæa.

Stem and branches internally fibrous or membranous, encrusted by a thin calcareous continuous layer, *without articulations* or pores. Substance more gelatinous than in the Corallinæa.

Genera.

Udotea, Lamouroux.

Fibro-cretaceous, flabelliform; stem short, spreading rapidly into a large expansion, lobed or cut at the circumference, and marked on both faces with concentric lines. (Corallina of Linnæus.)

Example, Udotea flabelliformis, Sol. and Ellis, tab. 24. The species are American.

Dichotomaria, Lamarck.

Membrano-cretaceous, lichenoidal, originating in a short simple stem, and terminating in compressed dichotomous ramifications, rounded at the extremity.

Example, Dichotomaria fruticosa. Ellis and Solander, pl. 22, f. 5. The species are chiefly West Indian.

Liagora, Lamouroux.

Subcretaceous, branching. Ramifications ending in soft swollen parts like buds. (Analogous to Fucus, with which one species has been ranked by Gmelin.)

Example, Liagora versicolor, Lamarck. The species are chiefly from the Mediterranean.

Neomeris, Lamouroux.

Elongated, tumid in the middle, attenuated towards and enlarged at the ends, by one of which it is attached. The central axis is membranaceous and fistulous; it is surrounded by a crust composed of crowded small tubular cylinders, and in the upper part small globular tubercles. The whole is enveloped in another thin calcareous crust marked by many small pits in quincunx.

Example, Neomeris dumetosa, Lamouroux, 'Zooph.,' tab. 68, f. 10, 11. South America.

Class 2. Nematophyta, Blainville.

(Syn. Nemazoaria, Gaillon.)

Generally filamentous, gelatinous, green, unattached aquatic bodies.

Concerning these singular objects three opinions have been maintained:—

1. They have been (not all, but most of them) ranked as genuine plants by Linnæus, Lamarck, &c.

2. They have been considered as of a mixed or alternating nature, so that, growing and appearing like plants, they yield seminal parts which are endowed with locomot[illegible] (as the ova of sponges) for a short period, and thus appe[illegible] as animals. Agardh, Fries, and Bory de St. Vincent support views of this nature.

3. They have been described as plant-like agglomerat[illegible] of animals, originally free and individualised. M. Gaill[illegible] 'Annales des Sciences Naturelles,' &c., has maintain[illegible] this opinion after exact and curious researches, and ma[illegible] eminent persons have admitted this remarkable doctrine.

M. Gaillon has proposed a classification in conform[illegible] with his views, which includes two grand divisions, [illegible] Monadulées (resembling Monas or polygastric animalcu[illegible] and Naviculées (resembling Bacillaria or Navicula[illegible] the former are two families, viz. Endocystées (reproduc[illegible] globules formed internally) and Ectocystées (reproduc[illegible] globules formed externally). In the second division are [illegible] Diarthrosées (animalcula associated by junction) and E[illegible] theriées (animalcula associated without junction). T[illegible] first family includes ordinary Confervæ, &c.; the se[illegible] Mucor and Charæ, &c.; the third, Diatomæ, &c.; [illegible] fourth, Girodella. This whole subject appears still t[illegible] new researches. [ALGÆ; CHARACEÆ.]

PSI'DIUM, one of the Greek names of the pomegra[illegible] which has been applied to a South American genus of p[illegible] belonging to the natural family of Myrtaceæ. The gen[illegible] characterised by having a calyx with an obovate tube a[illegible] 5-fid limb. Petals 5. Stamens numerous. Style fil[illegible] Stigma capitate. Ovary 5-20-celled. Ovules numer[illegible] horizontal, attached to the margin of the placenta. F[illegible] baccate, covered with the tube of the calyx, and crow[illegible] by its lobes, many-seeded. Seeds in the ripe fruit nest[illegible] within a pulp. Testa bony. Embryo curved. Cotyle[illegible] leafy, very small. Radicle very large. The spec[illegible] about forty in number, either trees or shrubs. Leave[illegible] posite, quite entire, feather-nerved, not dotted. Pedun[illegible] axillary, 1-3-flowered, bibracteated. Flowers white.

Two species are alone much known. These are, P[illegible] miferum and P. pyriferum, which yield the fruits so [illegible] known under the name of Guava. These two natives of South America and of the West Indies have been transferred to the Old World, and are as extensively cultivated in the Indian Archipelago and in India as in the countries where they are indigenous. P. Cattleianum is a species remarkable for the purple colour of its fruit. The Guava, of which the name is derived from the American word Guyaba, is much esteemed in hot countries as a fruit, and comes nearest to the pear, though its odour is not thought agreeable by many. It is also preserved and made into a jelly. The roots, buds, and leaves are astringent, and used as such medicinally. Some of the species are cultivated in hot-houses, but do not ripen their fruits well.

PSILOPO'GON, Boie's name for a genus of *Picidæ* (Wood-peckers).

PSILOSO'MATA, M. de Blainville's name for his third family of his order *Aporobranchiata*, and placed by him at the end of that order and immediately before the order *Polybranchiata*, which contains the genus *Cavolina*. [POLYBRANCHIATA.]

The only genus of *Psilosomata* recorded by M. de Blainville is *Phylliröe*.

Generic Character.—Body free, naked, very much compressed, or much higher than it is thick, terminated behind by a sort of vertical fin; cephalo-thorax small, and provided with a pair of natatory appendages, which are triangular, compressed, and simulate a kind of long tentacles or branchiæ; mouth subterminal, of a horse-shoe shape, with a short retractile proboscis; anus on the right side of the body; orifice of the organs of generation unique, on the same side, and more anterior than the anus. Organs of respiration ?

Example, *Phyllirhöe Bucephalum*.

Locality.—Discovered in the Mediterranean Sea, by Péron and Lesueur.

PSI'THYRUS (Saint-Fargeau), a genus of Hymenopterous insects belonging to the section *Anthophila* (Latreille) and family *Apidæ*. The insects of this genus so closely resemble the Humble-bees (*Bombus*), that till recently they were by all authors confounded with them. The Psithyri however differ widely from the Humble-bees, inasmuch as they make no nests of their own, neither do they collect food for their young, but, like the cuckoo among birds, they deposit their eggs in the nests of others, and leave their young to be hatched and reared by them. It is the nests of the Humble-bees that they select for this purpose. Mr. Newman considered these facts relating to their economy so important, that he established an order among Hymenopterous insects, to which he gave the name *Apathites* (from *a*, without, and πάθος, affection), for the reception of the present insects, which, according to him, constitute the genus *Apathus*, and some other genera of bees. The characters of the order *Apathites*, given by the author, are as follows:—larva hatched from an egg, deposited by its parent in the nest of other *Apidæ* at the time when their own eggs are laid; when it hatches, being stronger and larger than the rightful possessor of the cell, it consumes the food provided for its companion, and starves it to death; and in those instances in which fresh supplies of food are daily provided, it continues to receive and appropriate them as its own. Pupa changes in the same situation, in a silken cocoon, spun by the larva. Imago has no apparatus either on the body or legs for collecting honey; in other respects it resembles in structure each of the other orders of *Apidæ*; it enters their nest with perfect familiarity, and seems to be quite unsuspected of intrusion; it collects no pollen or honey, never builds a nest of any kind, nor takes any care of its young, but spends its time among flowers, or hovering about sand-banks in which other bees have fixed their habitations. The genera included in this order are:—Apathus (or *Psithyrus**), *Cœlioxys, Melecta, Stelis ?, Epeolus, Nomada, Hylæus ?* (*Entomological Magazine*, vol. ii., p. 404.) The order *Apathites* however is very objectionable in many points of view; it is founded upon the habits of the species; whilst in fact the habits of the individuals composing the very genera placed by the author in his order are in many cases but partially known; the order moreover comprises genera agreeing in no positive points of structure.

The species of the genus *Psithyrus* may be distinguished from those of *Bombus* by the structure of their hinder legs. In *Bombus* the hinder tibia is compressed, smooth, and somewhat concave on the outer side, and is furnished on its edges with a fringe of stiff curved hairs, which serve to retain on the outer side of the shank the pollen collected by the insect to feed its young. The *Psithyri* have the tibia narrower and covered throughout with hair; they have no basket for the purpose of carrying pollen.

Four or five species of *Psithyrus* are found in England, and these are well described by Kirby in his 'Monographia Apum Angliæ.' They are arranged by that author in his genus Apis, section * *, c. 2, which section also includes the true *Bombi*.

Psithyrus rupestris very closely resembles the Red-tailed Humble-bee (*Bombus lapidarius*), but may be distinguished by the dark (almost black) colour of its wings. The *Apis Albinella* of Kirby is no doubt the male of this species.

Ps. campestris is black, has a yellow band on the fore part of the thorax, yellow hair on the scutellum, and a patch of yellow on either side of the abdomen at the apex. *A. Rossiellus* of Kirby is no doubt the male of this species.

P. Barbastellus is black, has the fore and hinder portion, the thorax, and the base of the abdomen yellow; the apex of the abdomen is white.

A. subterraneus and *A. vestalis* of Kirby's monograph also belong to this group.

PSITTA'CIDÆ, PARROTS, an extensive and highly interesting family of birds, remarkable for their beautiful colours, their powerful bill, their fleshy tongue, and their power of imitating the human voice. The articulation of some of the species is so perfect, that when the bird is unseen it is difficult to suppose that the words pronounced do not proceed from the mouth of man.

That several of these birds were known to the antients, both Greek and Roman, we have abundant evidence. Not to weary the reader with quotations, we shall here only refer to Ctesias (*Indic.*, 3; *Phot. Bibl.*, lxxii.); to Aristotle (*Hist. Anim.*, viii., xii.), where he notices the anthropoglott, ψίττακη, as the Indian bird, and refers to its powers of mimicry; to Arrian, who speaks of the σίτταкος, and its imitation of the human voice (*Hist. Ind.*, c. xv.); to Plutarch, who alludes to the same quality in his treatise, *De Solertia Animalium* (vol. x., p. 51, ed. Reiske; vol. iv., p. 972, Lut. Paris, 1724); to Ovid (*Amor.* ii. 6); Persius in the Prologue to his *Satires* (line 8); and Martial's delicate flattery (xiv. ep. 73),

> 'Psittacus à vobis aliorum nomina discam:
> Hoc didici per me dicere; Cæsar ave.'

These, with the exception of the passage in Ctesias, and many more examples, will be found in the learned treatise by Mr. Vigors, 'On a Group of Psittacidæ known to the Antients' (*Zool. Journ.*, vol. ii.), where he reminds us that the antient writers are unanimous in informing us that the parrots known to their times came exclusively from India. 'We are informed by Ælian,'* continues Mr. Vigors, 'that they were the favourite inmates of the palaces of the princes; and were looked up to as objects of sacred reverence by the religious feelings of the people. From thence they were introduced into Europe at the time of the Macedonian conquest; and the specific name of *Alexandri*, applied by modern science to the type of the group, in honour of the first European discoverer of it,† serves to perpetuate the name of a warrior who is said to have valued the conquests that extended the boundaries of his empire chiefly as they served to extend the boundaries of science. It was not until the times of Nero that the *parrots* of Africa became known to the Romans. (Pliny, *Hist. Nat.*, vi. 29.) Some of these birds were among the discoveries made in the course of an expedition sent out by that prince. They came apparently from the neighbourhood of the Red Sea; and it is probable that as that country became more known, numbers of the same race were imported from it into Rome, and formed the chief part of those victims of the parrot tribes, which in after-times are said to have supplied the inordinate luxury and wantonness of Heliogabalus. The Indian group thus familiar to the antients may be identified with those

* The name *Psithyrus* has been used for another group of insects; the term *Apathus* therefore should be adopted to prevent confusion.

* *De Nat. Anim.*, xiii. 18. See also Strabo (*Geog.*, xv., p. 718, ed. Casaubon).

† But see Ctesias, who, in the place above quoted, notices the bird called *bittacus* as having the voice and the tongue of a man, alluding to its size as being about that of a hawk (ἱέραξ), and to its red bill (πορφύρεον πρόσωπον) &c. We are further told (loc. cit.) that the bird speaks like a man in the Indian language, but that it speaks Greek also, if it is taught.

beautiful birds, equally the favourites of our modern times, which are brought to us from the same country, and which are distinguished by the rose-coloured collar round their neck, the brilliant emerald of their body, and the deep ruby of their bill. Pliny (*Hist. Nat.*, x. 42) points out distinctly the former character. Solinus, in general the servile copier of Pliny, confirms this description, though with a slight variation as to colour (*Polyhist.*, c. 23). Apuleius again alludes to the same characters, but more immediately and forcibly distinguishes the varying tints of the collar round the neck (*Florid.*, lib. ii.). Oppian gives the bird an epithet (ποιοίχροον ὄρνιν* *De Venat.*, vii. 488); while Ovid, in like manner, particularises both the emerald plumage and the deep-red bill' (*Amor.*, ii., vi.). To this group Mr. Vigors has assigned the name of *Palæornis*.

Organization.

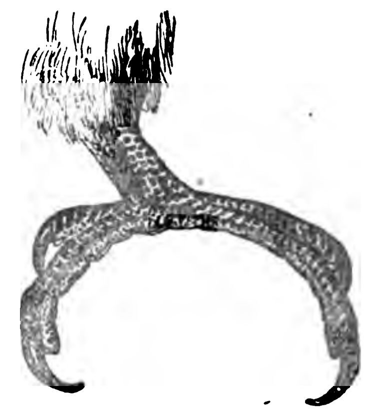
The upper mandible, which is immoveable in mammals, has more or less motion in birds, as we have seen. [Birds, vol. iv. p. 423.] Some birds indeed, for instance the capercailzie and rhinoceros birds, are not gifted with this motion; but mobility of the upper mandible is the rule in this class, and the want of it the exception. In the *Psittacidæ* this power is highly developed; for the upper mandible is not connected into one piece with the skull, by yielding and elastic bony plates, as is the case with birds in general, but constitutes a particular bone, distinct from the rest of the cranium, and articulated to it.

Skull of Maccaw.

The advantages derived to the animal from this conformation are obvious to any one who watches a parrot taking its food or using the bill as a third extremity to assist it in climbing about its cage. In most birds there is a progressive increase in the number of the phalanges of the toes: thus the great toe has two, the next three, the middle toe four, and the outer toe five. The parrots possess a peculiar cross-bone belonging to the great toe. In common with the pigeon and some other birds, they are destitute of a gall-bladder. Their intestines are very long, and are without cæca. The soft thick tongue so characteristic of this tribe must be a highly sensitive organ of taste. It is covered with papillæ, and moistened with a salivary secretion, so that they are able to taste and select different articles of food. In some of the forms, the *Trichoglossi* for instance, which feed on the nectar of flowers, the brush-like tongue is fringed with tubular processes, in conformity with the suctorial mode of feeding adopted by these birds. One of them kept by Mr. Caley, on seeing the coloured drawing of a plant, made an attempt to suck the flowers, and evinced the same disposition towards a piece of printed cotton furniture. (Post, p. 90.) The accurate observer last mentioned supplied the *Psittacus pusillus*, Lath., a species of the same genus, with honey and moistened sugar, which it sucked with ease and apparent pleasure by means of its brush-like tongue. In the museum of the College of Surgeons there is (No. 1479 c, *Physiological series*) one of these tubular tongues described as the tongue of a Lory (*Lorius Domicella*, Vigors). The tongue is short, thick, and fleshy, as in most of the parrot tribe; but it is further distinguished by terminating in a number of very delicate and close-set filaments, which can be protruded and expanded like a brush. (*Cat.*, vol. iii., part 1.) The plumage of this extensive family is of the most rich and varied description, embracing almost every colour and gradation of tint. The Zoological Society of London possesses one of the finest, if not the finest, living collections of these splendid birds in the world. The quantity of mealy dust discharged from the skin by the cockatoos, and other species of parrots, particularly at pairing time, is remarkable; though the separation of this peculiar matter from the skin is not confined to this family, but is effected in many birds of different orders, eagles and herons for instance. The characters of the powerful bill, and the grasping scansorial foot, which last is so constructed as also to convey the food to the mouth, will be seen below.

* Grass-coloured bird.

Head of Maccaw.



Foot of Maccaw.

This large, hard, and solid bill, rounded throughout, and surrounded at its base with a membrane wherein the nostrils are pierced, together with the thick fleshy and rounded tongue, gives the *Psittacidæ*, as Cuvier observes, the greatest facility in imitating the human voice, a facility to which their complicated lower larynx, with its three peculiar muscles on each side, contributes. Their strong mandibles, formed for shelling and cracking the hardest fruits, are worked by more numerous muscles than those of other birds.

Geographical Distribution and Habits.—The Parrot-tribe are found in great numbers in warm climates, and principally in the torrid zone. They are however abundant in the southern hemisphere, and occur even in high latitudes, whilst in the north they do not appear to be represented beyond the tropics by any species, except perhaps in India by *Palæornis*. Parrots occur in the southern extremity of America, throughout New Holland, in Van Diemen's Land, New Zealand, and even in Macquarrie Island, in the 52nd degree of south latitude. They are monogamous, and make their nests in the holes of trees, which they climb with their feet and bill. The shortness of their wings not permitting them to pass wide seas, the old and new continents, and even some of the large islands, have their particular species. Their food consists of fruits of almost every kind, and their natural voice is loud, harsh, and grating almost beyond endurance.

Arrangement and Natural History.

Brisson places the Parrots in his thirteenth order of birds, consisting of those with two anterior and two posterior toes. This order he divides into four sections: the first, *with a straight bill*, includes the Wryneck, Woodpecker, and Jacamar as generic forms; the second, *with the bill rather* *curved*, the Barbets and Cuckoos; the third, *with the bill short and hooked*, the Trogons, Crotophaga, and the *Parrots*; and the fourth, with the bill long, and of the size of the head, the Toucans.

Linnæus placed the genus *Psittacus* at the head of his order *Picæ*, with the following definition:—

Bill hooked; upper mandible moveable, furnished with a cere. *Nostrils* situated in the base of the bill. *Tongue* fleshy, obtuse, entire. *Feet* scansorial.

He divided the genus, which is preceded by *Lanius* (the Shrikes), and immediately followed by *Ramphastos* (the Toucans), into the following sections:

*

Macrouri cauda cuneiformi.

This division contained the Maccaws.

* *

Macrouri minores.

This division contained *Psittacus Alexandri* and the Parrakeets generally; but both in this and the former division we find Parrots that can hardly be called 'long-tailed.' Thus in the first division we have *Psittacus nobilis* with the synonyms of 'Psittacus viridis alarum costa superne rubente' of Aldrovandi (vol. i., t. 669), Sloane, *Jam.*, 2, p. 297,' '*Psittacus Amazonicus*, Briss., and *Psittacus mediæ magnitudinis Will.*, t. 16:' whilst in the second we find the *Psittacus agilis*, *Psittacus minor viridis* of Edwards.

* * *

Brachyuri cauda æquali.

This contained the Cockatoos, Lories, and True Parrots.

Latham's second order, *Picæ*, consisted of three sections, the second of which, *with scansorial feet*, included the *Parrots*, Toucans, Hornbills, Crotophaga, Trogon, Barbets, Cuckoos, Wryneck, Woodpeckers, and Jacamars.

M. de Lacépède makes the *Grimpeurs* the first subdivision of the first division (two anterior and two posterior toes) of the first subclass of birds. The first order of this subdivision (toes large and strong) is distinguished by a *hooked bill*, and the genera comprehended under it are *Ara* (Maccaws) and *Psittacus*, the latter consisting of all the Parrots and Parrakeets without denuded cheeks. The second order consists of the Toucans, the Trogons, the Touracos, and the *Musophagæ* or Plantain-eaters.

M. Duméril's *Grimpeurs* form his third order, the second family of which (*Levirostres* or *Cénoramphes*) consists of the Toucans, Plantain-eaters, Trogons, Touracos, Barbets *Maccaws*, *Cockatoos*, and *Parrots*.

The *Psittacini* form the first family of Illiger's *Scansores*, and include the genera *Psittacus* and *Pezoporus*. His second family, *Serrati*, consists of the Toucans (*Ramphastos* and *Pteroglossus*), *Pogonias*, the Touracos, the Trogons, and the Plantain-eaters.

Cuvier places the *Psittacidæ* between the Toucans and the Touracos: they consist of the *Aras* (*Ara*, Kuhl): *Perruches* (*Conurus*, Kuhl, divided by Le Vaillant into Perruches-Aras, which have naked cheeks (*Psittacus Guyanensis*, &c.); Perruches à queue en flèche (*Palæornis*); and Perruches à queue élargie vers le bout (*Platycercus*): *Cockatoos* (*Plyctolophus*): *True Parrots*: *Lories*: *Short-tailed Parrots* (*Psittacula*, Kuhl): and *Parroquets à Trompe*, Le Vaill. (*Microglossus*, Vieill.), of which last Cuvier thinks that the *Perruches Ingambes* (*Pezoporus*, Ill.) may be made a subgenus.

M. Vieillot's first tribe of his second order, *Sylvicolæ*, consists of the *Zygodactyli*; and the *Psittacins*, or *Psittacidæ*, form the first family of that tribe. The second family comprehends the *Macroglosses*, including the Woodpeckers and the Wryneck.

M. Temminck arranges all the Parrots at the end of his first family of *Zygodactyles*; the second family consists of the Woodpeckers, the Jacamars, and the Wryneck.

M. de Blainville (1815-1822) makes the Parrots his first order of birds (*Prehensores*), belonging to the anomalous subclass.

Mr. Vigors arranges the *Psittacidæ* in the normal group of the Scansores, or climbing-birds, and he observes that the immediate connection of the *Ramphastidæ* (Toucans) with *Psittacidæ*, which immediately follow them in his method, is not very evident. These families, he remarks, are placed next to each other by all systematic writers; and he decidedly concurs in the general views which bring them into neighbouring groups. But he states that he is unacquainted with any forms which intimately connect the *Ramphastidæ* and *Psittacidæ*, and soften down the important difference observable in the bills and tongues of those birds. Mr. Vigors indeed, though he hazards a suggestion as to *Trogon*, declares his opinion to be that the *Psittacidæ* afford more difficulties to the inquirer into affinities than any other known group in the whole class. He remarks that in manners and general structure, as well as in the mode of using their feet and bill, the Parrots hold nearly an insulated situation among birds; and that they may perhaps be pronounced to be the only group among them which is completely *sui generis*. In the formation of his opinion that their station in nature accords with the place assigned them in his series, and that they come next to the *Picidæ* in affinity, Mr. Vigors at first felt some doubt in consequence of their bills and tongues here equally apparent, as in the case of the *Ramphastidæ*. But he was decided in his opinion by observing that while there was no other group with which they accord more closely in such characters, they possess an affinity to no birds but the *Picidæ* in the structure of the foot and the use to which they apply it. He reminds us that the leading characteristic of the *Scansores* is the faculty of climbing; and that the greater portion of the families contained in it possess what are technically called *zygodactyle* feet, or feet in which the toes are disposed in pairs, and which are generally considered as conducive to that faculty. But he remarks that the *Picidæ* and the *Psittacidæ* are the only families thus distinguished whose toes are strictly and constantly disposed in pairs; and that they are consequently the only groups which constantly benefit by that construction in climbing. The external hind toe of the other *Scansores* is, he observes, retractile: and these birds are never seen to climb, at least to that extent which is common to the two families in question. 'We may thus venture, I think,' continues Mr. Vigors, 'to separate the Parrots and Woodpeckers from the other families, and to associate them together, in consequence of the affinity in these essential characteristics of the tribe. In this point of view they will compose its normal groups as climbers *par excellence*, differing however as to the mode in which they climb; the *Parrots* using the foot chiefly in grasping the object which assists them in their ascent, and in conjunction with the bill; while the *Picidæ* rely upon the strength and straightness of the hind toes in supporting them in a perpendicular position on the sides of trees; in which posture they are also assisted by the strong shafts of the tail-feathers. While I was influenced by these general points of coincidence in placing the *Psittacidæ* and *Picidæ* together, I recognised a group which appeared to intervene between them, and to diminish the apparent distance that exists even in the form of their bill. That important group which comprises the Linnean *Barbets* evidently exhibited the expected gradation in the structure of that member; the bill of *Pogonias*, Ill., approaching most nearly that of the *Parrots* by its short strong and hooked conformation, while the straighter and more lengthened bill of the true *Bucco* united itself to that of *Picus*. Many other particulars in form, and also in extraordinary conformity in colouring, still further pointed out the affinity; and I was at length confirmed in my conjectures respecting the situation of these birds, by arriving at a knowledge of their habits being actually those of the true *Woodpeckers*, and of their chief affinity being to that group. The regular gradation by which these two families, united in their general characters, and those the characters, it must be remembered, most prominent and typical in their own tribe, are also united in their minuter points of formation, appears to me now eminently conspicuous.' With regard to these minuter points, Mr. Vigors observes that some of the *Psittacidæ*, among which he particularises *Psittacus Alexandri*, Linn. (*Palæornis*), and its congeners, partially employ the tail in supporting themselves as they climb, in a corresponding manner with the Woodpeckers. The tongue, also peculiar to the *Psittacidæ*, he remarks, becomes slenderer, and, as is said, more extensible in that group of which *Ps. aterrimus*, Gmel., is the representative, thus evincing an approximation, slight indeed, but still an approximation to the bill of the *Woodpeckers*. (*Linn. Trans.*, vol. xiv.)

M. Latreille makes the *Psittacins* the first family of the order *Grimpeurs*. He divides the family into two tribes: the first consisting of the genera *Ara*, *Perruche*, *Pézopore*, and *Kakatoës*; and the second of the genus *Eurhynque*.

In the method of M. de Blainville developed by M. Lherminier in 1827, the family of Parrots appears in the Normal subclass between the Touracos and the Humming-Birds.

In M. Lesson's *Projet de Classification*, the '*Psittacées*' appear as the first tribe (*Zygodactyles*) of the '*Insessores* or *Grimpeurs* (*Hétérodactyles*):' they are immediately succeeded by the '*Pogonicés*.'

Mr. Swainson is of opinion that the Parrots constitute the subtypical division of the *Scansores*, wherein the powers of climbing are less developed. 'If,' says Mr. Swainson, any group in nature be isolated, it is this. Possessing in themselves the strongest characteristics, there is no bird yet discovered which presents any point of connection to them: approximations indeed are certainly made towards them by the tooth-billed Barbuts (Barbets, *Pogonias*); but there is still a gap, which no genus yet discovered is calculated to fill up. On considering the relative difference between the barbuts and the parrots, we should say, theoretically, that of all the five groups among the latter, one only remains to give the typical structure.' As the Parrots appear to Mr. Swainson to form a group precisely equivalent to the true Woodpeckers, he arranges them under five genera: the Maccaws, the Parrots, the Cockatoos, the Lories, and the Ground Lories (*Platycercus*, Vig.). In the synopsis at the end of the work (*Classification of Birds*) we find the following arrangement:—

Psittacidæ.

Bill very short: the upper mandible greatly curved over the lower, which is considerably shorter.

Subfamily Maccrocercinæ. *Maccaws.*

Upper mandible greatly hooked; lower mandible much higher than broad. Tail very long, cuneated.

Genera: *Macrocercus*, Vieill.; *Conurus*, Kuhl; *Leptorhynchus*, Sw.; *Palæornis*, Vig.

Subfamily Psittacinæ. *Parrots.*

Upper mandible very distinctly toothed; lower mandible longer than it is high. Tail short, even, or rounded.

Genera: *Erythrostomus*, Sw.; *Chrysotis*, Sw. (Amazonian Parrots); *Psittacus* (Parrot of the Old World—most typical of this subfamily); *Agapornis*, Selby; *Poicephalus*, Sw.

Subfamily Plyctolophinæ. *Cockatoos.*

Head large, ornamented with a folding or procumbent crest. Bill short, very broad; the culmen remarkably curved. Tail rounded, lengthened, broad; the feathers not narrowed.

Genera: *Plyctolophus*, Vieill. (subtypical); *Licmetis*, Wagl.; *Microglassus*, Geoff.; *Centrourus*, Sw.

Subfamily Lorianæ. *Lories.*

Bill but slightly curved; the margin of the upper mandible sinuated; the notch obsolete; lower mandible slender, conic, much longer than high; the gonys (typically) straight.

Genera: *Brotogeris*, Vig.; *Psittaculus*, Kuhl; *Trichoglossus*, Vig.; *Lorius*, Brisson; *Pyrrhodes*, Sw.

Subfamily Platycercinæ. *Loriets.*

Tail long, very broad, considerably cuneated. Bill strong, thick, toothed: the culmen very convex. Under mandible deep, but very short: the gonys curved. Feet and toes slender. Tarsus longer than the hallux.

Genera: *Vigorsia*, Sw.; *Platycercus*, Horsf. and Vig.; *Nanodes*, Horsf. and Vig.; *Leptolophus*, Sw.; *Pezoporus*, Ill. (Swainson).

The family is placed by Mr. Swainson between the *Ramphastidæ* and the *Picidæ*.

Mr. G. R. Gray (*List of the Genera of Birds*) also arranges the *Psittacidæ* between the *Ramphastidæ* and the *Picidæ*, in the following method:—

Subfamily I. Platycercinæ.

Genera: *Coracopsis*, Wagl. (*Psittacus*, Linn.; *Mascarinus* [illegible] *Vigorsia*, Sw.).

[illegible], Wagl. (*Psittacus*, Vieill.).

Platycercus, Vig. (*Psittacus*, Lath.).

Nymphicus, Wagl. (*Psittacus*, Lath.; *Calopsitta*, Lath.; *Leptolophus*, Sw.).

Subfamily II. Arainæ.

Genera: *Ara*, Briss. (*Psittacus*, Linn., *Macrocercus*, [illegible] *Sittace*, Wagl., *Arara*, Spix): *Anodorhynchus*, [illegible] (*Psittacus* [illegible], *Macrocercus*, Vieill.—Ex. *Hyacinthine Maccaw*). *Conurus*, Kuhl (*Psittacus*, Shaw, *Aratinga* [illegible] *Psittacara* [illegible], *Sittace*, Wagl., *Macrocercus*, [illegible]). *Tanygnathus*, G. R. Gray (*Psittacara*, [illegible] *Sittace*, Wagl., *Leptorhynchus*, Sw., *Psittacaria*, [illegible]

Subfamily III. Palæorninæ.

Genera: *Trichoglossus*, Vig. and Horsf. (*Psittacus*, Linn., *Australasia*, Less.); *Palæornis*, Vig. (*Psittacus*, Linn., *Psittaca*, Br., *Conurus*, Less.); *Pezoporus*, Ill. (*Psittacus*, Shaw); *Polytelis*, Wagl. (*Psittacus*, Sw., *Palæornis*, Vig. and Horsf.); *Centrourus*, Sw. (*Psittacus*, Lath., *Trichoglossus*, Vig. and Horsf.); *Euphema*, Wagl. (*Psittacus*, Lath., *Lathamus*, Less., *Nanodes*, Vig. and Horsf.).

Subfamily IV. Lorinæ.

Genera: *Charmosyna*, Wagl. (*Psittacus*, Gm., *Psittaopous*, Less., *Pyrrhodes*, Sw., *Palæornis*, Vig.); *Brotogeris*, Vig. (*Psittacus*, Lath., *Trichoglossus?* Steph., *Coriphilus*, Wagl., *Lorius* and *Lathamus*, Less.); *Lorius*, Briss. (*Psittacus*, Linn., *Domicella*, Wagl.); *Eos*, Wagl. (*Psittacus*, Gm.); *Electus*, Wagl. (*Psittacus*, Gm.); *Psittacodis*, Wagl. (*Psittacus*, Linn., *Muscarinus*, Wagl.).

Subfamily V. Psittacinæ.

Genera: *Tanygnathus*, Wagl. (*Psittacus*, Linn., *Muscarinus*, Less., *Erythrostomus*, Sw.); *Triclaria*, Wagl. (*Psittacus*, Spix, *Erythrostomus*, Sw., *Maximilicus*, Less.); *Psittacus*, Linn. (*Jaco*, Less.); *Chrysotis*, Sw. (*Psittacus*, Linn., *Androglossus*, Vig. ?); *Pionus*, Wagl. (*Psittacus*, Linn.); *Poicephalus*, Sw. (*Psittacus*, Linn., *Pionus* β., Wagl.); *Agapornis*, Selby (*Psittacus*, Kuhl, *Psittacula*, Wagl., *Poicephalus*, Sw.); *Psittacula*, Kuhl (*Psittacus*, Lath., *Psittaculus*, Sw.); *Nasiterna*, Wagl. (*Psittacus*, Quoy and Gaim., *Micropsitta*, Less.).

Subfamily VI. Cacatuinæ.

Genera: *Cacatua*, Briss. (*Psittacus*, Linn., *Plyctolophus*, Vieill., *Kakadoe*, Kuhl); *Calyptorhynchus*, Vig. and Horsf. (*Psittacus*, Lath., *Cacatua*, Vieill., *Banksianus*, Less., *Plyctolophus*, Sw.); *Corydon*, Wagl. (*Psittacus*, Lath., *Plyctolophus*, Sw., *Calyptorhynchus*, Vig. and Horsf.); *Licmetis*, Wagl. (*Psittacus*, Kuhl, *Cacatua*, Less.); *Microglossum*, Geoffr. (*Psittacus*, Gm., *Cacatua*, Vieill., *Probosciger*, Kuhl, *Solenoglossus*, Rantz., *Eurhynchus*, Latr.); *Nestor*, Wagl. (*Psittacus*, Forst., *Plyctolophus*, Gould); *Dasyptilus*, Wagl. (*Psittacus*, Less., *Psittrichas*, Less., *Centrourus*, Sw.).

Of the genera here stated, *Leptorhynchus* is noted as having been previously employed; and *Nanodes* and *Polytelis* as being similar to a word used in entomology. Other forms are marked in the subfamily *Psittacinæ*, viz. *P. Feildii*, Sw., *P. pileatus*, Scop., and *P. mitratus*, Pr. Max., with a query as to whether they are not entitled to rank as genera.

It is impossible to read this elaborate catalogue without being struck with the labyrinth of names in which the unfortunate student must find himself involved. In too many instances the genera thus coined bear the impress of crude theory, and those who promulgate them would find it very difficult to define the characters on which they ought to rest.

We proceed to lay before the reader some of these forms.

Macrocercus.—The *Maccaws* are all natives of America, and principally of its southern portion. The *Carolina Arara* (*Psittacus Carolinensis*, Linn.) has been recorded as occurring in the United States as high as lat. 42°, though, according to Audubon, few are now to be found higher than Cincinnati; but the true Maccaws are natives of much warmer latitudes. Though the tongue is thick, fleshy, and soft, their powers of imitation fall far short of those of the true Parrots and Parrakeets, and the harsh tones with which, after much teaching, they not very perfectly articulate a few words, contrast strongly with the assumed musical voice and ready docility of the latter. They are however capable of great attachment when domesticated. Their natural notes are screams of the most discordant and piercing kind. The hollows of trees are the places selected for their nests, and the number of eggs laid amounts to two, which are said to undergo the incubation of the male as well as the female.

The Great Green Maccaw (*Psittacus militaris*, Auct.), inhabiting the warmer districts of the chain of the Andes, where it is found as high as about 3000 feet, in Mexico and Peru; the *Hyacinthine Maccaw* (*Macrocercus Hyacinthinus*; the *Red and Blue Maccaw* (*Macrocercus Aracanga*; and the *Blue and Yellow Maccaw* (*Macrocercus Ararauna*), are known to most admirers of this gay race; though the *Hyacinthine Maccaw* is rarely seen alive in this country, and is not common even in museums.

Generic Character.—Size large. *Orbits* and sometimes the face destitute of feathers. Nostrils concealed. Notch in the upper mandible obsolete; the under remarkably short, but very deep. (Sw.)

We select as an example *Macrocercus Araraună*.

Description.—Bill black, largely and strongly developed. The upper mandible, which not unfrequently measures from the forehead to the tip 3½ inches, is much deflected: the under mandible is short, deep, and very stout. Cheeks white, naked, with three fine narrow lines of black plumelets under the eyes, the irides of which are yellowish. Beneath the under mandible a broad black band extending upwards to the ears behind a great part of the white naked patch. Plumage rich blue above, blending into green on the forehead, crown, some of the smaller wing-coverts, and rump. Greater quills and tail nearly violet. Wings and tail, beneath, yellow. The rest of the under parts rich saffron. Legs and feet blackish-grey. Total length about 39 inches, of which the tail measures some 24 inches.

Geographical Distribution.—Tropical America. The Brazils, banks of the Marañon, or Amazon river, Guiana, Surinam, &c.

Habits.—Though generally living in pairs, the Blue and Yellow Maccaws sometimes assemble in large flocks, their favourite haunts being swampy woods where a species of palm on whose fruit they principally feed is abundant. They fly well and often very high, showing a great command of wing, especially before they alight on the top of the lofty trees which they select for their resting-place. The two eggs, which are laid in the hollows of decayed trees, as well as the young, are said to receive the parental care of the male as well as of the female, which have two broods a year generally. Mr. Selby (*Naturalist's Library—Parrots*) notices a very fine individual completely domesticated at Dr. Neill's, Cannonmills (near Edinburgh), which is allowed the freedom of several apartments; and he tells us that when the bird is desirous of being noticed, it calls out 'Robert,' the name of its earliest master, very distinctly, but that it has not acquired more than one other conventional sound.

Macrocercus Araraună.

Psittacara.—Between the *Maccaws* and *Parrakeets* (*Palæornis*) comes the genus *Psittacara* (Vig.). 'These birds,' says Mr. Vigors, 'although their cheeks are covered with feathers, and they are thus brought within the circle of the *Parrakeets*, have yet the bill of the *Maccaws*; and by a greater or less nakedness of the orbits round the eyes they still further assert their affinity to them. From their osculant situation between the two groups, thus strikingly apparent, the species that exhibit these characters have received the familiar name of *Parrakeet-Maccaws* in our language, and of *Perruche-Aras* among the French ornithologists. Like the true Maccaws, they are exclusively natives of the New World.' (*Zool. Journ.*, vol. ii.) Mr. Vigors adds in a note, that a species nearly allied to both these groups had then lately been brought to this country.

Generic Character.—*Head* feathered, space round the eye naked. *Bill* thick, rather short; upper mandible compressed at the apex, the lower mandible very short inclining inwards, deeply emarginate. *Wings* moderate; first and fourth quills equal, third rather longer, second longest; internal web of the first slightly notched near the middle, external webs of the second to the fifth inclusive gradually broader in the middle. *Feet* rather strong, *tarsi* short. (Vig.)

Example, *Psittacara leptorhyncha.*

Description.—Green; space round the eye white; interocular band and frontal fillet red; tail cinnamon red.

Psittacara Leptorhyncha.

The subfamily *Palæornina*, as it appears in Mr. Vigors and Dr. Horsfield's *Description of the Australian Birds in the Collection of the Linnæan Society* (*Linn. Trans.*, vol. xv.), consists of the genera *Nanodes*, *Platycercus*, *Pezoporus*, *Palæornis*, and *Trichoglossus*.

Palæornis.—The Parrakeets forming this group belong to Continental India and some of the neighbouring islands in the Indian Ocean and Africa, with the exception of *Palæornis Barrabandi* (*Polytelis* of Wagler), which is a native of New Holland. India and its islands must however be considered as the principal locality of the species, which, according to Wagler's monograph, amounts to eleven, including *Palæornis inornatus* (*Psittacus incarnatus* of authors), which he adds to the group with doubt.

These *Ring Parrakeets*, as they are generally termed, are justly held in high estimation for the symmetry of their form, the grace and elegance of their movements, the beauty of their colours, their great docility and powers of imitation, and their fond attachment to those with whom they are domesticated and who treat them with kindness. They were not less prized, as we have seen, by the antients; and it becomes a not uninteresting inquiry to endeavour to ascertain what were the species known to them. Some suppose that *Palæornis Alexandri* was the only one: but though that species may have been and was probably the first introduced into Europe, we think that it will appear that those who confine the Parrakeets known to the antients to that bird have taken too narrow a view of the subject.

Mr. Vigors, in the paper above alluded to, says—

'It is not easy to decide, although we may form a probable conjecture on the subject, how many and which of the species of *Palæornis* were known to the antients. Ælian (*De Nat. Anim.*, xvi. 2) tells us that they were acquainted with three species. But as some of the more common species approach each other most closely in their specific characters, it is not improbable that the differences between them might have been passed over by observers who were so little accustomed and had so little occasion to pay attention to minute distinctions, and that four or five species at least were familiar to antiquity. The birds that come from the remoter Indian islands, *P. Papuensis*, *Malaccensis*, and *Xanthosomus*, in particular, are in all likelihood among the number of those which have been only known in recent times. To these may of course be added the newly-characterised species from New Holland, the *P. Barrabandi*. The beautiful blossom-headed species also, *P. erythrocephalus* and *Bengalensis*, which are even now more rarely met with than the neighbouring species, most probably did not come under the observations of the antients; for it is impossible that they should have passed over without notice the lovely and changeable roseate colour of the head, which casts into the shade even the collar round the neck so frequently alluded to by them, if either of these birds had been before them. The poets at least would have seized upon a character which involved so truly poetic an image, and Ovid or Statius would have woven it up among the most conspicuous wreaths of their beautiful elegiac garlands. *P. bitorquatus*, the locality of which is unknown, is at present of rare occurrence; but it formerly might have been more generally distributed. The species which we can imagine to have been best known to former times are the *P. Pondicerianus* and *flavitorquis*, which are diffused over the whole of the Indian continent, the former species more particularly, which is now also found dispersed over a

Palæornis Alexandri.

great extent of the Eastern Archipelago. *P. Alexandri* appears to have been the bird sent from Ceylon to the Macedonian warrior from whom it derives its specific name; Ceylon, or the antient Tabrobana, being the principal resort, even down to the present moment, of that species. And it is probable also that the Romans, particularly in later times, received a great number of the same species from that island.—If to these birds we add the *P. torquatus*, which is the species that agrees most intimately with the descriptions of Pliny, and, after him, of Apuleius, and which is generally scattered over the Indian as well as the African continent on the eastern side, we shall probably have before us all the species known to the antients of this classical group.'

Generic Character.—Bill rather thick; the upper mandible dilated, the culmen round, the lower mandible broad, short, and emarginate. *Wings* moderate; three last quills (extimis) nearly equal, longest; external webs of the second, third, and fourth gradually broader in the middle. *Tail* graduated; the two middle very slender feathers much exceeding the rest in length. *Feet* with short and weak tarsi; the claws moderate, rather slender, and falcate. *Body* slender and neat. (Vig.)

Mr. Vigors divides the genus into the following sections:—

* Lower mandible short.

P. Alexandri, *P. torquatus*, *P. flavitorquis*, *P. bitorquatus*, *P. Xanthosomus*, *P. Malaccensis*, *P. erythrocephalus*, *P. Bengalensis*, *P. Pondicerianus*, *P. Barrabandi*.

** Lower mandible elongated.

P. Papuensis.

We select as an example the generic type, *P. Alexandri*.

Description.—Green, with a vermillion collar; throat and band between the eyes black; spot on the wings purple-red. Differs from *P. torquatus* by the greater size of the bill and the dark red spot on the shoulders. (Vig.)

Locality.—Ceylon and parts of the continent of India.

Platycercus (*Loriets*).

Generic Character.—Bill rather short, the upper mandible rounded and dilated, the lower one short, deeply emarginate, with the apex squared. *Wings* rounded; the first quill shorter than the second and equal to the fifth; second and third longest; the external webs of all except the first abruptly notched towards the middle. *Tail* broad, depressed, rather rounded or sub-graduated; the tail-feathers rounded at the apex. *Feet* with elevated tarsi; the toes slender and elongated, and the claws long and but little falcated.

Example, *Platycercus scapulatus*, *Tabuan Parrot*, or *King's Parrot*.

Description.—Male.—Green; the head, neck, and body beneath scarlet; nuchal lunula and rump lazuline; longitudinal scapular line pale green-cerulean; tail-feathers black, with brilliant green reflections.

Female.—Head and neck green.

Locality.—New Holland.

Habits, &c.—Mr. Caley seldom noticed a full-coloured specimen, that is, red. He states that, when the Indian

Platycercus scapulatus.

corn is ripe, they may be seen in large flocks on the farms, clustering on the stalks and occasioning much mischief to the crops. He apprehends that the greater part of these flocks are young birds, as it is rare to see a bright red one among them. The natives told him that this species breeds chiefly in a white gumtree (a species of *Eucalyptus*), making its nest of a little grass, and lining it with feathers. It has, he adds, as many as twelve young ones and the eggs are of a dirty white with black specks; the nest is found by its enlarging the hole at which it creeps in; this process gives the surrounding part a reddish appearance, which, forming a contrast with the whiteness of the other parts, renders it conspicuous.

Mr. Swainson had one of these beautiful birds alive in his possession for many years. Its manners were gentle and bland. Like many of its congeners, it delighted to wash itself in a basin of water. In the day and during winter it was generally silent; but on a mild evening it would go on for two or three hours with a somewhat whistling note, sometimes shrill, but generally soft and pleasing. Its ordinary diet was moistened bread, with a little hemp and canary seed; but during summer and autumn the small garden fruits appeared to be highly welcome to it. (*Zool. Ill.*, 2nd series.)

Nymphicus.

Generic Character.—*Bill* distinctly toothed, culmen slightly carinated; *nostrils* thick, tumid, naked; *head* crested; wings very long, outer web of the quills not sinuated; *tail* very broad, cuneated, the two middle tail-feathers conspicuously longest and pointed. (Sw.)

(Mr. Swainson considers this to be the *rasorial* type.)

Example, *Nymphicus Novæ Hollandiæ*.

Description.—*Male.*—Forehead, crest, and cheeks lemon-yellow; ear-coverts rich reddish-orange; back of the neck, two centre tail-feathers, and the external margins of the primaries brownish grey; back, shoulders, and all the under surface and outer tail-feathers greyish chocolate-brown, the shoulders and flanks being the darkest; a white mark extends from the shoulders lengthwise down the centre of the wing; bill and bare space round the eye brownish-grey; feet blackish-brown.

Nymphicus Novæ Hollandiæ.

Female.—Differs from the male in the colour of the face and crest being of a dull olive-yellow, the latter becoming still darker at its extremity; in having the throat greyish-brown and the back lighter than in the male; the lower part of the abdomen, upper tail-coverts, and tail-feathers yellow, except the four middle ones, which are grey; the whole transversely and irregularly barred with lines of brown. Total length twelve inches.

Locality.—New Holland.

Habits, &c.—Mr. Gould, whose accurate description we have given from his grand work on the *Birds of Australia*, now in the course of publication, states that this species has many of the actions of the *Platycerci*, being extremely active and running round its cage with surprising agility, in which particular it is only equalled by the most terrestrial members of the family. To give some idea of the immense flocks of this beautiful bird which inhabit the interior of Australia, the same author informs us that his brother-in-law, Stephen Coxen, Esq., procured more than two hundred examples during a single excursion into the interior.

Euphema, Wagl. (*Nanodes*, Vig.).

Generic Character.—*Bill* short, the culmen rounded, higher than it is long, being very like that of *Melopsittacus*, the lower mandible very *short*, inclining inwards, and emarginate. *Wings* moderate, subacuminate; first and second quills, which are nearly equal, longest; the external webs of the second and third slightly emarginate towards the apex. *Feet* moderate; *tarsi* and *toes* rather slender. *Tail* graduated, cuneated; tail-feathers slender towards the apex. (Vig.)

Example, *Euphema undulata*.

Description.—*Male.*—Crown of the head and throat pale yellow, the latter ornamented on each side with several rich blue spots, a row of which, but of a darker tint, crosses the throat in the form of a crescent; sides and back of the head, back of the neck, upper part of the back, scapulars and wing-coverts olive brown, each feather having a crescent-shaped mark of black near its extremity, and margined with yellow; primaries green on their outer edges, the tip and internal web brown; secondaries crossed by a broad band of yellow, which is continued, but much narrower, across some of the primaries; breast, all the under surface, lower part of the back, and the tail-coverts fine pale green; two centre tail-feathers deep blue at the base, passing into deep green at the tip; the remainder of the tail-feathers bright yellow, tipped with dark green; bill horn-colour at the base, passing into pale yellow at the tip; feet flesh-colour.

Female.—Differs in being less brilliant in all her markings, and in having the blue spots on the throat less defined and irregular in form. Total length seven inches and a half. (Gould, *Birds of Australia*.)

Locality.—Interior of New South Wales.

Euphema undulata.

Habits, &c.—Captain Sturt discovered this species in great abundance in the interior of New South Wales. He informed Mr. Gould that on the extensive plains bordering the Morumbidgee he met with it in immense flocks, feeding upon the seeds and berries of the low stunted bushes called scrubs. Mr. Gould also received several from Mr. Coxen, which the latter had procured to the north of Hunter's River. Mr. Gould adds that they are quick and active, and run on the ground with great facility, much after the manner of the true *Platycerci*, or Ground Parrakeets, to which he is of opinion they are closely allied in affinity.

Trichoglossus (*Lorikeets*).

Generic Character.—Bill somewhat elongated, rather compressed; lower mandible nearly straight, the margin entire, longer than it is high. *Tongue* furnished below with many marginal bristles at the apex. *Wings* moderate; first *quill* longest, second and third a little shorter, webs entire. *Feet* rather short; *tarsi* somewhat covered with the femoral feathers; *acrotarsi* a little feathered below the knee: toes rather strong, depressed; *claws* strong, falcate. *Tail* graduated; the tail-feathers rather narrower at the apex. (Vig.)

Locality.—New Holland.

Mr. Vigors (*Linn. Trans.*, vol. xv.) remarks, that besides the external characters specified above, which separate this genus from the rest of the subfamily *Palæorninæ*, a decided ground of distinction is exhibited in the formation of the tongue; the under part of this member being furnished at the apex with numerous strong hairs or bristles, of a brush-like structure, and which seem to serve the bird for the purposes of suction. (Ante, p. 84.) He remarks that the tendency of a considerable portion of the birds of New Holland to feed by suction upon vegetable juices, for which a sufficient provision is made by nature in the luxuriant vegetation and the constant succession of flowers in that country, renders this singular deviation from the general form of the *Parrot's* tongue less surprising; and he further observes that it is to be remarked that although the *Parrots* are in general a long-lived race, and of all birds perhaps the most easily reared, and although the birds of the present group are most numerous in New Holland, few of them have been kept alive for any length of time in a state of confinement. He accounts for this from the probable ignorance of their natural mode of feeding.

The natural and acquired habits of the species of this genus require some notice. Mr. Caley informs us that the *Blue-mountain Parrot, War'rin* of the natives (*Trichoglossus hæmatodus*), is remarkable for its docility and attachment to some people, whilst it is a perfect scold to others who may have teazed or offended it. 'Flocks of these birds,' says this accurate observer, 'may be seen in the *Eucalypti* trees when in flower, in different parts of the country, but in the greatest number near their breeding-places. It does not eat any kind of grain, even when in a domesticated state. It is much subject to fits, which generally prove fatal; and it is rare to find an individual kept alive above a couple of years. One that I kept, on being shown a figure of a coloured plant, used to put its tongue to the flowers, as if with the intent of sucking them; and I have seen it make the same attempt with a piece of cotton furniture. The flesh of this bird is very good eating.' Again, speaking of the *Crimson-fronted Parrakeet, Coolich* of the natives (*Trichoglossus concinnus*), Mr. Caley states that it may be observed in large flocks sucking the *Eucalypti* flowers. He adds that, like the *Blue-mountain Parrot*, it is subject to fits, which generally prove fatal, that it is seldom kept alive, and that its breath or some part about its head emits a very sweet odour. The natives told him that this species breeds in the hollow boughs of trees, scraping out the decayed mould, and making its nest of it. The eggs, he informs us, are green, without spots, and the number of young two. Of the *Small Parrakeet, Jerryang* of the natives (*Trichoglossus pusillus*), he observes that this, like the *Coolich*, is seen in very large flocks in the *Eucalypti* trees when in blossom. 'The natives,' says he, 'now and then bring in the young ones, but they seldom live long. I had three young ones for some time, which used to huddle together and give out a very pleasing note. They all died, strongly convulsed, and nearly at the same time; the limbs were as stiff the moment life was extinct as if the body had become cold. The natives tell me that it builds in the hollow limbs of trees, making no other nest than of the decayed wood. It has four young ones. The eggs are white, and without spot.'

Mr. Caley also learned from the natives that the nest of this species, of the *Ground Parrot* (*N. pulchellus*), of the *Dulang* (*Pl. Pennantii*), and of the *Coolich* (*Tri. concinnus*), smell very strong and offensive of dung.

Example, *Trichoglossus hæmatodus* (Vig., *Trichoglossus Swainsonii*, Jardine and Selby).

Description.—Green; head, middle of the body, and bands on the sides azure-blue; throat, breast, and flanks orange crimson. (Sw.)

Blue-bellied Parrakeet.

Lorius.—The true Lories are remarkable for the elongated and weak form of the bill, and also for a formation of the tongue, similar to that in *Trichoglossus*. (Ante, p. 84.) They are inhabitants of the islands of the East, and are considered by Mr. Vigors to be the aberrant group of the family. Their colours are of the most rich and mellow description, and the birds are highly prized, not only for their beautiful plumage, but for their lively, active, and affectionate disposition, and their great docility in the articulation of words and even sentences.

Generic Character.—Bill elongated, weak. *Wings* pointed, two first quills longest. *Tail* moderate, rounded or graduated; the feathers broad, and hardly narrow at their tips.

Example, *Lorius Domicella.*

Lorius Domicella.

Description.—Rich scarlet; upon the upper part of the breast a yellow collar; crown of the head blackish purple in front, passing into violet-purple behind; upper surface of the wings green, violet-blue at the bend and margins, as are the under wing-coverts; thighs externally azure, greenish at the base; bill orange-yellow; length between 11 and 12 inches.

Locality.—The Moluccas and other Eastern Islands.

The *Plyctolophinæ*, or *Cockatoos*, are natives of Australia and the Indian Islands, inhabiting the woods, and feeding upon seeds and soft and stony fruits, which last their powerful bill enables them to break with ease. Like others of their congeners, they make their nests in decayed trees, and are easily tamed when taken at an early age. They become familiar and even attached, but their imitative powers seldom go beyond a very few words added to their own cry of 'Cockatoo.'

Plyctolophus (*True Cockatoos*).

Generic Character.—*Bill* strong, short, very broad, culmen much curved. *Head* with a folding crest. Base of the under *mandible* frequently concealed by feathers. *Wings* long; secondaries, tertiaries, and the tail-feathers sometimes mucronate.

Example, *Plyctolophus galeritus* (*Crested Cockatoo*, White).

Description.—White, crest, and internal webs of the lateral tail-feathers yellow; under wing-coverts sulphureous.

Locality, New Holland.

Habits, &c.—Mr. Caley's notes contain the following observations on the Crested Cockatoo:—'This bird is called by the natives *Car'away*, and also *Curriang*. I have met with it in large flocks at the conflux of the Grose and Hawkesbury rivers, below Mulgo'ey on the former river, and in the long meadow near the Nepean river. They are shy, and not easily approached. The flesh of the young ones is accounted good eating. I have heard from the natives that it makes its nest in the rotten limbs of trees, of nothing more than the vegetable mould formed by the decayed parts of the bough; that it has no more than two young ones at a time, and that the eggs are white without spots. The natives first find where the nests are by the bird making *Co'tora* in an adjoining tree, which lies in conspicuous heaps on the ground. *Co'tora* is the bark stripped off the smaller branches, and cut into small pieces. When the young ones are nearly fledged, the old birds cut a quantity of small branches from the adjoining trees, but never from that in which the nest is situated. They are sometimes found to enter the hollow limb as far as two yards. The nests are generally formed in a *Black butted* Gum-tree; and also in *Corny'bo*, *Cajim'bbora*, and *Yarrowar'ry* trees (species of *Eucalyptus*). Their breeding-places appear to be local.'

Plyctolophus galeritus.

Mr. Vigors divides the genus into the following sections:

*

Cristâ plicatili, acuminata, antrorsum tortâ.

Of this division he gives *Plyctolophus galeritus* above described as the example.

* *

Cristâ rotundatâ, retrorsum incumbente.

Of this section he gives the *Rosalbin Cockatoo*, *Plyctolophus Eos*, *Psittacus Eos* (Kuhl) as the example.

The *Tricolour-crested Cockatoo*, *Plyctolophus Leadbeateri*, Vig., *Cacatua Leadbeateri*, Wagl., also a native of New Holland, is the most splendid species yet discovered. Nothing appears to be known of its habits. In Mitchell's interesting Journal, where a coloured figure of the bird is given, it is called the Cockatoo of the Darling, and the enterprising author states that a flight of them flew over the heads of his party from the north-west when he was endeavouring to ascertain the final course of the Lachlan. The species is beautifully figured in Lear's 'Parrots,' and in the volume on Parrots by Sir W. Jardine and Mr. Selby. (*Naturalist's Library*, 'Ornithology,' vol. vi.)

In the same family of *Plyctolophinæ* Mr. Vigors places his genus *Calyptorhynchus*, the chief difference between which and *Plyctolophus* consists in the greater elevation and comparative shortness of the bill. The species appear to be confined to Australia. Of *Calyptorhynchus Banksii*, *the Banksian Cockatoo*, Mr. Caley says, 'The native name of these birds is *Geringora*. I have met with them in various parts of the country. In the north rocks, a few miles to the northward of Paramatta, I have frequently seen them, but never many together. The natives tell me it breeds in winter in *Mun'ning-trees*, or *Blood-trees* of the colonists (a species of *Eucalyptus*), but makes no *Co'tora*. It has three young ones, but of the eggs I could obtain no information.'

Of the *Calyptorhynchus funereus*, *Funereal Cockatoo*, Mr. Caley says, 'Its native name is *Wy'la*, so called from the similitude of that word to the sound which it makes. I have never seen them together in any numbers, not more perhaps than half-a-dozen at a time; but I have met with them in many different places. Sometimes they come within half a mile of the centre of Paramatta, where I have shot them in the trees. The natives told me it made its nest in *Yar'ro-trees* (a species of *Eucalyptus*), using only the vegetable mould. It makes no *Co'tora*, but cuts off the small branches of *Apple-trees* (a species of *Angophora*). It has two young ones.'

Mr. Vigors and Dr. Horsfield have no doubt that the following observations in Mr. Caley's notes apply to *Calyptorhynchus Cookii*, *Cook's Cockatoo*. 'The natives,' says the last-mentioned traveller, 'tell me of another kind of Cockatoo (besides *Wyla* and *Geringora*, which they call *Carat*). It is very shy. It scrapes dirt out of the hollow boughs, and makes its nest as the others do. It lays two eggs, the colour of which I did not ascertain. The nest is found by watching the bird into the hole. It does not make *Co'tora*, nor cut off the branches of the trees; but it cuts off *May'rybor'ro* and *Mun'mow* (the fruit of two species of *Persoonia*), without however eating them, before they are ripe, to the great injury and vexation of the natives.' Specimens of these three species of *Calyptorhynchus* and of *Cal. Solandri* will be found in the collection of Australian birds in the possession of the Linnean Society of London.

Here may be noticed the *Aratoo* (*Microglossus* of Wagler), of which the *Goliah Aratoo*, *Microglossus aterrimus*, Wagl., *Great Black Cockatoo* of Edwards, is an example. *Locality*, Papua, Wagiou, New Guinea, and other Eastern Australian Islands.

Psittacus (*True Parrots*).

Mr. Vigors is of opinion that the group of the *Psittacidæ*, to which the name of *Psittacus* should be applied, may perhaps be considered to be that which comprises the *Psittacus Amazonicus* of Brisson and some allied species. That at least, he observes, is the group best known under the old scientific term, and at the same time under the familiar names of *Parrot* in our language and *Perroquet* in the French, which correspond with it.

These *true Parrots* are for the most part inhabitants of tropical America, and their prevailing colour is green. The ash-coloured or grey parrot, *Psittacus erythacus*, Linn., is a native of Africa. This group excels all others in docility and power of imitation.

Mr. Swainson divides the *true Parrots* into two genera, viz.:—

1. *Chrysotis* (*Amazonian Parrots*), which he thus characterises:—

Face plumed. *Wings* rather short; the first and second quills graduated, and shorter than the third and fourth, which are the longest; all these have the inner web sinnated in the middle; tertials very long. Tail short, longer than the wings, broad, with the tips rounded.

The species of these *Green Parrots* are numerous: among them the *Festive Parrot* (*Psittacus festivus* of authors) and the *Amazon's Parrot* (*Psittacus Amazonicus* of authors) are perhaps the best known; the latter particularly, which is often brought to Europe on account of its superior mimic propensities. The former, which exceeds the *Amazon's Parrot* in size, inhabits Guiana and the Brazils, the banks of the Marañon, or river Amazon, particularly, living in the forests upon seeds and kernels of fruits. It articulates, with great clearness and precision, words, and even sentences. The smaller *Amazon's Parrot* is common in Guiana and Brazil, and more especially near the banks of the river from which it takes its name. Fruits form its food, particularly those of the *Rhizophora Mangle*, or *Mangrove-tree*, and in its decayed trunks the bird deposits its eggs. It is considered very destructive to orange plantations. In captivity it may be taught to repeat many words and short sentences, which it learns with great facility.

Sloane, in his account of the *Common Parrot of Jamaica*, says that it is lesser than those of the main, and has a reddish-coloured neck, being everywhere else of a green colour; that it has a short broad tail; speaks very articulately; and that it is eaten baked in pies, tasting like pigeons.

2. *Psittacus*.

Generic Character.—Wings lengthened, nearly as long as the tail. Face naked. Tail even; the feathers rounded. The Old World. (Sw.)

The *Common Grey Parrot*, *Psittacus erythacus*, is generally considered to be superior to all others in docility and mimicry: its imitation of the human voice, when well taught, is complete, and its articulation most clear. Very high prices have been given for clever and well-taught birds. The parrot for which the Roman cardinal gave a hundred gold pieces had, it is said, learned to repeat with clearness, and without hesitation, the whole of the apostles' creed, a wonderful instance of memory and imitation. This species is very long-lived. Le Vaillant mentions one that he saw which had been domesticated ninety-three years: it was indeed then in a state of decrepitude, and both sight and memory were gone.

Wagler's genera, *Electus*, *Pionus*, and *Psittacodis*, vary in some points from *Psittacus*; the former, *Electus grandis* (Moluccas and New Guinea), approaches the Lories.

The Australian genus *Nestor*, of the same author, is pointed out as forming a connecting link between the *Parrots* and the *Cockatoos*, and is thus characterised:—

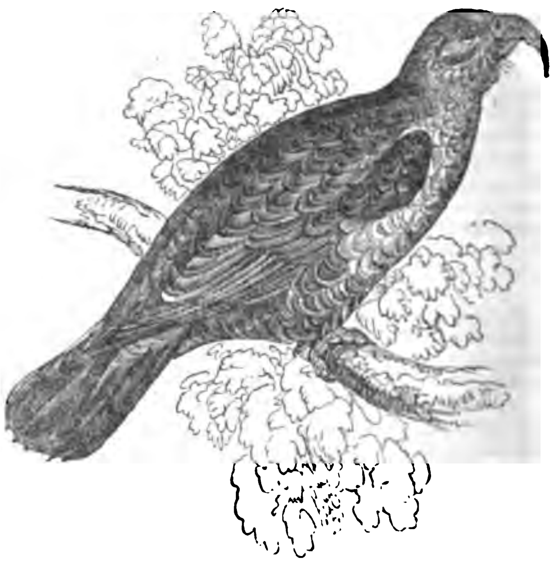
Bill elongated; upper mandible compressed, hooked; the tomia sinuated, but not distinctly toothed; the tip projecting, with its under surface sulcated and deeply excavated for the reception of the tip of the under mandible; under mandible narrow, compressed, slightly convex, or forming, when closed, an obtuse angle with the upper; wings rather long, ample; tail of moderate length, and even at the end; tips of the shafts bare, and slightly projecting beyond the feathered parts.

Example, *Nestor Productus* (*Long-billed Parrot*, Gould).

Description.—General colour of the upper surface brown; beak elongated: head and back of the neck tinged with grey; the feathers of these parts, as well as of the back, margined with a deeper tint; rump, belly, and under tail-coverts, deep red; cheeks, throat, and chest yellow, the former tinged with red; shoulders, on their inner surface, yellow, tinged with rufous-olive; tail-feathers banded at the base with orange-yellow and brown, the inner webs of the quill-feathers at the base and beneath with dusky-red and brown; bill brown; feet blackish-brown. Total length fifteen inches. (Gould, *Birds of Australia*.)

Locality.—Norfolk Island and the most eastern portions of South Wales.

Habits, &c.—'Like all the other members of this extensive family,' says Mr. Gould, in his splendid work on the Birds of Australia, speaking of this species, 'it bears captivity remarkably well, readily becoming cheerful and contented; at least such is the case with an individual in the possession of Sir J. P. Millbank, Bart.; and, as might have been reasonably expected, the variation in the form of the mandibles, which renders these birds so conspicuous, is accompanied by a marked difference in the nature of their food, the powerful bills of the other members of the family enabling them to feed upon hard seeds and stony fruits, while, from the elongated form of this organ in the present birds, this power is denied to them, and we find that they give a decided preference to the leaves of succulent plants and the softer kinds of fruit. Sir J. P. Millbank informed me that the bird in his possession evinced a strong partiality to the leaves of the common lettuce and other soft vegetables, and that it was also very fond of the juice of fruits, of cream, and butter. Its voice was hoarse and inharmonious, frequently resembling the barking of a dog; and in Yates's "New Zealand" we are informed that the *Nestor hypopolius*, known there by the name of *Kaka*, is "capable of learning to imitate the human voice to a remarkable degree. . . . The cry of this bird, when ranging at large in the woods, is harsh and disagreeable in the extreme." Although I cannot assert it for a certainty, I have every reason to believe that both these birds frequently descend to the ground and grub up with their lengthened bills the bulbous and other roots which form a portion of their food, particularly as I have found earth still adhering to the mandibles of the specimens I have examined; besides which, I have been informed by Captain Sturt that a parrot inhabiting Australia, having a similar bill, but belonging to another group, is frequently in the habit of so doing.'



Nestor productus.

The genera *Psittacula* and *Agapornis* appear to be the most diminutive of this extensive and interesting tribe. The latter, a ready example of which occurs in the *Love-Birds*, so extensively petted, and remarkable for their sexual attachment, was separated from *Psittacula* by Sir W. Jardine and Mr. Selby.

The following cut will give some idea of the form of Psittacula (*Poicephalus* of Swainson).

The student should carefully consult the monograph of Kuhl, and that of Wagler*; and of illustrated works should direct his attention more particularly to *Le Vaillant's Perroquets*, with figures after the celebrated Barraband. Lear's *Parrots*; Swainson's *Zoological Illustrations*, 1st and 2nd series; and Selby's *Parrots*, containing many beautiful figures after Lear, though on a small scale, and forming the 6th volume of the *Ornithology* of the *Naturalists' Library*.

Those who keep birds belonging to this group would do well to study their natural habits, if they wish to keep them

* 'Transactions of the Royal Academy of Munich.'

Psittacula Taranta.

in health. Some, as we have seen, live upon the nectar of flowers, others on soft fruits, and others again on hard fruits, for breaking which they are gifted with a powerful vice of a bill. We have known a case where the upper mandible of the bill of a parrot of this last description, which had been kept upon soft food, grew to such a length as to begin to penetrate its throat. To such a moderate proportion of hard food, such as almonds, and even harder food, should be presented. Some of the tribe have bred in captivity; and there is little doubt that if pairs were kept in good roomy cages, with a part of them so fitted up as to remind them of their favourite hollow trees, and furnished with dry rotten wood or vegetable earth, the instances would be comparatively frequent.

PSITTIROSTRA, M. Temminck's name for a genus of granivorous birds, which he places between the Crossbills (*Loxia*) and the Bullfinches (*Pyrrhula*).

Generic Character.—*Bill* short, very much hooked, a little convex at its base, upper mandible curved at the point over the lower one, which is very wide (evasée), rounded and obtuse at the point. *Nostrils* basal, lateral, half closed by a membrane covered with feathers. *Feet*, tarsi longer than the middle toe; all the toes divided, lateral, and equal. *Wings*, first quill null*; second rather shorter than the third. (Temminck.)

Example, *Psittirostra Psittacea* (*Loxia Psitticea*, Lath.; *Psittirostra icterocephala*, Temm.).

M. Temminck remarks that the above is the only species known to him, and that it is found in New Holland; but he adds that he possesses a portrait of a second species, which is green, with a grey beard.

Description of Psittirostra Psittacea.—*Male.*—Head and part of the neck yellow: body entirely green olive-brown, paler below; edge of the quills and tail-feathers yellowish; tail equal; legs pale brown.

Female.—Plumage nearly the same as that of the male, but without yellow on the head, which is green and yellowish-grey upon the temples.

M. Temminck observes that this genus has the bill formed nearly like that of the Parrots, and remarks that if its toes were disposed in pairs, and nothing were known of its habits, it might be classed with them.

Mr. Swainson places the form in his subfamily *Pyrrhulinæ*, family *Fringillidæ*, between *Spermophila* and *Corythus*.

PSKOW was formerly a part of the government of St. Petersburg, and afterwards of that of Novogorod, but it was erected into a separate government by the empress Catharine II. It is situated between 56° and 58° N. lat., and between 27° 20′ and 32° 5′ E. long. It is bounded on the north-west by lake Pskow, on the north by the government of St. Petersburg, on the north-east by Novogorod, on the east by Twer, on the south-east by Smolensk, on the south-west by Witepsk, and on the west by Livonia. The area, according to the survey of 1797, is 15,183 square miles, which M. Arunoff increases to 16,128 square miles, both which are undoubtedly below the truth; but Storch, who is followed by Hassel, Schubert, and lastly, in 1838, by Koppen, makes it 21,950 square miles, which Schmidtlin thinks is perhaps too much. The population, according to Koppen, is 705,300; but Hassel, in 1820, would make it 783,000; and Hörschelmann, in 1833, states it at 900,000. It must be observed that he makes the area only 16,800 square miles.

* Sic in orig.

Face of the Country, Soil, Climate.—The surface is level, and in some places slightly undulating: there are no mountains, though the whole country is rather elevated. The soil is partly clayey, partly sandy, and in many parts covered with a tolerably thick layer of mould. The eminences and the banks of the rivers contain limestone and sandstone. Boulders of granite are not rare, and are most numerous where there is an extensive plain. The only large lake is Lake Pskow, which is, properly speaking, a bay of Lake Peipus, with which it is connected by a broad channel. The Polista, Podso, Khwat, and Woiskoe lakes are much smaller; there are also numerous meres and many marshes, principally in the south-east part of the government. There is no large river in the province. The Düna rises in it, but soon turns into Witepsk; the Loweth, which also rises in it, runs into Novogorod, is joined by the Polista and the Pola, and has below Velikie Luki several rocks and whirlpools, which are called cataracts. Other rivers are the Welikaja, which runs to the north-east, and empties itself into Lake Pskow; the Szelon, which runs into Novogorod, and falls into Lake Ilmen; and the Toropez, which falls into the Düna. Most of these rivers, though not deep enough for large vessels, are however navigable by struses* and other barks, and therefore extremely useful to the government by giving it a communication with Petersburg, Narva, and Riga.

As the whole province is beyond the 56th parallel, the climate is cold.

Natural Productions.—Agriculture is the chief occupation of the inhabitants. The soil is in general tolerably fertile, but requires careful cultivation and manure; it produces however not only sufficient for the consumption of the inhabitants, but an annual surplus of about a million of chetwerts† for exportation. The grains chiefly cultivated are rye, barley, oats, and buckwheat; and of pulse, peas, beans, and lentils: very little wheat is grown. Culinary vegetables, such as cabbages, turnips, onions, garlic, and cucumbers, are cultivated. No fruit is to be seen, at least in the gardens of the peasants, who do not plant a cherry or an apple tree, but content themselves with the wild berries which grow in abundance in the woods and the marshes. On the estates of the nobility small orchards are here and there to be seen. Flax and hemp, both of excellent quality, are staple productions. The extensive forests furnish abundance of timber, chiefly pines, firs, birches, and alders: the oak, maple, and lime-tree are rare. The breeding of cattle is merely subservient to agriculture. The oxen are mostly of the Russian breed, and so are the horses, to which more attention is paid. Besides Russian sheep there are many of German breed. Swine are kept in great numbers, but only few goats and a little poultry. Birds and hares are scarce, and it is seldom that a stag or deer strays hither from the forests of Lithuania. But beasts of prey and fur-bearing animals abound, such as bears, wolves, lynxes, foxes, martens, squirrels, and badgers. Beavers and otters are nearly extinct. The lakes and rivers produce abundance of fish. The only mineral products are bog-iron, limestone, sandstone, and clay. There are salt-springs near the Szelon, but no use is made of them.

Manufactures and Trade.—The inhabitants excel in dressing skins and manufacturing leather; but, unlike the Russians in general, they have not a turn for mechanics, and do not willingly apply to any kind of handicraft. The countrywomen hardly spin wool and flax sufficient to manufacture linen, stockings, &c. for their own use. Some struses and barks are built, and there are many sawmills; the distilleries of brandy are few in number. There are three or four glass-furnaces. Some improvement has undoubtedly been made of late years, yet still, with the exception of Russian leather, the exportation of the government is confined to its own natural productions—rye, oats, barley, squared timber, masts, spars, planks, hemp, flax, hempseed and linseed, wool, hides, and a few other articles, which are sent to Pernau, St. Petersburg, and Narva, whence the inhabitants import colonial produce and other necessary articles.

* A very flat river boat, for the conveyance of timber, straw, &c. On the Wolga they are very large, have masts erected on them and have oars and a sail.

† The chetwort, according to Kelly (*Cambist*), is nearly 6 bushels (5·96).

Religion and Education.—The great majority of the inhabitants are Russians of the orthodox Greek religion. In the north-east part of the government there are a few Finns, in the western circles some Livonians, and near the chief town a colony of Esthonians, who, except that they retain their own dialect, are quite blended with the Russians, and have even embraced the Greek religion. There are also many Germans in the towns. The Greek church is under an archbishop, who has 450 churches, nine of which are cathedrals, and eight monks' and three nuns' convents in his diocese. In 1776 there were only 299 churches. Education is at an extremely low ebb in this government. According to Schmidtlin, in 1835, there were only 41 schools, with 47 masters, and 1248 scholars, besides seven schools belonging to the clergy, with 24 masters and 870 scholars; in all 2110 scholars—one to 300 of the population; and there was only one printing-office, which belonged to the crown. This statement however was given in 1832; and though we have no later detailed official statement, it is certain that considerable improvement has since been made.

The government is divided into eight circles, those of Pskow, Porkhow, Ostrow, Nowershew, Opotschka, Welikaja-Luki, Toropez, and Kholm.

PSKOW, the capital of the government, is in 57° 40′ N. lat. and 28° 10′ E. long., on the left bank of the Welikaja, nearly five miles from its mouth in Lake Pskow. This town has acted a conspicuous part in the history of Russia. It is said to have been founded in the tenth century by the grand-duchess Olga. It appears to have been at first surrounded with a rampart of earth, and in the thirteenth century with a stone wall. At present the interior of the city has some resemblance to that of Moscow. In the centre of the town is the Kremlin, on the steep left bank of the river, which was erected by the brave Prince Dowmont, who reigned from 1266 to 1299, whose remains are deposited in the antient cathedral, where his sword is preserved, with the inscription, 'Honorem meum nemini dabo.' The middle town, extending in the form of a semicircle about the citadel, is also surrounded with a wall; a third very high and strong wall, five miles in extent, defends the great town, which envelopes the middle town. The fortifications, erected in 1701, by Peter the Great, have almost entirely disappeared. There is also a large suburb. Pskow must have been formerly a very populous city, if it is true that, in 1466, 48,000 inhabitants were carried off by the plague. It has sustained several memorable sieges, among others, in 1614, when it was attacked without success by Gustavus Adolphus, king of Sweden.

Pskow has sadly declined from its antient power and greatness, but is still a large town; it has one cathedral, richly adorned with gilding and carved-work, fifty-nine other Greek churches, in not more than half of which divine service is performed, a Lutheran church, three monasteries, an ecclesiastical seminary, a gymnasium, a district and other schools, an orphan asylum, and a handsome building for the government offices. It is the see of the Greek archbishop, and the residence of the military governor. The present population is 12,000, who manufacture Russia leather, linen, sail-cloth, and glass.

TOROPETZ, the chief town of the circle of the same name, has, according to Hassel, Hörschelmann, and others, a population of 12,000, but Schmidtlin says that it does not exceed 7500. It is an antient town, extremely well situated for carrying on an extensive trade, communicating with Riga by means of the river Toropa, on which it is situated, and which joins the Düna. There are thirteen churches and two convents in the town. Most of the houses are of wood.

The Germans call this government Pleskow or Pleskau, which is probably the right name, and the most antient that the town bore, for the historian Cedrenus calls it Pliscoba.

(Hassel; Stein; Hörschelmann; Schmidtlin, *La Russe et la Pologne;* and Russian official journals.)

PSO'PHIA. [AGAMI, in which article the scientific name of the bird is erroneously spelled *Trophia.*]

Mr. Swainson places the form in his family *Megapodinæ (Megapodidæ)*, between the *Dicholophus* and *Crax*. [MEGAPODIIDÆ.]

Mr. G. R. Gray arranges *Psophia* under his family *Ardeidæ*, in the subfamily *Psophinæ*, which consists of that genus and *Cariama* (*Dicholophus*, Ill.) only.

PSORA. [ITCH.]

PSORA'LEA (so called from the Greek psoraleos (ψωραλέος), *warted*, on account of most of the species being covered with little tubercles), a genus of Papilionaceæ, of the natural family of Leguminosæ, characterised by the tube of the permanent calyx being sprinkled with callous points. Sepals five, united to the middle; stamens ten, usually diadelphous. Legume indehiscent, one-seeded, sometimes ending in a beak. Leaves of various forms. Flowers blue, white, or purple. The species, about sixty in number, and natives of different parts of the world, are either herbaceous plants or low shrubs, some of them ornamental, and all of easy culture. They may be propagated either by cuttings or seeds, which they produce abundantly. *P. esculenta*, the bread-root of North America, is cultivated along the banks of the Missouri and in other parts of that country. The roots, which abound in farinaceous matter, are, like the tubers of the potato, employed as food, especially during the winter months. In this climate it will grow in the open air, but requires the protection of a frame to produce abundant crops of roots. P. corylifolia is diffused over every part of India, especially in the vicinity of villages, during the rainy and cold seasons. It is employed as a stomachic and deobstruent. Other species are also used medicinally. P. glandulosa is called in Chili, coulen, culen, or cullen. Some of the native tribes make a very intoxicating kind of beer from a variety called yellow cullen.

PSORI'ASIS is a disease of the skin distinguished by slightly raised red patches of various extent and form, and generally covered with whitish scales. Several varieties of the disease have received different names, according to the form and severity of the eruption in each, and many others, according to the part chiefly or alone affected. The former varieties are Psoriasis guttata, P. diffusa, P. gyrata, and P. inveterata; among the latter are P. ophthalmica, P. palmaria, &c.

Psoriasis guttata is a mild form of the disease, consisting of small red patches two or three lines in diameter covered with very fine white scales. It occurs in various extent on all parts of the body, but most rarely on the face. At first small red spots appear, and soon after present white scales at their centres; then the spots gradually enlarge and the scales increase in number, till the redness begins to fade at the centre, and as the scales fall off, the skin slowly assumes its natural colour. The eruption is attended by a moderate itching, and by very slight symptoms of general disorder.

P. diffusa is in every respect a more severe form of the disease. The spots are large and irregular, and often confluent, and covered with thick scaly incrustations. It appears most frequently on the limbs and around the joints, often covering the whole of a limb with one scaly or raw-looking patch, and sometimes occurring at once and with equal severity on several parts of the body. The skin beneath the scales is very tender and irritable; it often cracks and discharges a thin ichor, which concretes about the fissures, and is attended by considerable pain and irritation, and some constitutional disturbance. The eruption often breaks out successively in different parts of the body, so that it is common for the disease to be protracted for several months and even for years.

P. inveterata is only (as its name implies) a yet less curable form of the same disease. The skin has its whole texture thickened and hard, its surface is covered by a furfuraceous deposit, and in the neighbourhood of the joints it is often very deeply and painfully cracked. The preceding forms are commonly met with in those who are otherwise in pretty good health; but this rarely occurs, except in those whose constitutions are enfeebled by long disease or want.

P. gyrata is a slight but very rare variety, distinguished by the patches occurring in stripes of a singularly tortuous or serpentine form.

Of the local varieties of Psoriasis, the most interesting is that which occurs on the palms of the hands, and which, being most frequent in those who work with light powders and other irritating substances, is commonly called bakers', or bricklayers', or washerwomen's itch.

Psoriasis, in all its forms, is difficult of cure. The general condition of the health being corrected by the means that in each case seem appropriate, the remedy which is most frequently successful in cases of long standing is arsenic, in the form of from three to five drops of the Fowler's solution three times a day, for an adult. Active purging is also often useful, especially in recent cases and in young subjects. Another good remedy is tincture of cantharides, in doses of from three to five drops (for an adult) in water once or more in the day; but the effects of both this and the arsenic require to be carefully watched during their administration, and they must be discontinued as soon as they appear to produce any sickness or heat in the stomach. In addition to these, various other internal means have been recommended, and sometimes found useful, as decoctions of Dulcamara, mezereon, and orchis, antimony, sulphur, &c. Indeed, in many cases it is found necessary to try one means after another without any rule, till one is found which produces benefit. External remedies are generally of less value than internal. The most approved are vapour and sulphur baths, and ointments or lotions containing very small quantities of nitrate of mercury, or white precipitate, or creosote, or alkalis. These however can only be employed in the later stages of the disease: in the earlier, the mildest fomentations give relief, and all kinds of irritants must be carefully avoided.

PSYCHE (Ψυχή). Apuleius is the first writer who relates the loves of Cupid and Psyche (*Metamorph.*, lib. iv., v.). According to his account, Psyche was the most lovely creature that the world ever beheld. People flocked from all parts to see her, and neglected the worship of Venus, who became in consequence so incensed against her, that she commanded her son to inspire Psyche with love for some vile creature. Cupid however, instead of obeying the commands of his mother, became enamoured with Psyche, and made her his wife. She was however subsequently deserted by him for disobeying certain injunctions which he had given her. Inconsolable at her loss, she wandered through the world in search of him, and after enduring many trials and sorrows, was at length united to him. Jupiter conferred upon her immortality, and her union with Cupid took place with the approbation of Venus and the other deities. A child was soon afterwards born to them, who was called Pleasure.

Many writers consider the above tale an allegory, representing the union between the divine love and the human soul. The word Psyche signifies in Greek both 'soul' and a 'butterfly.' We frequently find in antient works of art Cupid pressing *Psyche* to his bosom in the form of a butterfly. It is thought by some modern writers that Psyche, or the soul, was personified in the form of a butterfly in the earlier representations of the allegory. When Psyche is represented with a human form, the wings of the butterfly are usually placed on her shoulders.

Though Apuleius is the first writer who mentions the loves of Cupid and Psyche, it is supposed the tale must have been current before his time, as there are many works of art representing this subject, which appear to have been executed before the second century of the Christian æra, which was the time in which Apuleius lived. (*Brit. Museum, Townley Gallery*, vol. i. pp. 147-148, Lond. 1836.)

PSYCHOTRIA, a name variously derived, which is applied to a rather large tropical genus of the division of the great family of Rubiaceæ which is called Cinchonaceæ. It is characterised by having a calyx 5-parted, somewhat entire; corolla regular, funnel-shaped, five (rarely four) cleft; stamens five, rarely four, exserted or included within the throat of the corolla. Stigma bifid. Berry drupaceous, crowned with the limb of the calyx, usually marked with ten ribs, and containing two nuts. Nuts ribbed; single seeded. Trees or shrubs; rarely herbaceous plants. Some of the species are ornamental in foliage, and one, *P. parasitica*, as its name indicates, is found growing on trees in the West India Islands.

Several of the species are supposed to possess considerable medicinal properties. *P. emetica* is a small under-shrub, a native of New Granada on the banks of the Magdalena, and probably of other parts of South America; the *Cephaëlis emetica* of some other authors. The stem is erect, simple, hairy, and tomentose; leaves oblong, acuminate, narrow at the base, membranous, ciliate, rather hairy on the under surface; stipules very short, ovate, acuminate; peduncles few-flowered, axillary, sub-racemose. This species has long been considered as yielding the black or Peruvian or striated Ipecacuanha, which, analysed by Pelletier, gave of emetine 9, fatty matter 2, and of starch and ligneous matter, the latter bearing but a small proportion, 89. *P. herbacea* is an Indian species used for the same purposes. The roots of *P. sulphurea* and of *P. tinctoria* are employed in dyeing.

PSYCHRESTUS, JACOBUS (Ἰάκωβος Ψυχρεστος), a celebrated physician of the fifth century. 'He was very eminent,' says Freind (*Hist. of Physic*), 'for his great insight into philosophy and physic, which he learned from his father Hesychius (who was also a physician), and who had travelled into a great many countries in the pursuit of knowledge. He was made count and archiater to Leo the Great, or the Thracian (who reigned from A.D. 457 to 474), and was so much beloved by this emperor and the people, that the senate set up a statue for him in the baths of Zeuxippus, built by Severus. (Malelas, *in Vitâ Leonis*.) Isidore of Gaza, called by others the Pelusiote, who flourished in the time of Justinian, saw another erected to him at Athens. (Photius, § 359.) And this author gives a further account of him, that he was an Alexandrian, though his family was originally derived from Damascus; that he had great experience in physic, and did many wonderful cures; that in his practice he frequently ordered clysters and suppositories; that in surgery he seldom made use of fire or the knife, and was no friend to bleeding. He was preferred to all the modern physicians by his scholar Asclepiodotus, who grew famous for reviving the use of white hellebore, which in that time had grown quite out of vogue, and was not so much as known to Jacobus himself. Suidas is still larger in his praise of this Jacobus, and says he attained to a perfect knowledge in physic, both in theory and practice: that he excelled all his contemporaries, that he might be compared to the antients, and was superior to many of them; that he was beloved and adored by his patients, who thought him inspired by heaven; that they had an implicit faith in him, because they never found his prognostic fail. Such an eagerness had he for improving his own art, that they thought the soul of Æsculapius was transfused into him. Kuster tells us he has retrieved his true name Ψυχρεστος out of Malelas, whereas in the former editions of Suidas it was printed Ψυχόχρηστος; however, in the translation of Aëtius (*Tetrab.*, iii., Serm. 4, cap. 43, col. 608), we read Psychristus. But I have reason to believe that both these readings are wrong; and if we consult Alexander Trallianus, we shall plainly discover that it ought to be read Ψυχάρεστος or Ψυχρόχρηστος (for it may be either), as Φιλόχρηστος; for he says in express terms that this name was applied to him, ὅτι ἐγρηγορότως τροφῇ ἐκέχρητο (lib. v., cap. 4, p. 249, ed. Basil). Alexander gives him the epithet of θεοφιλέστατος, and Suidas, after him, calls him θεοφιλής: and therefore there must be an error in the text of Photius, where he and his father it is said ἀσεβεῖς φασίν: and whoever attends to what follows in Photius, will perceive it ought to be read εὐσεβεῖς.' To this account by Freind, it should be added that (apparently to increase his influence over his patients) he pretended to be able to divine their thoughts as well as to distinguish their diseases. Some of his medical preparations are preserved by Alexander Trallianus (pp. 645, 649), but he does not appear to have left any works behind him. (See also Kühn, *Additam. ad Elench. Medicor. Veterum à J. A. Fabricio in Bibl. Gr. Exhibitum*, 4to., Lips., 1832, Fascic. xvii.)

PSYLLA (Geoffroy), a genus of insects belonging to the family *Aphidæ*, which, according to Latreille, forms the second family of the Homopterous *Hemiptera*.

The Psyllæ are minute insects, allied to those commonly called plant-lice, and live upon trees and plants, from which they derive their nutriment by suction, and in so doing they often produce excrescences somewhat resembling gall-nuts, particularly on their leaves and buds. They have two joints to the tarsi; the antennæ are composed of ten or eleven joints, the last of which have two bristles: both sexes have wings, and they possess the faculty of leaping. Their larvæ usually have a very flat body, broad head, and the abdomen rounded behind: the legs are terminated by a little membranous vesicle accompanied beneath with two hooks. Four wide and flat pieces, which are the sheaths of the wings, distinguish the pupa state; several of the species in this stage, as well as in the larva state, are covered with a white substance resembling cotton. The species are very numerous, and are often named after the plants which they infest. Mr. Stephens records twenty-six species as natives of this country.

PSY'LLIUM, a name of a plant which occurs in Dioscorides, &c., supposed to be so named from Psyllus (ψύλλα), a flea, from the resemblance of the seeds to that insect. The plant, Plantago Psyllium of botanists, is common in the south of France; its seeds are small, oblong and flattish, smooth, slippery, and shining, abounding in mucilaginous matter, whence their decoction is employed as a demulcent, and for many of the same purposes as linseed tea is in this country. They are also employed by the manufacturers of muslins, and hence form an article of commerce in the south of France. It is remarkable, according to Dr. Royle, that in the Eastern countries, where translations of Dioscorides continue to be employed for the description of medicinal plants and drugs, the seeds of another species of Plantago, the *P. Ispaghula* of Roxburgh (from the Persian Ispagool), should be employed for and considered identical with the *fuslioon*, that is, the psyllium of the Greeks.

PTARMIGAN. [TETRAONIDÆ.]

PTEROCARPUS (from πτερὸν, *a wing*, and καρπός, *fruit*, from its pod being winged), a genus of the natural order of Leguminosæ, containing many plants valuable for the nature of their products, and all of which are found indigenous in the tropical parts both of the Old and New World. The calyx is 5-cleft, corolla papilionaceous, stamens 10, ovary long-stalked. Legume indehiscent, irregular, somewhat orbicular, surrounded with a wing, often rugose, and 1-seeded. The species are about 20 in number, forming trees or shrubs. Leaves unequally pinnate, with the inflorescence in axillary racemes or forming terminal panicles. Many of the species, as P. dalbergioides, Marsupium, Indicum, and Santalinum, afford excellent timber; some, as the bark of P. flavus, are employed in dyeing; and others are thought to possess medicinal properties.

P. dalbergioides is a native of the Andaman Islands, where it grows to an immense size, and forms a valuable timber-tree, of which the wood is known as Andaman red wood, from its resemblance to mahogany; but it is redder, heavier, and coarser grained, though that of the root is finer than that of the stem. It was introduced by Col. Kyd into the Calcutta botanic garden in 1794, whence it has been spread into the country. *P. Santalinus*, or three-leaved Pterocarpus, is a native of India, which yields the Red Sandal or Red Saunder's wood of commerce, a substance long known for its employment in medicine, being described in the works of the Arabs under the name of *sundroos*. The tree is distinguished by having the three leaflets roundish, retuse, and glabrous. Racemes axillary, simple, or branched. Stamens triadelphus (5, 4, and 1). The wood from the centre of the tree is imported in large billets, which, when fresh, are of a brilliant red colour, but which gradually deepens by exposure to air, so that the outside becomes blackish-coloured. It is insipid, inodorous, and takes a fine polish, and may be distinguished from Brazil wood by the latter yielding its colour to water alone, whilst the red-sandal wood barely tinges it.

Many of these trees exude a reddish-coloured juice which hardens into a kind of astringent gum. The name of dragon's blood has been applied to that from *P. Draco*, a native of South America and the West India islands, as well as to the similar product of several other trees, while that of *P. erinaceus* has long been considered to be the real Kino of the west coast of Africa.

This substance seems to have been first mentioned by Moon, in his travels into the interior of Africa, as quoted by Murray, 'App. Med.,' vi., p. 202, as a red gum issuing from incisions in trees, which he mistook for dragon's blood. Dr. Fothergill introduced this into British practice in 1757, having been first indebted to Dr. Oldfield for information respecting its virtues. The red astringent gum, or Kino, as it was called, was said to have been procured out of a ship from the coast of Africa. Mungo Park discovered a tree, which he found called *pao de sangue* by the Portuguese, on the coast of Senegal, and which was afterwards ascertained to be P. erinaceus of Lamarck. Substitutes were early introduced for this substance, so that doubts may be entertained respecting what was originally employed, as the name Kino is so similar to the Sanscrit and Hindu names, *Kinsuka* and *Kuenee*, of the gum of Butea frondosa, which is, no doubt, one of the earliest substitutes for this substance. [KINO.]

P. Marsupium is another species, a native of the Circar Mountains of India, and grows to a large tree. It also exudes a red juice which hardens into a strong simply astringent gum of a dark red colour, so much resembling that of the Butea frondosa, that, according to Dr. Roxburgh, the same analysis might answer for both. [KINO.]

PTERO'CERAS. [STROMBIDÆ.]

PTE'ROCLES. [TETRAONIDÆ.]

PTERODACTYLE (*Pterodactylus* of Cuvier; *Ornithocephalus* of Sömmering), a genus of fossil *Saurians*, whose type is entirely extinct.

To Collini, the director of the elector-palatine at Mannheim, we are indebted for the first introduction of this Heteroclite. He described the skeleton of the long-billed species from a specimen, found at Aichstädt near Solenhofen, in that Museum, and figured it in the 'Memoirs of the Palatine Academy' (Part. Phys., v. 58, et seq.).

Collini had well made out the head, the neck, the retrograde direction of the trunk, the small tail, the left leg, and the two arms; but beyond this he seems to have been at a loss. He came to the conclusion that the animal was neither a bird nor a bat; inquired whether it might not be some amphibian; and finished by expressing his opinion that the type must be sought among the marine *vertebrata*.

Blumenbach took a widely different view of the subject, and referred this extraordinary form to the Palmipede, or web-footed birds.

Professor Hermann of Strasburg, who drew upon his imagination for a restoration of the animal, and clothed it in a hairy skin, considered it to be a mammal, and assigned to it a situation between the mammiferous class and birds, still more intermediate than that occupied by the bats.

Sömmering also arranged the form among the mammals, in the neighbourhood of the bats, not without an elaborate detail of the reasons which had conducted him to that conclusion.

It was reserved for the penetrating eye and acute but patient investigation of Cuvier effectually to destroy these theories, supported though they were by weighty authorities: the satisfactory reasoning by which he disposes of them one after the other, and proves conclusively from the organization of the animal that it was a Saurian (in which opinion he was supported by Oken) will be found at large in the fifth volume of the last edition of his *Ossémens Fossiles*. Our limits will not permit us to detail the links of the harmonious chain of his proofs; and we must here content ourselves with observing that the form of the *os quadratum* appears to have been the principal key by which the great French naturalist solved this intricate zoological puzzle, and detected its Saurian character. 'Behold,' says he, after having built, as it were, the animal before our eyes, 'an animal which, in its osteology, from its teeth to the end of its claws, offers all the characters of the Saurians; nor can we doubt that those characters existed in its integuments and soft parts—in its scales, its circulation, its generative organs. But it was at the same time an animal provided with the means of flight,—which, when stationary, could not have made much use of its anterior extremities, even if it did not keep them always folded as birds keep their wings,—which nevertheless might use its small anterior fingers to suspend itself from the branches of trees, but when at rest must have been ordinarily on its hind feet, like the birds again; and, also like them, must have carried its neck sub-erect and curved backwards, so that its enormous head should not interrupt its equilibrium.'

Well may Cuvier remark, that of all the beings whose antient existence is revealed to us in his great work above alluded to, these Pterodactyles are the most extraordinary: and that if we could see them alive, they would be the most at variance with living forms. Their flight was not performed by means of ribs as in the dragons [DRAGON]; nor by means of a wing without distinct fingers, like that of a bird; nor by a wing leaving the thumb alone at liberty, as in the bats; but by a wing sustained principally on one very elongated finger, whilst the rest preserved their ordinary brevity and their claws. At the same time these flying reptiles—a denomination almost contradictory—have a long neck, the bill of a bird, everything in short that could conduce to give them a strange aspect. (*Oss. Foss.*)

Dr. Buckland (*Bridgewater Treatise*) ranks these flying reptiles among the most remarkable disclosures made by geology, and considers them as presenting more singular combinations of form than we find in any other creatures yet discovered amid the ruins of the antient earth. He calls attention to the extraordinary discordance of opinion respecting a creature whose skeleton was almost entire, and observes that this discordance arose from the presence of characters apparently belonging to each of the three classes to which it was referred; the form of its head and length of the neck resembling that of birds, its wings approaching to the proportion and form of those of bats, and the body and tail approximating to that of ordinary mammalia. These characters, connected with a small skull, as is usual among reptiles, and a beak furnished with not less than sixty pointed teeth presented, he remarks, a combination of apparent anomalies, which the genius of Cuvier reconciled. 'In his hands,' says the Professor, in continuation, 'this apparently monstrous production of the ancient world has been converted into one of the most beautiful examples yet afforded by comparative anatomy, of the harmony that pervades all nature in the adaptation of the same parts of the animal frame to infinitely varied conditions of existence. In the case of the Pterodactyle, we have an extinct genus of the order Saurians, in the class of Reptiles (a class that now moves only on land or in the water), adapted by a peculiarity of structure to fly in the air. It will be interesting to see how the anterior extremity, which in the fore-leg of the modern lizard and crocodile is an organ of locomotion on land, becomes converted into a membraniferous wing; and how far the other parts of the body are modified so as to fit the entire animal machine for the functions of flight. The details of this inquiry will afford striking examples of numerical agreement, in the component bones of every limb, with those in the corresponding limbs of living lizards, and are at the same time illustrative of contrivances for the adjustment of the same organ to effect different ends.'

Dr. Buckland observes that we are already acquainted with eight species, varying from the size of a snipe to that of a cormorant.

Hermann von Meyer enumerates the following named species:—

1. *Pterodactylus longirostris*, Cuv. (*Ornithocephalus longirostris*, Sömm.; *Pterodactylus crocodilocephaloides*, Ritgen).

Locality, Solenhofen. (About the size of a woodcock.)

Pterodactylus longirostris.

2. *Pterodactylus brevirostris*, Cuv. (*Ornithocephalus brevirostris*, Sömm.; *Pterodactylus nettecephaloides*, Ritgen).

Locality, Solenhofen.

Pterodactylus brevirostris.

3. *Pterodactylus crassirostris*, Goldf.

Locality, Solenhofen.

4. *Pterodactylus medius*, Münster.

Locality, Solenhofen.

5. *Pterodactylus Münsteri*, Goldf.

Locality, Solenhofen.

6. *Pterodactylus Macronyx*, Buckland (*Ornithocephalus Banthensis*, Theodori).

Localities, Lyme Regis, Buckl.; *Banz* (Germany), H. von Meyer. (Size about that of a raven; wings, when expanded, about four feet from tip to tip.)

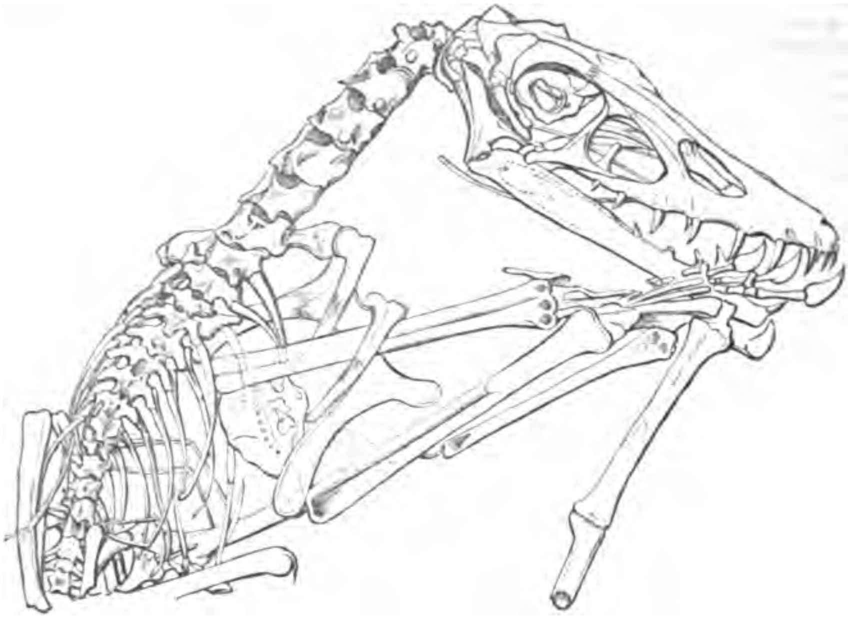
7. *Pterodactylus grandis*, Cuv. (*Ornithocephalus giganteus*, Sömm.).

Locality, Solenhofen? (About four times as large as *Pt. longirostris*.)

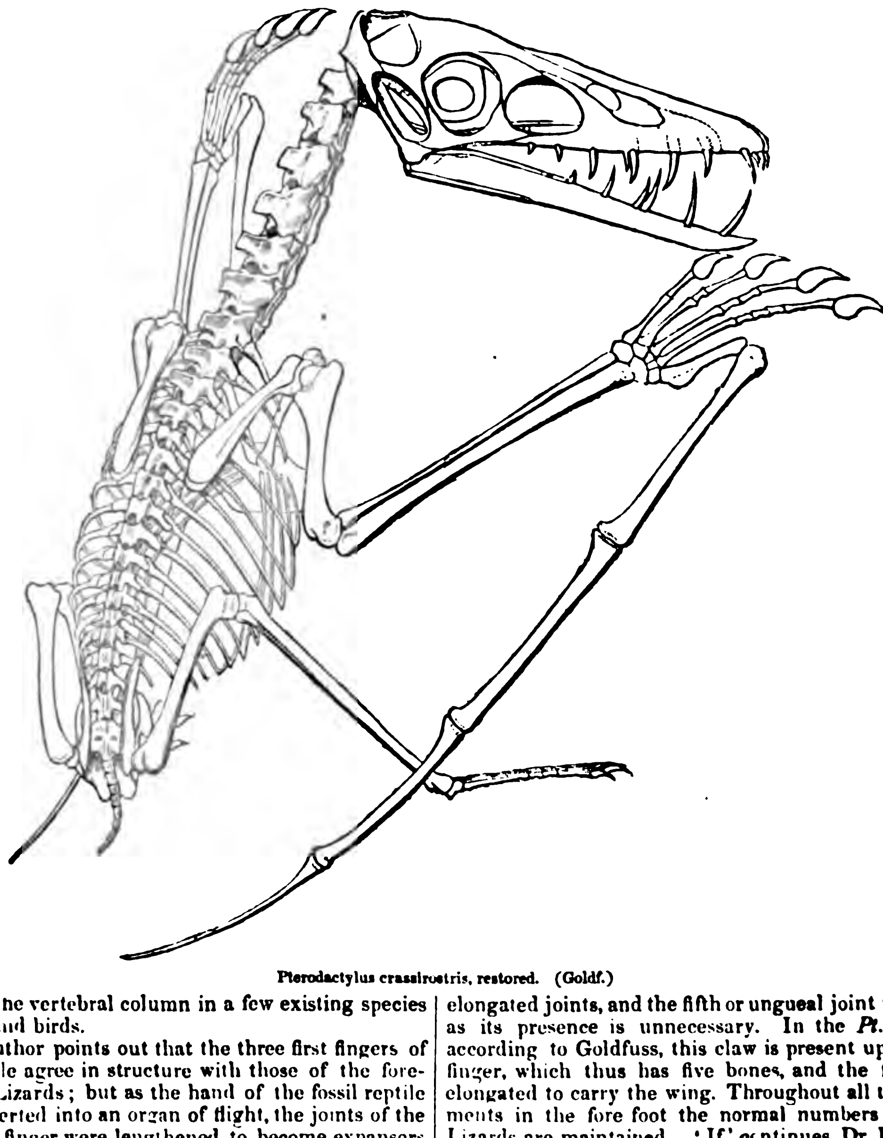
8. *Pterodactylus Bucklandi*, Goldf.

Locality, Stonesfield.

Dr. Buckland remarks that in *Pterodactylus Macronyx* (lias at Lyme Regis) there is an unusual provision for giving support and movement to a large head at the extremity of a long neck, by the occurrence of bony tendons running parallel to the cervical vertebræ, like the tendons that pass along the back of the Pigmy Musk (*Moschus pygmæus*) and of many birds. This provision, he observes, does not occur in any modern Lizards, whose necks are short, and require no such aid to support the head. In the compensation which these tendons afforded for the weakness arising from the elongation of the neck, Dr. Buckland sees an example of the same mechanism in an extinct order of the most ancient reptiles, which is still applied to strengthen



Pterodactylus crassirostris. (Goldf.)



Pterodactylus crassirostris, restored. (Goldf.)

other parts of the vertebral column in a few existing species of *Mammalia* and birds.

The same author points out that the three first fingers of the Pterodactyle agree in structure with those of the fore-foot of living Lizards; but as the hand of the fossil reptile was to be converted into an organ of flight, the joints of the fourth or fifth finger were lengthened to become expansors of a membranous wing. Thus in *Pt. longirostris*, he observes, the fourth finger is stated by Cuvier to have four elongated joints, and the fifth or ungueal joint to be omitted, as its presence is unnecessary. In the *Pt. crassirostris*, according to Goldfuss, this claw is present upon the fourth finger, which thus has five bones, and the fifth finger is elongated to carry the wing. Throughout all these arrangements in the fore foot the normal numbers of the type of Lizards are maintained. 'If,' continues Dr. Buckland, 'as appears from the specimen engraved by Goldfuss, of *Pt. crassirostris*, the fifth finger was elongated to expand the wing, we should infer, from the normal number of joints in the fifth finger of Lizards being only three, that the wing-finger had but three joints. In the fossil itself the two first joints only are preserved, so that the conjectural addition of a fourth joint to the fifth finger in the restored figure, seems inconsistent with the analogies that pervade the structure of this and of every other species of Pterodactyle, as described by Cuvier. According to Goldfuss, this species had one more toe than Cuvier assigns to the other species; in this respect it is so far from violating the analogies we are considering, that it adds another approximation to the character of the living Lizards.' After referring to the difference manifested in *Pt. crassirostris* from the other Pterodactyles, in having the fifth instead of the fourth finger elongated, as above noticed, for the purpose of expanding the wing, Dr. Buckland states that it is however probable that the fifth toe had only three joints, for the same reasons that are assigned respecting the number of joints in the fifth finger; and he observes that in *Pt. longirostris*, Cuvier considers the small bone in the foot to be a rudimentary form of a fifth toe.

Geological Position.—Lithographic limestone of the Jura formation at Aichstedt and Solenhofen, which abounds with remains of fish, and of brachyurous and macrurous crustaceans, and where *Xiphosuri* (*Limulus*) not unfrequently occur. The fish examined by Cuvier belonged, partially at least, to marine genera. He distinguished, for example, a well characterised species of anchovy, probably *Clupea sprattiformis*, Bl. *Libellulæ* and other insects have also been found in this Solenhofen slate. The other localities are Lyme Regis (lias), Banz, and Stonesfield (oolite).

Habits, Food, &c.—Cuvier, speaking of the Solenhofen district, observes that there is no doubt that at the time of the deposit of the lithographic slate, there lived in that canton crocodiles, *Limuli*, and other beings whose geographical distribution is now confined to the torrid zone,* together with these flying Saurians, which flitted about by means of the membrane sustained by a single finger, suspended themselves and perhaps crept by the aid of the other three fingers, stood upon their hind legs only, and had their enormous gape armed with small pointed teeth, fit only for seizing insects and small animals.

Dr. Buckland thinks it probable that the Pterodactyle had the power of swimming so common in reptiles, and now possessed by the Vampire Bat† of the island of Bonin. (*Bridgewater Treatise.*) 'Thus,' says the Professor, 'like Milton's fiend, all qualified for all services and all elements, the creature was a fit companion for the kindred reptiles that swarmed in the seas or crawled on the shores of a turbulent planet:

> "The Fiend
> O'er bog, or steep, through strait, rough, dense, or rare,
> With head, hands, wings, or feet, pursues his way,
> And swims, or sinks, or wades, or creeps, or flies."

With flocks of such-like creatures flying in the air, and shoals of no less monstrous Ichthyosauri and Plesiosauri swarming in the ocean, and gigantic crocodiles and tortoises crawling on the shores of the primæval lakes and rivers, air, sea, and land must have been strangely tenanted in those early periods of our infant world.' (*Geol. Trans.*, *N. S.*, iii., part 1.)

In the 'Bridgewater Treatise' we find the size and form of the foot, and size of the leg and thigh, adduced as showing that the Pterodactyles had the power of standing firmly on the ground, where, with their wings folded, they possibly moved after the manner of birds; and an opinion that they could also perch on trees, and climb on rocks and cliffs, with their hind and fore feet conjointly, like Bats and Lizards.

Cuvier, as we have seen, conjectured that the food of these flying Saurians consisted of insects and other small animals, and he thought that, from the magnitude of their eyes, they may have been also nocturnal. Dr. Buckland refers to the presence of large fossil *Libellulæ*, or Dragon-flies, together with many other insects in the same quarries with the Solenhofen Pterodactyles, and to the occurrence of the wings of coleopterous insects, mingled with the bones of these Saurians in the oolitic slate at Stonesfield, as proof that large insects existed at the same time with them, and that they may have contributed to their supply of food. He adds however that the head and teeth of some species of Pterodactyle are so much greater and stronger than is necessary for the capture of insects, that the larger species of them may possibly have fed on fishes, darting upon the latter from the air, after the manner of Sea-Swallows, or Terns, and Solan Geese. The enormous size and strength of *Pt. crassirostris*, he observes, would not only have enabled it to catch fish, but also to kill and devour the few small marsupial mammalia which then existed upon the land.

* [illegible] South America.
† [illegible]

PTERODICTYUM. [POLYPIARIA.]

PTEROGLOSSUS. [RAMPHASTIDÆ.]

PTEROLOBIUM, a small genus of plants of the natural family of Leguminosæ, so named from its pod ending in a membranous wing. The genus was first mentioned by Mr. Brown, in the appendix to Salt's 'Travels in Abyssinia,' and from a species, the Kantuffa, which is also noticed by Bruce, and described by him as being ordered to be cut away from the roads where the king was going to travel. The genus is found in India as well as in Africa, and even the species Kantuffa occurs there, as it is the Cæsalpinia lacerans of Roxburgh, but referred to Mimosa by De Candolle, and called *M. Kantuffa*; having been ascertained to be identical with the Indian plant and belonging to this genus it has been called Pterolobium lacerans. The genus contains only a few species of trees and climbing shrubs covered with strong sharp hooked prickles.

PTE'ROMYS. [SCIURIDÆ.]

PTEROPLEURA. [GECKO, vol. xi., p. 105.]

PTERO'PODA, Cuvier's tenth class of Mollusks, *Aporobranchiata* of M. De Blainville, who divides the order into the *Thecosomata* and *Gymnosomata*.

Cuvier defines his *Pteropoda* to be mollusks which swim like the cephalopods in the sea, but are unable to fix themselves, or creep there, from the want of feet. Their organs of motion consist only of fins, placed like wings at the two sides of the mouth, and they are stated to be all hermaphrodites.

The following genera compose Cuvier's *Pteropoda*:—

1. *Clio* [CLIO.] 2. *Cymbulia*. [HYALÆIDÆ, xii., p. 371.] 3. *Pneumodermon*. [CLIO, vol. vii., p. 266.] 4. *Limacina*. [HYALÆIDÆ, vol. xii., p. 372.] 5. *Hyalæa* [HYALÆIDÆ, vol. xii., p. 372.] 6. *Cleodora*. [HYALÆIDÆ, vol. xii., p. 373.] and 7. *Pyrgo*, described as a very small fossil shell, discovered by Defrance, globular, very delicate, and divided by a very narrow transversal slit. [THECOSOMATA.]

PTERO'PTOCHUS. [MERULIDÆ, vol. xv., p. 143.]

PTE'ROPUS. [CHEIROPTERA, vol. vii., p. 25.]

PTEROSOMA'TIDÆ. [NUCLEOBRANCHIATA, vol. xvi., p. 360.]

PTEROSPERMUM (from the Greek word πτερὸν, signifying a wing, and σπέρμα, a seed), a small genus of plants of the natural family of Byttneriaceæ, which is found in the Indian Isles and the southern parts of India. The flowers being large and the foliage showy, have induced the cultivation of the species as ornamental trees all over India. The calyx is leathery, five-partite, tomentose outside, hairy within. Petals five, shorter than the calyx. Stamens twenty (five sterile), united at the base into a column with the stalk of the ovary. Style slender, club-shaped. Seeds winged. The genus is small, but all the species form handsome trees, and, like most of the plants of the nearly allied order of Malvaceæ, abound in mucilage.

PTEROTRA'CHEA. [GASTEROPODA, vol. xi., p. 92; NUCLEOBRANCHIATA; ATLANTA; CARINARIA.]

PTERU'THIUS. [LANIADÆ.]

PTILOCHLO'RIS. [VIREONINÆ.]

PTILO'GONYS. [SHRIKES.]

PTILOLEPTUS. [INDICATORINÆ, vol. xii., p. 440.]

PTILONOPUS. [COLUMBIDÆ, vol. vii., p. 460.]

PTILONORHY'NCHUS. [STURNIDÆ.]

PTILO'PACHUS, Mr. Swainson's name for a subgenus of rasorial birds placed by him under the genus *Perdix* in the family *Tetraonidæ*.

Generic Character.—*Bill* small, slender. *Nostrils* naked, very large, occupying one half of the length of the bill. *Wings* rounded. *Tail* broad, rounded, larger and longer than in *Perdix*; the feathers very soft. Feathers of the back and rump with the shafts thickened and apparently spinous, as in *Cryptonyx*. *Tarsus* shorter than the middle toe. Lateral toes nearly equal, claws considerably compressed. (Sw.)

Geographical Distribution of the Genus.—Africa and India. (Sw.)

Example, *Ptilopachus erythrorhynchus*.

Description.—Size intermediate between the quail and the partridge. Ground-colour of the whole plumage earth-brown, just as dark on the body as on the back; this colour is varied by dusky white spots in the following manner:—the feathers upon the neck, throat, breast, interscapulars, and sides of the body have a row of white stripes down the middle of each web, bordering a stripe of rufous which occupies the middle of each feather; these spots (which are most distinct and defined on the interscapulars and sides of the body) are bordered above by a line of obscure black; the spots become indistinct and run into each other on the breast so as to form stripes. The chin and part of the throat is dirty white, each feather being nearly black in the middle. On the fore part of the body, immediately beneath the breast, is a large patch of pale fulvous or buff-yellow. All the rest of the plumage is dark brown, without any other variation than very minute and scarcely perceptible freckles of a paler colour; the quill and tail feathers are without any bands or spots, but there are a few white dots on the wing-covers, and obsolete undulations on the flanks; bill, orbits, and legs light, probably red in the live bird; tail very broad and rounded. Total length about ten inches. (Sw., *Birds of West Africa*, in 'Nat. Lib.') [PERDICIDÆ, vol. xvii., p. 443.]

PTILO'PHYRUS, Mr. Swainson's name for the genus *Lophyrus* [COLUMBIDÆ, vol. vii., p. 370], a change which he proposes because *Lophyrus* was preoccupied to designate a genus of insects.

PTI'LORIS, Mr. Swainson's name for a genus of birds which he arranges under the *Paradisiadæ*, or *Birds of Paradise*.

Generic Character.—*Bill* greatly curved. *Nostrils* basal, plumed; the aperture linear. *Wings* rounded. Tail short, even. *Tarsi* short. *Toes* as in *Meliphaga;* hallux very strong, equal to the tarsus and to the middle toe. Soles flat and broad. (Sw.)

Example, *Ptiloris Paradiseus* (*Rifle Bird*).

Locality.—New Holland.

PTILO'STOMUS, Mr. Swainson's name for a genus of birds which he places under the subfamily *Glaucopinæ* (Wattle-Crows) of the family *Corvidæ*.

Generic Character.—*Bill* shorter than the head, much compressed, the culmen considerably arched, and curved from the base. *Rictus* bristled. *Wings* moderate, slightly rounded; the third, fourth, and fifth quills longest. *Tail* long, cuneated; the feathers lanceolate. *Feet* very strong and robust. *Tarsus* lengthened, longer than the middle toe and claw; lateral toes short, and of equal length. (Sw.)

Geographical Distribution of the Genus.—Africa.

Example, *Ptilostomus Senegalensis* (Sw.), *Senegal Piapec.*

Description.—Size smaller and general form more slender than in the European magpie. Plumage of body above and below sooty black, feathers very soft and silky, and with a soft gloss upon them. On the tertials, and some of the secondaries, close transverse bands of darkly shaded lines, similar to those on the tail-feathers of *Lamprotornis longicauda*, &c. Primary quills and tail light sepia-brown, the former being almost white on their under surface, when held in some directions of light. Tail-feathers much narrowed towards their tips, and their shafts particularly strong. Total length 17½ inches. (Sw.)

Habits, &c.—Mr. Swainson remarks, that from the circumstance of Le Vaillant having found this species to be migratory in South Africa (where it is seen either singly or in small flocks), there can be no doubt that it quits Senegal at certain seasons along with the Grakles, and returns to West Africa to breed. Mr. Swainson infers the latter circumstance from having seen a young specimen from Senegal, before it had quite gained its full wing-feathers. He also remarks that the sharpness and curvature of its claws shows that the bird, although possessed of an ambulating foot, is yet more accustomed to perch upon trees than to walk upon the ground. (*Birds of West Africa.*)

PTILO'TIS. [MELIPHAGIDÆ, vol. xv., p. 82.]

Subgeneric character.—*Bill* short. Lateral *toes* almost equal. *Tail* slightly rounded, sometimes nearly even. (Sw.)

PTILOTU'RUS. [MELIPHAGIDÆ, vol. xv., p. 82.]

I. PTOLEMÆUS (Πτολεμαῖος), surnamed SOTER, or 'preserver,' the founder of the dynasty of Greek kings in Egypt, frequently called the Lagidæ, was one of the ablest of the generals of Alexander the Great. He is commonly called the son of Lagus, but, according to the Macedonians, he was the son of Philip and grandson of Amyntas, but was called the son of Lagus, because his mother was given for wife to Lagus by Philip, though she was then with child. (Paus., i. 6, § 2.)

In the division of the provinces on the death of Alexander, B.C. 323, Egypt was assigned to Ptolemy, who soon took measures to erect it into an independent kingdom. He put to death Cleomenes, who had been appointed satrap of Egypt by Alexander, chiefly because he was well disposed to Perdiccas (Paus., i. 6, § 3), and obtained by his death an immense sum of money, which Cleomenes had collected during his administration. With this money, which amounted, according to Diodorus (xviii. 14), to 8000 talents, he collected a large army. In the first or second year of his rule he took the city of Cyrene and added the Cyrenaica to his dominions. He also obtained possession of the dead body of Alexander, which it had been resolved in the council at Babylon to transport to Ægæ in Macedonia. It was first carried to Memphis, and afterwards to Alexandria.

In the year B.C. 321 Perdiccas invaded Egypt; but he lost 2000 men in attempting to cross the Nile, and was subsequently murdered in his tent by his own troops. [PERDICCAS.] A few years afterwards Ptolemy had to encounter a more formidable rival in Antigonus, who was rapidly increasing in power; and in B.C. 316 he entered into an alliance with Seleucus, Cassander, and Lysimachus, to resist the ambitious projects of Antigonus. In the long war which followed, and of which an account is given in the article ANTIGONUS, Ptolemy took an active part. It was continued till B.C. 312, when a general treaty was made, by which Ptolemy obtained possession of Egypt and the adjacent districts. Ptolemy however was the first to break this treaty in the following year; and the war was again renewed, and carried on with various success, till the defeat and death of Antigonus, at the battle of Ipsus, B.C. 301, secured to Ptolemy the undisturbed possession of Egypt.

From this time to his death, Ptolemy devoted all his energies to develop the resources and promote the prosperity of his kingdom. Under his wise government and that of his successor, Alexandria became, as its great founder had anticipated, the first commercial city in the world, and the place from which Europe was supplied with the rich merchandise of the East. As his subjects consisted of two distinct nations, the Egyptians and Greeks, it was the policy of Ptolemy and his successors to amalgamate these races as much as possible. Ptolemy, being a Greek, introduced Greek habits and customs and also the Greek religion into Egypt; but, like his great master Alexander, he carefully avoided offending the prejudices of his new subjects, and adopted to a certain extent the Egyptian forms of worship. He and his successors conciliated the favour of their subjects, by the respect which they paid to the antient Egyptian priesthood, and also by contributing largely to the restoration of the antient monuments of the country. ('British Museum,' *Egyptian Antiquities*, vol. i., p. 35, Lond. 1832.) He also introduced the most complete religious toleration among all his subjects. The troubled state of Palestine and the growing commerce of Alexandria induced many Jews to settle in his dominions and the same toleration was granted to the Jewish synagogue as to the temples of Isis and Jupiter. Ptolemy seems to have been desirous of uniting as much as possible the Egyptian and Greek religions; and his removal of the statue of Serapis from Pontus to Alexandria, which is mentioned by several antient writers (Tacit., *Hist.*, iv. 84, and commentators), and which was accompanied with great solemnity, seems to have been accomplished in order to establish the worship of a deity which might prove acceptable to both nations.

Ptolemy gave great encouragement to learning and science. He wrote himself a history of the wars of Alexander, which appears to have been a work of considerable merit, and which supplied Arrian, in conjunction with the narrative of Aristobulus, with the materials for his history. [ARRIAN, p. 395.] He invited many scholars and philosophers from Greece, of whom the most celebrated was Demetrius Phalereus [DEMETRIUS], who was received by him with the greatest distinction. He also invited Theophrastus (Diog. Laert., ii. 37), and received Stilpo (Diog. Laert., ii. 115), who had been banished from Athens for his religious opinions. In fact, Ptolemy extended his patronage to all persons of learning, independent of their religious and philosophical opinions. He laid the foundations of that school of learning for which Alexandria became afterwards so celebrated; and he probably commenced making collections for the public library which was regularly established by his son.

Ptolemy Soter was first married to Eurydice, the daughter of Antipater, by whom he had children; but he left his dominions to a younger son, Ptolemy Philadelphus, whom he had by Berenice (Paus., i. 6, § 8; Justin, xvi. 2; Plin., *Hist. Nat.*, xxxvii. 32). [BERENICE.] His eldest son, Ptolemy Ceraunus, murdered Seleucus, B.C. 280, and obtained possession of the kingdom of Macedonia. He only reigned however for about a year, and fell in battle with the Gauls. (Paus., i. 16, § 2; x. 19, § 4; Strabo, xiii., p. 623; Justin, xxiv. 5.)

Ptolemy Soter assumed the title of king, B.C. 306 (Diod., xx. 53; Plutarch, *Demetr.*, c. 18); and died at the age of 84 (Lucian, *Macrob.*, c. 12), B.C. 283, forty years after the death of Alexander. All the antient writers agree in representing Ptolemy as a prince of the greatest wisdom, prudence, and generosity; and there is a saying of his reported by Ælian (*Var. Hist.*, xiii. 12), worthy of Alexander, 'that it was better to make rich than to be rich.'

Coin of Ptolemy and Berenice.
British Museum. Actual Size. Gold.

The two heads to the right are Ptolemy Soter and his wife Berenice. The two heads to the left are Ptolemy Philadelphus and his sister and wife Arsinoe. The words ΘΕΩΝ ΑΔΕΛΦΩΝ, 'the fraternal deities' occur in the Adule Inscription, and apply to Ptolemy Philadelphus and Arsinoe. [ADULE.]

II. PTOLEMÆUS, surnamed PHILADELPHUS, or the 'brother-loving,' succeeded his father, B.C. 283, but was associated with him in the government two years previously. He followed the example of his father in the encouragement of learning; and he maintained with great liberality many distinguished philosophers and poets, of whom the most celebrated were Theocritus, Lycophron, and Callimachus. He established the public library, which was probably commenced by his father, and also founded a museum (*μουσεῖον*) for the promotion of learning and the support of learned men. Some modern writers attribute the foundation of this museum to Ptolemy Soter, but Athenæus (v., p. 203) distinctly ascribes it to Philadelphus. (Clinton, *Fasti Hell.*, iii., p. 380.) We learn from Strabo (xvii., p. 794) that the museum formed part of the palace, and that it contained cloisters or porticos (*περίπατον*), a public theatre or lecture-room (*ἐξέδρα*), and a large hall (*οἶκον μέγαν*), where the learned men who belonged to it dined together. The museum was supported by a common fund, supplied apparently from the public treasury; and the whole institution was under the superintendence of a priest, who was appointed by the king, and, after Egypt formed a province of the Roman empire, by the Cæsar. Attached to the museum there were botanical and zoological gardens. (Philostr., *Apollon.*, vi. 24; Athen., xiv., p. 654.) The institution was enlarged by the emperor Claudius. (Suet., *Claud.*, c. 42, with Casaubon's 'Note.')

Ptolemy Philadelphus showed the same favour to the Jews as his father had done; and it was under his auspices that the Hebrew Bible was translated into Greek. [SEPTUAGINT.] Josephus (*Antiq.*, xii., 2, § 12) has given us an account of the entertainment at which Ptolemy received the translators; and which is interesting, as it affords us some idea of the literary parties which the king appears to have frequently given. The king sat at the head of the table, and the guests on each side. The usual priests, heralds, &c. were sent away, and grace was said by one of the translators at the command of the king. This grace or prayer was received with loud applause by the whole company. After supper the king began to philosophise, and asked every one of his guests a philosophical question.

The treasures and resources of Philadelphus were very great. Much of the wealth which he possessed was, without doubt, owing to his possessing the trade with India and other parts of Eastern Asia. He also used every effort to extend the trade of Alexandria; he obtained possession of the maritime parts of Arabia and of the eastern coast of Africa, and his admiral Timosthenes appears to have gone as far south as Madagascar. (Vincent's *Commerce and Navigation of the Antients, &c.*, vol. i., p. 42.) Theocritus (*Adoniazusæ*) describes in glowing colours the wealth and power of his patron; and his account is confirmed by the less suspicious testimony of Appian, who was himself a native of Alexandria. The latter writer informs us (*Præfatio Histor.*, c. 10) that under the Ptolemies the army consisted of 200,000 foot soldiers, 40,000 horse, 300 elephants, and 2000 war-chariots, and the fleet of 2000 smaller vessels, 1500 triremes, and 800 ships magnificently adorned and equipped for royal use. The money in the treasury amounted to 740,000 Egyptian talents at the death of Ptolemy Philadelphus, who, according to Appian, amassed greater treasure and expended more upon public works than any of his successors. Athenæus also bears testimony (ii., p. 203) to the great power of Philadelphus, and states among other things that he surpassed all other kings in the number of his ships. The power and influence of the Egyptian kingdom under the three first Ptolemies is also attested by Polybius (v. 34), who says that they were masters of Cœle-Syria and Cyprus, and extended their influence over the neighbouring countries as far as Thrace and Macedonia. (Clinton's *Fast. Hellen.*, iii., p. 383.)

The political events of the reign of Ptolemy Philadelphus may be comprised in a few words. He put to death, at the commencement of his reign, two of his brothers, one of whom had endeavoured to excite the Cyprians to revolt. He was also engaged in war with Magas, the son of Berenice by a former husband, who had been appointed governor of Cyrene. Magas, who was married to Apama, the daughter of Antiochus and grand-daughter of Seleucus, prevailed upon his father-in-law to break the treaty which had been made between Seleucus and Ptolemy. Ptolemy however, by assuming the defensive, prevented Antiochus from invading his dominions (Paus., i. 7, § 3), and finally concluded a peace with his successor Antiochus II., by which the latter agreed to repudiate his wife Laodice, and to marry Berenice, the daughter of Ptolemy. [ANTIOCHUS II.]

In B.C. 274 Ptolemy sent an embassy to Rome and formed an alliance with the republic. (Liv., *Epit.*, 14; Eutrop., ii. 15.) We also read of a Roman embassy to Egypt. (Justin, xvii. 2.) Ptolemy sent a naval force to the assistance of the Athenians against Antigonus and the Macedonians (Paus., 1, 7, § 3); and the Athenians in compliment to him called one of their tribes Ptolemais. (Paus., i. 6, § 8; i. 5, § 5.) Ptolemy also founded a gymnasium at Athens, not far from the market-place, which was called after his name, and which contained a bronze statue of him. (Paus., i. 17, § 2.) [ATHENS, p. 11.]

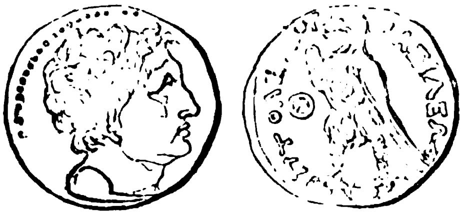
Ptolemy Philadelphus died, B.C. 247, after reigning two years with his father and thirty-six alone. He was married twice; to Arsinoe, the daughter of Lysimachus, and also to Arsinoe, his own sister. [ARSINOE.] Pausanias remarks (i. 7, § 1) upon his marriage with the latter, that in doing so he violated the laws of the Macedonians, but not of the Egyptians. By his sister he had no children, but by the daughter of Lysimachus he had three, Berenice, Ptolemy surnamed Euergetes, and Lysimachus. (Schol. Theocr., xvii. 128, quoted by Clinton.)

III. PTOLEMÆUS, surnamed EUE'RGETES, or the 'benefactor,' succeeded his father B.C. 247. He was engaged in war at the commencement of his reign with Seleucus Callinicus, to revenge the death of his sister Berenice. [BERENICE II.] Great success attended his arms; he obtained possession of many of the provinces belonging to the Seleucidæ, and would probably have overthrown their empire, if he had not been obliged to return to Egypt in consequence of some civil commotions. (Justin, xxvii. 1.) Seleucus tried to strengthen his power by entering into an alliance with his brother Antigonus Gonatas; but they quickly became jealous of each other, and Ptolemy availed himself of their dissensions to extend his kingdom.

We possess hardly any particulars respecting the life and character of Ptolemy Euergetes. If inferior to his predecessors, he was superior to these that reigned after him; Strabo says (p. 796) that the kings of Egypt after the third Ptolemy governed worse than their predecessors. He followed his father's example in giving every encouragement to trade and commerce. It appears from an inscription, which was found at Adule by Cosmas [ADULE], that Ptolemy had conquered Abyssinia, and that he maintained a powerful fleet in the Red Sea. A translation of this inscription, with many valuable remarks, is given in Dr. Vincent's 'Commerce and Navigation of the Antients in the Indian Ocean,' vol ii., p. 533, &c. If we can trust to this inscription, Ptolemy Euergetes must in his wars with Seleucus have subdued the greater part of Asia. It states that he had received from his father the kingdom of Egypt, Africa, Syria, Phoenicia, Cyprus, Lycia, Caria, and the Cyclades, and that he invaded Asia with his land and sea forces, and with elephants from the country of the Troglodytes and Ethiopians. The inscription then states that with these forces he reduced all the country on this side the Euphrates, as well as Cilicia, the Hellespont, Thrace, and all the forces in these provinces; and that he afterwards crossed the Euphrates, and entered Mesopotamia, Babylonia, Susiana, Persis, Media, and the whole country as far as Bactria, and brought the whole under his dominion.

During the reign of Euergetes, Cleomenes, king of Sparta, took refuge in Egypt, and was received by him with great distinction. (Plutarch, *Cleom.*, c. 32; Paus., ii. 9, § 3; Justin, xxviii. 4.)

Ptolemy Euergetes married Berenice, the daughter of Magas, king of Cyrene. [BERENICE III.] By her he had three children, Magas, Ptolemy Philopator, and Arsinoe. He was murdered by his own son Philopator, B.C. 222.



Coin of Ptolemaeus Euergetes.
British Museum. Actual Size. Silver.

IV. PTOLEMÆUS, surnamed PHILO'PATOR, or 'father-loving,' succeeded Euergetes, B.C. 222. He was distinguished by his profligacy and cruelty, and is said to have been ironically called Philopator on account of having murdered his father. (Justin, xxix. 1.) His chief minister was Sosibius, at whose instigation he put to death his mother Berenice, his uncle Lysimachus, his brother Magas, his wife and sister Arsinoe, who is called Eurydice by Justin (xxx. 1), and Cleomenes the Spartan king. (Polyb., v. 34, 35; xv. 25; Plutarch, *Cleom.*, 33, 34, &c.) Philopator however appears to have been an able general. In B.C. 219 the province of Cœle-Syria, which had been conquered by his father, was attacked by Antiochus the Great, who at first obtained possession of the greater part of it through the treachery of Theodotus, the Egyptian governor. In the following year however the forces of Ptolemy were more successful. Antiochus was defeated in a great battle fought at Raphia, near Gaza, B.C. 217; and Cœle-Syria and Palestine were ceded to Ptolemy by a treaty made in the same year. (Polyb., iv. 37; v. 79-87.) [ANTIOCHUS III.]

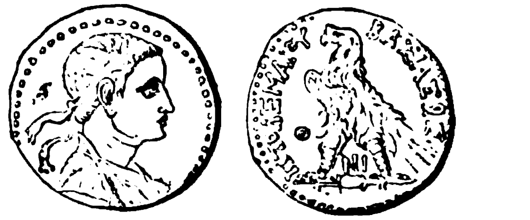
Philopator died B.C. 205, after a reign of seventeen years. (Clinton.)

Coin of Ptolemaeus Philopator.
British Museum. Actual Size. Silver.

V. PTOLEMÆUS, surnamed EPI'PHANES, or 'illustrious,' the son of P. Philopator and Arsinoe, was only five years old at the death of his father. (Justin, xxx. 2.) Antiochus the Great thought it a favourable opportunity not only to recover Cœle-Syria, but also to obtain the sovereignty of Egypt, and accordingly united with Philip, king of Macedon, to divide the Egyptian dominions between them. (Polyb., iii. 2; Liv., xxxi. 14.) The guardians of the young king took the precaution of placing him under the protection of the Romans, which the latter willingly undertook, as they were anxious to obtain a pretext for attacking Philip and Antiochus. (Justin, xxx. 2, 3.) Livy also mentions (xxxi. 9) an Egyptian embassy to Rome in B.C. 200.

When the Romans were engaged in their war with Philip, Antiochus attacked the dominions of Ptolemy, and reduced, in B.C. 198, all the cities in Cœle-Syria. He also conquered Scopas, who had in the preceding year brought 6000 auxiliaries to Ptolemy. (Liv., xxxiii. 19.) But as Antiochus was anxious to prosecute his conquest in Asia Minor, he proposed a treaty of marriage between his daughter and Ptolemy, to be consummated when both came of age, by which Cœle-Syria and Palestine were to be given with the princess as a dowry. (Polyb., xxviii. 17; Joseph., *Ant.*, xii. 4, § 1.) This marriage was afterwards celebrated in the year B.C. 192 or 193, when Ptolemy was about seventeen years of age.

Ptolemy died B.C. 181, and is said to have been poisoned. (Hieron., *Ad Dan.*, c. 11.) He left three children, P. Philometor, P. Physcon, and Cleopatra, who was successively married to her two brothers. (Joseph., *Antiq.*, xii. 4, § 11; Justin, xxxviii. 8.)



Coin of Ptolemaeus Epiphanes.
British Museum. Actual Size. Gold.

VI. PTOLEMÆUS, surnamed PHILOMETOR, or 'mother-loving,' was a child when his father died; but the government was conducted by his mother Cleopatra. During the life-time of Cleopatra, the kingdom of Egypt enjoyed repose; but on her death, her brother Antiochus Epiphanes claimed Cœle-Syria and Palestine, which had been given to Ptolemy Epiphanes as his wife's dower. In B.C. 171 Antiochus invaded Egypt and defeated the army of Philometor at Pelusium; and in the following year he took most of the principal towns in Egypt, with the exception of Alexandria, and obtained possession of the person of Philometor. After the capture of Philometor, the Alexandrines raised his brother to the throne, who took the name of Euergetes II., but is more commonly known by that of Physcon.

In B.C. 169 Antiochus invaded Egypt for the third time, under pretence of restoring the kingdom to Philometor. He laid siege to Alexandria, and would probably have obtained possession of the city, had not ambassadors come from Rome, who commanded him to abandon the attempt. Afraid of provoking a war with the Romans, he retired from Egypt, leaving Philometor nominal king of the whole country with the exception of Alexandria. He appears to have hoped that the quarrels of the brothers would have still further weakened the country and rendered it an easier conquest to him; but they, seeing through his ambitious designs, agreed to divide the royal power between them, and turn their forces against him. Disappointed in his object, Antiochus again invaded Egypt in the following year (B.C. 168), and declared that he would not withdraw his forces unless Cyprus, and the strong city of Pelusium, with the surrounding country, were ceded to him. As the possession of the city of Pelusium would have enabled him at any time to overrun Egypt, his proposals were refused; and he accordingly marched towards Alexandria, but was again met within four miles of the city by the Roman ambassadors, who compelled him to depart from Egypt. (Liv., xlv. 11, 12.)

The two brothers however did not agree; and in the seventh year of their joint reign Philometor was driven from Egypt by Physcon, and obliged to take refuge in Rome. He was treated with great distinction by the senate, who restored him to his kingdom, and limited the dominions of Physcon to Cyrene. (Liv., *Epit.*, 46, 47; Valerius Max., v. 1, § 1.) In the following year Physcon went to Rome to complain of the unequal division of the Egyptian kingdom, and to beg that Cyprus might be given to him. The senate complied with his request, and commanded Philometor to surrender that island to his brother. Philometor however refused to do so; and the Romans accordingly declared war against him, B.C. 159 (Diod. Sic., vol. ii., p. 626, ed. Wesseling), but did not prosecute it with much activity. They did not send any force to the assistance of Physcon, but gave permission to their allies in Greece and Asia to enlist under his standard. (Polyb., xxxi. 5.) In the war which followed between the brothers, the Romans took no part. Physcon was defeated in Cyprus, and fell into the hands of Philometor, who however forgave him, and allowed him to retain the sovereignty of Cyrene. (Polyb. xl. 12; Diod. Exc., vol. ii., p. 586.)

About the year B.C. 151, Ptolemy Philometor marched into Syria to support Alexander Balas (Justin, xxxv. 1), who had been acknowledged king of Syria by the Romans, in opposition to Demetrius, the rightful heir. [ALEXANDER BALAS.] By the assistance of Philometor and the kings of Pergamus and Cappadocia, Alexander obtained possession of the throne, and married, in B.C. 150, Cleopatra, the daughter of Philometor. (1 Macc. x. 57, 58; Joseph., Antiq., xiii. 4, § 1.) Shortly afterwards however Philometor, accusing Alexander of an intention to murder him, took away his daughter, and gave her in marriage to Demetrius II. He then marched into Syria, and was crowned at Antioch as king of Asia and Egypt; but afraid of exciting the jealousy of the Romans, he relinquished Syria to his new son-in-law. During these transactions Alexander was in Cilicia; and as soon as he heard of what had taken place, he marched towards Antioch, near which he was defeated by Ptolemy and Demetrius. Philometor however died a few days afterwards of the wounds which he had received in battle. (1 Macc. xi. 1-18; Joseph., Antiq., xiii. 4, § 5-8; Justin, xxxv. 2.)

The character of Ptolemy Philometor is favourably drawn both by Polybius (xxxix. 7, § 13; xl. 12) and Diodorus (vol. ii., p. 588). He was an active and enterprising prince, and did much during the latter years of his reign to repair the losses which his subjects had sustained by the conquests of Antiochus Epiphanes, and in the wars between himself and his brother. He was mild and merciful, and his conduct in that respect was a striking contrast to that of his father and brother. He died B.C. 146, after a reign of thirty-five years. (Clinton.) He left a son, who was only a child at his death, and two daughters of the name of Cleopatra, of whom one married successively Alexander Balas and Demetrius, as already stated, and the other afterwards reigned in Egypt jointly with her sons.

VII. PTOLEMAEUS, surnamed EUERGETES II., or PHYSCON (big belly), succeeded his brother B.C. 146, and commenced his reign by putting to death his brother's son. (Justin, xxxviii. 8.) Physcon is represented by the ancient writers as a cruel and sensual tyrant. He derived his name of Physcon or Big-Belly, from his unwieldy form; for he was, according to Justin (xxxviii. 8) and Diodorus (vol. ii., p. 597), ugly in face, short in stature, big-bellied, and more like a beast than a man. The portrait which Rosellini gives of Physcon, from the ancient monuments of Egypt, is also that of a fat and sensual man. ("British Museum," Egyptian Antiquities, vol. ii., p. 88, 89.) Posidonius the Stoic also described him (Athen., xii., p. 549) as a fat unwieldy man, who never went out without a stick.

He married Cleopatra, his own sister and his brother's widow, who bore him a son in the second year of his reign, while he was at Memphis for the purpose of being crowned. (Diod., vol. ii., p. 593.) He soon afterwards put away his sister, and married her younger daughter, his own niece, Cleopatra. He practised all kinds of cruelties upon his subjects, till at length Alexandria became almost deserted, and Physcon was obliged to admit strangers to settle there. (Justin, xxxviii. 8.) He possessed an able minister in Hierax (Diod., vol. ii., p. 597), who compensated in some degree for the inactivity of the king, and restrained for a time the discontents of his subjects; but at length the people could bear his cruelty no longer, and in the sixteenth year of his reign compelled him to fly to Cyprus. The government was committed by the people to Cleopatra, his sister and divorced wife. Her son was with his father at Cyprus; and Physcon, fearing lest she might make use of her son's name to strengthen her on the throne, put him to death and sent his hands, feet, and head to Cleopatra, with directions that they should be given her in the midst of an entertainment. (Diod., vol. ii., p. 602, 603; Justin, xxxviii. 8; Liv., Epit., 59; Valer. Max., ix. 2, § 5.) In the war which followed, Physcon again obtained possession of the throne, which he held till his death, B.C. 117.

In the year B.C. 143, Scipio Africanus was sent at the head of a Roman embassy to Egypt, and was received with great pomp and respect by Physcon, who conducted him as far as Memphis. (Diod. Exc., vol. ii., p. 629, 630; Justin, xxxviii. 8.)

Physcon, though a sensualist and a tyrant, was a patron of learning and the fine arts. He was a disciple of Aristarchus, and wrote himself an historical work, which is frequently referred to by Athenaeus (ii., p. 71; xiv., p. 654, &c.). Physcon had by his niece Cleopatra five children; two sons, Ptolemy Soter and Alexander, and three daughters, Tryphaena, Cleopatra, and Selene. He also left an illegitimate son, Ptolemy Apion, who reigned at Cyrene, and bequeathed his kingdom to the Romans at his death in B.C. 96. (Clinton, vol. iii., p. 389.)

VIII. PTOLEMAEUS, surnamed SOTER II., but more frequently called LATHYRUS (Λάθουρος, Strab., p. 796), succeeded his father Euergetes II., B.C. 117. He reigned together with his mother Cleopatra, who wished to have her younger son Alexander for her partner on the throne, but she was obliged by the people to select the elder. (Justin, xxxix. 3.) She always showed the greatest hostility to her eldest son, who is sometimes in consequence called ironically Philometor. (Paus., i. ix. § 1.) During the lifetime of Physcon, Lathyrus was sent to Cyprus; and though compelled to make him king, she did everything in her power to weaken his authority. At the commencement of his reign she compelled him to put away his sister Cleopatra, to whom he was married, and marry his youngest sister Selene. (Justin, xxxix. 3.) She gave the island of Cyprus to her younger son, and after reigning ten years in conjunction with Lathyrus, at length raised an insurrection in Alexandria against him, which compelled him to leave Egypt. She permitted him however to retire to Cyprus, after taking away from him his wife Selene; and she recalled her younger son Alexander to Egypt, and associated him with her in the government, B.C. 107. (Justin, xxxix. 4; Paus., i. 9, § 2.)

Lathyrus subsequently took an active part in the affairs of Palestine. Gaza and some other cities of Palestine requested his assistance against Alexander Jannaeus, and he accordingly landed in Palestine with an army of 30,000 men. (Joseph., Antiq., xiii. 12.) He at first met with considerable success, but Cleopatra, fearing lest her son, after the conquest of Palestine, should march upon Egypt, sent an army to the assistance of Alexander, which compelled Lathyrus to give up the war and retire to Cyprus.

In the year B.C. 89, Cleopatra was put to death, after a reign of 29 years, by her favourite son Alexander, who wished to obtain the sole possession of the crown. The people however rose against him a few months after, and compelled him to flee from Egypt. His brother Lathyrus was then recalled. (Paus., i. 9, § 2, 3; Justin, xxxix. 5.) The city of Thebes however refused to submit to his authority; but it was taken and plundered after a siege of three years. (Paus., i. 9, § 3.) He died B.C. 81, leaving a daughter, Berenice or Cleopatra, and two illegitimate sons, Ptolemy Auletes and Ptolemy who reigned in Cyprus. The latter is mentioned in several of Cicero's orations (Pro Sestio, 26; Pro Domo, 8, 20; Pro Flacco, 13).

There is some difficulty respecting the immediate successor of Lathyrus. It appears that there were two kings of the name of Alexander, who successively reigned between the death of Lathyrus and the accession of Auletes; but as Clemens of Alexandria (Strom., i., p. 335) and Strabo (xvii., p. 796) both mention Auletes as the immediate successor of Lathyrus, the authority of the two Alexanders was probably not acknowledged in all parts of Egypt, or they must at least have reigned for a very short time. The subject is fully discussed by Mr. Clinton (vol. iii., p. 391, 392).

IX. PTOLEMAEUS, surnamed NEOS DIONYSUS, 'the young Dionysus,' but more commonly AULETES, 'the piper,' was an illegitimate son of Lathyrus, and succeeded to the throne B.C. 81. His vices and low habits made him contemptible to his people (Strabo, xvii., p. 796; compare Cic., De Leg. Agrar., ii. 16), who expelled him from Alexandria in B.C. 58. He came to Rome in the same year, and on his way thither met Cato at Rhodes. (Plut., Cat. Min., c. 35.) The Alexandrians placed upon the throne Berenice, the daughter of Auletes, and sent ambassadors to Rome to plead their cause against the king. Auletes however found means to gain over a large party in the senate. Cicero made a speech in his favour, which was afterwards published, but of which only a few fragments have come down to us; and the creditors of Auletes, who were very numerous, used every exertion to obtain his restoration to his kingdom. In the following year B.C. 57 the senate passed a decree for his restoration; but in B.C. 56 there was much dispute respecting the manner in which and the persons by whom he should be restored. In consequence of the opposition which was made against him, nothing was done in that year; and we find that he retired in despair to Ephesus. (Dio., xxxix. 12-16; Cic., *Ep. ad Qu. Fr.*, ii. 2; *Ad Fam.*, i. 1, 2.) Auletes however possessed a powerful friend in Pompey, and in consequence of his support he prevailed upon Gabinius, in B.C. 55, to undertake his restoration. (Dio., xxxix. 55; Strabo, xvii., p. 796; Liv., *Epit.*, 105; Cic., *in Pison.*, 21.)

Berenice, whom the Alexandrians placed upon the throne, first married Seleucus, called Cybiosactes by Strabo, the pretended son of Antiochus Eusebes, and afterwards Archelaus, the son of the Archelaus who had carried on war against Sulla. Auletes, on his restoration in B.C. 55, put to death both Archelaus and his daughter. (Strabo, xvii., p. 796.) Auletes survived his restoration about three years and a half, and died in the beginning of May, B.C. 51. (Clinton, vol. iii., p. 395.) He left two sons, called Ptolemy, and two daughters, Cleopatra and Arsinoe. The history of his two sons is given under CLEOPATRA.

PTOLEMÆUS, CLAU'DIUS, a native of Egypt, but the place of his birth is not ascertained: the surname of Pelusiota, which is given to him in some editions of his works, appears to be a mistake of the copyists or translators. He lived at Alexandria in the first half of the second century of our æra, under the reigns of Hadrian and Antoninus Pius. Nothing more is known of his life, except his works. He was an astronomer, chronologist, and geographer. Ptolemy's Geography was for many centuries the text-book in that science for all the schools, and was superseded only in the fifteenth century, in consequence of new information derived from the discoveries of the Venetian, Portuguese, and other travellers and navigators.

Ptolemy and Strabo followed a different method in their respective works. Strabo's work is a descriptive geography; Ptolemy's is a mathematical geography. Strabo wrote mainly for the instruction of persons engaged in administration: he describes the physical character of each country, its extent, and its political divisions; he gives some historical account of the various peoples that had inhabited it; and he then proceeds to notice the subdivisions, the mountains, valleys, rivers, and towns, with their respective distances from each other, and the objects worthy of remark in them. He makes us acquainted with each place in a manner resembling that of modern books of travels, or guide-books. Ptolemy on the other hand applies himself to fix the astronomical position of each place; he gives a bare list of names of mountains, rivers, and towns, with their respective longitude and latitude, without any description, or at least only a few words. Strabo endeavours to ascertain the forms of the large masses of land and of the seas by a combination of itinerary distances between various points, referring only to a few positions which had been ascertained by actual observation: Ptolemy fixes the position of each place as if it were ascertained by astronomical observation. Ptolemy availed himself of the labours of Eratosthenes, Hipparchus, and the other mathematicians of the Alexandrian school [HIPPARCHUS]; but by adopting the method of Hipparchus in the projection of the map, in order to assimilate it to the spheroidal form of the earth, he committed a material error in his longitudes, all of which he places too far to the east. Beginning from Calpe, he places it 5° east of the Sacrum Promontorium of Iberia or Spain, an error of 1° 50′, and goes on increasing the excess of longitude as he advances to the eastward, making the length of the Mediterranean twenty degrees more than it is. He proceeds through Asia in the same way, till he places the mouths of the Ganges above forty-six degrees more to the eastward than the true position. Gosselin, at the end of his 'Géographie des Grecs analysée,' gives tables which show the difference between Ptolemy's positions and the true ones. Gosselin supposes that Ptolemy was led into this material error by estimating the degree of longitude at 500 stadia at the equator, and at 400 stadia in the parallel of Rhodes; while Eratosthenes had reckoned the first at 700 stadia, and the second at 555. But Ptolemy retained Eratosthenes's measure of 700 stadia for a degree of latitude, because he found that if he were to reckon the degree of latitude at 500, all his latitudes, several of which had been fixed by observation, would be too high; and that Alexandria, for instance, instead of being in 31°, would be in 43°, and Marseille in 60°. The different value given to the stadium by different geographers was a cause of much confusion. 'Eratosthenes,' says Gosselin, 'had fixed the distance between the Sacrum Promontorium of Spain and the eastern mouth of the Ganges at 70,000 stadia. These 70,000 stadia being reduced into degrees of 700 stadia each, give 100 degrees for the whole longitudinal distance, which is not far from the truth. But Ptolemy, by taking his degree of longitude too small, made 146 degrees between the two points. But again, if we reduce these 146 degrees at the rate of 500 stadia each, we shall have about 73,000 stadia.' See also on this subject both Mannert and Ukert, in their respective works, both entitled 'Geographie der Griechen und Römer.'

Dr. Brehmer, in his 'Entdeckungen im Alterthum,' 1822, pretends that Ptolemy consulted some Phœnician charts, and he lays great stress upon the geographical knowledge of the antient Phœnicians. Gosselin however, as well as Heeren (*Commentatio de Fontibus Geographicorum Ptolemæi, Tabularumque iis annexarum*, Göttingen, 1827), reject Brehmer's hypothesis: they reduce within very moderate dimensions the supposed geographical and astronomical knowledge of the Phœnicians, and trace the sources of Ptolemy's peculiar information to other quarters, and especially to the discoveries and conquests made by Roman commanders between the time of Augustus and the age of the Antonines, to the long peace which subsisted between the Romans and the Parthians under Hadrian and Antoninus Pius, and the flourishing commerce which was carried on during that period between the Roman empire and the remotest parts of India. Marinus of Tyre, who lived about the year 100 of our æra, had written a geography and constructed maps of which Ptolemy availed himself.

Ptolemy begins by stating in his first book the object of his work, and explains the elements of mathematical geography. He then, after mentioning with praise his predecessor Marinus of Tyre, notices, in chapters vi. to xviii., the errors into which that geographer had fallen, and corrects them. Marinus had read the geographical works and itineraries of most of those who had preceded him, and had constructed maps which he repeatedly corrected in successive editions; but Ptolemy, as he says, still found much to correct in the work of Marinus. Ptolemy mentions several travellers from whose itineraries Marinus had derived much of his information, such as a certain Diogenes who navigated the Indian seas; Dioscorus and Theophilus, who frequented the harbour of Azania, on the eastern coast of Africa: Alexander, a Macedonian, who had sailed from the Chersonesus Aurea to Cattigara; Philemon, who had visited Hibernia; and a certain Titianus, called Maës, whose agents used to trade as far as Serica, the modern Tibet or Chinese Tartary; but he adds (chap. 17) that some of the information collected by Marinus had been superseded by the testimony of more recent travellers and navigators, whom he, Ptolemy, had consulted, especially with regard to the remote regions of India. In the last three chapters of the first book, Ptolemy describes the method of drawing maps adapted to represent the spherical form of the globe.

With book ii. begins the description of the known world, which in the time of Ptolemy extended, from west to east, from the Fortunate or Canary Islands, where Ptolemy places his first meridian, to the vaguely defined regions of Serica and Sinæ, near the western and south-western borders of China, somewhere between 100° and 105° east of London, embracing altogether about 120 degrees of longitude, or one-third of the actual circumference of the globe, which extent however, through Ptolemy's error already noticed, was magnified by him to 180 degrees, or a full hemisphere. To the northward Ptolemy's known world extended to the sixty-third parallel of north latitude, in which he places the island of Thule north of Caledonia, near the site of the Shetland Islands. Some think that the Thule of Ptolemy was Norway. To the south, Ptolemy's known world extends nearly to the equator, but he places his latitudes about ten degrees too far south. He places the sources of the true Nile, or Abiad, in about 7° S. lat., and the emporium of Rhapta, on the eastern coast of Africa, and that of Cattigara, on the coast of the Sinæ, in about 8°. By comparing Ptolemy's world with that of Strabo, it may be seen how much the limits of the known world were extended during the century and a quarter which elapsed from the time of Augustus and Tiberius to that of the Antonines. Strabo's information did not extend northwards beyond the Elbe; of Britain he knew little, and of Hibernia nothing; to the eastward it only extended as far as Taprobana (Ceylon) and the mouth of the Ganges. Ptolemy added information, though it was vague, of India beyond the Ganges, the Chersonesus Aurea, and the countries of Serica and Sinæ east of the Chersonesus Aurea. Strabo had made the Hyrcanian or Caspian Sea a gulf of the Northern Ocean, though Herodotus (i., c. 203) had described it as a lake. Ptolemy also describes it as a lake, retaining however the error of his predecessors as to making its length from east to west, instead of from north to south. This mistake originated probably in some confused notion of the existence of the Aral Lake east of the Caspian. In one respect however Ptolemy's information was more remote from truth than that of Strabo, for he made the Indian Sea a gulf, without any communication with the Atlantic, and he supposed that the south-eastern coast of Africa turned to the east and joined that of Asia. This authority perpetuated for a long time the error of supposing that Africa could not be circumnavigated by the south. This error is the more curious, as there was an old tradition, preserved by Herodotus, of the circumnavigation of Africa. [AFRICA.] With regard to the interior of Africa, Ptolemy's information extended considerably further than that of his predecessors. [NIGER.]

Ptolemy proceeds in his description of the world from west to east. He begins with Hibernia, and Albion or Britain, stating the bearing of the great lines of coast, noticing the gulfs, estuaries of rivers and capes, with the longitude and latitude of each, and he mentions the names of the various tribes and towns in succession, first those along the coasts, and afterwards those in the interior. His latitudes in Britain and Ireland are all too high by several degrees. He next describes Iberia, or Spain, with its divisions into provinces, stating the boundaries of each, and then, following the coast, he names the various towns, rivers, gulfs, and capes, fixing their respective positions. Few other particulars are given. We subjoin a specimen of the manner of his description:—'Iberia contains three provinces, Bætica, Lusitania, and Tarraconensis. The side of Bætica which looks to the west and north, is bounded partly by Lusitania and partly by the Tarraconensis province, and the description of this part is as follows:—

	Long.	Lat.
'The eastern mouth of the river Anas in	4½	37¼
Bend of the river to the eastward	6¼	38
The part of the river nearest to Lusitania	9	39
And the boundary line between Bætica and Tarraconensis reaches the coast of the Balearic Sea in	12	37½
The sources of the Anas are in	14	40

'The southern boundary of Bætica is formed by the external ocean and the Straits of Hercules, and to the eastward by the Iberian Sea, and the description of this part is as follows, beginning from the estuary of the Anas, in the external ocean:—

Country of the Turdetani.

	Long.	Lat.
Onoba Æstuaria	4⅚	37¼
Mouth of the Bætis	5	37
Sources of the river	12	38¼
Æstuary near Asta	6	36⅔

Country of the Turduli.

	Long.	Lat.
Menesthei portus	6	36½
Promontory at the entrance of the straits, on which is the temple of Juno	5½	36⅙
Mouth of the river Belon	6¼	36¼
Belon town	6½	36¼

Bastuli called Pœni.

	Long.	Lat.
Menralia	6⅔	36¼
Transductamensis	6⅚	36⅙
Barbesola	7¼	36½
Carteia	7½	36¼
Mount Calpe and pillar	7½	36¼'

Ptolemy goes on describing after this manner the whole of Spain, and afterwards Celto-Galatia, or Gaul, and then Germany. Ptolemy notices the Chersonesus Cimbrica and the southern part of the Baltic as far eastward as the river Chesinus, the modern Düna. But Ptolemy does not seem to have known that the Baltic was an inland sea. East of the Chersonesus Cimbrica he places four islands, under the name of Scandiæ Islands. Scandinavia in his time was supposed to be an island. After Germany he describes Rhætia, Vindelicia, Noricum, Pannonia Upper and Lower, and Illyris, or Liburnia.

Book iii. contains a description of the eastern part of Europe, including Italy, with Sicily, Cyrnus or Corsica, Sardinia, European Sarmatia, Chersonesus Taurica, the country of the Iazyges Metanastæ, Dacia, Mœsia Upper and Lower, Thracia, with the Chersonesus, Macedonia, Epirus, Achaia, the Peloponnesus, Eubœa, and Creta.

Book iv. contains the description of Libya (Africa), namely, the two Mauritaniæ, Numidia, Africa Propria, Cyrenaica, Marmarica, Egypt, Libya, Æthiopia south of Egypt, the island of Meroe, and Interior Æthiopia. Book v. relates to Western or Lesser Asia, with the Greater Armenia, Colchis, Iberia, Albania, Arabia (Petræa and Deserta), Syria and Palestine, Mesopotamia, Babylonia, and the island of Cyprus. Book vi. treats of Asia Major, including Assyria, Susiana, Media, Persis, Parthia, Hyrcania, Carmania, Arabia Felix, Margiana, Bactriana, Sogdiana, Aria, Paropamisus, Drangiana, Arachosia, Gedrosia, the country of the Sacæ, Scythia within and without Mount Imaus, and Serica, the metropolis of which is placed by Ptolemy in 38⅗° N. lat., and 177¼° E. long., but which seems to have been somewhere near the actual western borders of China, or the eastern part of Tibet.

Book vii. contains India within the Ganges, Taprobana, India without the Ganges, with the Chersonesus Aurea, and farther still the country of the Sinæ, which Ptolemy describes as bounded on the north by Serica and on the east and south by 'unknown lands,' and on the west partly by India beyond the Ganges, and partly by a great gulf of the sea, which separates it from the Chersonesus Aurea, which forms the southern extremity of India beyond the Ganges. This position seems to indicate the countries of Siam and Cambodia, and the great gulf as the Gulf of Siam. Ptolemy then mentions another gulf farther to the east as the Gulf of Sinæ, perhaps from a confused notion of the sea of Cochin-china and Tonkin. Cattigara, a mercantile station on the coast of Sinæ, which he places in 8½° S. lat., has been looked for by some on the coast of Borneo. Gosselin however thinks that the great gulf is the Gulf of Martaban, that Cattigara is Mergui, and Thinæ the capital of the Sinæ, Tenasserim, and that the Sinæ of Ptolemy is the country of Siam, and that Ptolemy's information did not extend as far as the eastern coast of the peninsula of Malacca. The length of that peninsula, and its apparent continuation by the coast of Sumatra, gave rise to the notion of a continuous land enclosing the Indian Ocean on the east and south, and joining the eastern coast of Africa. (See Ptolemy's ch. 14 of book i. on the 'Navigation from the Chersonesus Aurea to Cattigara.')

The enormous size given to Taprobana (Ceylon) by Ptolemy and other antient geographers probably originated in their mistaking the peninsula of India for an island.

A good view of Ptolemy's known world, reduced to its real extent and position, is given by Gosselin in a map at the end of the fourth volume of his 'Recherches sur la Géographie systématique et positive des Anciens, pour servir de Base à l'Histoire de la Géographie ancienne,' 4 vols. 4to., Paris, 1813. The map is inscribed, 'Orbis Veteribus noti vera Limitibus circumscripti Specimen Geographicum.'

The latter part of book vii. and book viii. are a recapitulation of his system, with a description of the maps, twenty-six in number, which accompanied the work, namely, ten for Europe, four for Africa, and twelve for Asia. [AGATHODÆMON.]

Several editions of Ptolemy's Geography, translated into Latin, appeared in the fifteenth century. Among the best are those of Rome, 1478 and 1490. The Greek text was first printed at Basle in 1533, under the care of Erasmus. Servetus published a Latin edition at Lyon in 1541. Petrus Bertius published the work in Greek and Latin, Amsterdam, 1619. The Abbé Halma published at Paris, 1828, the first book of Ptolemy in the Greek text with a French translation accompanied by a Memoir 'On the Measures of the Antients.' Sickler published in 1833, at Hesse Cassel, Ptolemy's description of Germany, from an old Greek MS. in the king's library at Paris, as a specimen of an intended correct edition of the whole work, which he proposed to publish by subscription: 'Claudii Ptolemæi Germania, è Codice MSpto. Græco antiquissimo nondum collato, qui Lutetiæ Parisiorum in Bibliotheca Manuscriptorum Regia sub titulo Cod. Reg. Fontablandensis, No. 1401, asservatur, accurate descripta; edidit Dr. F. C. L. Sickler of Hildburghausen.' There are in the royal library at Paris ten MSS. of Ptolemy. It is well known that all the old editions of Ptolemy, both Greek and Latin, are incorrect, and that numerous errors were introduced into the text by ignorant transcribers and translators, especially during the fourteenth century. It appears also that as new discoveries took place, people took upon themselves to interpolate and correct Ptolemy's text without much discrimination. (*Commentatio critico-litteraria de Claudii Ptolemæi Geographia, ejusque codicibus, tam manuscriptis quam typis expressis, conscripta*, à G. M. Raidelio, Norimbergæ, 1737.)

There is in the Imperial library at Vienna a fine MS. copy on parchment of Ptolemy's geography in Greek, with twenty-seven maps, which are stated at the end to have been constructed by Agathodæmon of Alexandria. This statement is found also in another MS. in the library of St. Mark at Venice, as well as in others, and Raidelius read the same assertion in a fragment of an old MS. of the eleventh century. The maps which accompany the edition of Rome, 1478, and that of Ulm, 1482, appear to have been copied from the MS. maps. (Heeren, *De Fontibus*, &c.)

PTOLEMÆUS, son of Juba. [Mauritania.]

PTOLEMAIC SYSTEM. A few words of general explanation constitute all that can be given under this head, and we are not now speaking with particular reference to Ptolemy, of whose part in the matter we treat more particularly under Syntaxis, but of the astronomical part of that system which, founded on early metaphysical and physical doctrines adopted by Plato and Aristotle, reinforced by mathematical hypotheses drawn from Hipparchus and Ptolemy, received by the Mohammedans and by them imparted to the Christians of the middle ages, was the doctrine universally established in Europe till the seventeenth century. As a whole it combines the physics of the Aristotelian school, the geometry of Euclid and his successors, the sexagesimal arithmetic of the Greeks, and the astronomy of Hipparchus and Ptolemy, with some slight additions from later names. The geometry remains, the arithmetic has been supplanted by the decimal system of the Hindus; the physics and astronomy stood and fell together; and as under the words Ptolemaic System the astronomy is particularly meant, we only here notice the physical notions so far as they are connected with it.

The early separation of perceptible matter into the four elements of earth, water, air, and fire, with observation of the relative places they appear to assume, led to the formation of an elementary system. Earth (and solids generally) sink in water, while air rises in water, and flame in air. Hence the notion that the mass of the earth is the central body of the universe; above is a region of water, through which rises that portion of earth on which men and animals live. Above this is a region of air, and above this again a region of fire. Nothing is at rest until it arrives at its proper or natural place, and all the motions of a part separated from its whole are rectilinear; fire rises, and bodies fall, in straight lines. Gravity and levity are only the efforts of bodies separated from their natural places to return to them.

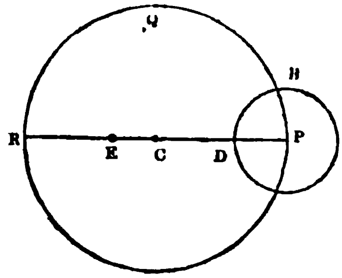
Above the earth and the elementary zones which encompass it, are other successive zones, called heavens. Each heaven contains an immense crystal spherical surface, to which one of the heavenly luminaries is attached, or would be attached, if it moved uniformly in a circle, as it would then do if the crystal sphere were made to revolve uniformly. But the varied motions of the heavenly bodies made it necessary that smaller orbs should be placed with their centres upon the larger ones, as hereafter noticed, and that the planets should move with the smaller ones. It is hardly to be believed (at least so many think) that Ptolemy and the mathematicians received these orbs, in the physical sense, or as anything but hypotheses for representing the actual motions of the planets; it is certain however that the actual solid orbs continued to be received till a late period; and even in the final scholium of the Principia, Newton thinks it worth while once more to overturn them, as Tycho Brahé had done before him, by showing that if they existed, the comets could not move as they were known to move.

The first heaven is that of the moon; the second that of Mercury; the third that of Venus; the fourth that of the Sun; the fifth that of Mars; the sixth that of Jupiter; the seventh that of Saturn; the eighth that of all the fixed stars. The heavens of Aristotle end here; later theorists add two more, a ninth, to make the precession of the equinoxes, and a tenth, or primum mobile, to make the diurnal revolution. All beyond this is the empyreal heaven.

The office of the *primum mobile* is to revolve from east to west in twenty-four hours, carrying with it (but how, we do not know) the whole of the subordinate heavens, and making all the phenomena of day and night. All the heavenly motions are to be circular and uniform; this doctrine of the Platonic school is the keystone of the whole system. The poles of the primum mobile are those of the equator; but the ninth heaven moves slowly round the poles of the ecliptic, carrying the whole system forward in longitude, so as to give the phenomena arising from the precession of the equinoxes. The heavens of the other heavenly bodies move round with the mean motions of the bodies depending upon them; and this completes the general view of the system.

The details of the heavenly motions were for the mathematicians only, who dropped the orbs, and only took such circles out of them as were necessary in the explanation of the motions.

Without entering into all the details connected with this explanation, which are rather complicated, and require besides some knowledge of the actual inequalities of the planetary motions, we shall take the two leading circumstances of those motions, namely, their not being uniform, and their being sometimes direct, or according to the order of the signs of the zodiac, and sometimes retrograde. One way of explaining the simple irregularity of motion was by



supposing the orb of the planet to be a sphere, and revolving uniformly, but not concentric with the earth. Let the earth be at E, and let the circle PQR revolve uniformly round the centre C, or let the planet P revolve uniformly in that circle. Consequently, the nearer the planet is to E, the faster it will appear to move, and the contrary, that is, a spectator at E will see the planet moving most slowly when at P, from whence the apparent motion will be accelerated until it arrives at R, and retarded while it returns to P on the other side. The circle PQR is called an eccentric. This hypothesis was a tolerably good representation of the motion of the sun, when EC was taken in a certain specified proportion to the radius CR; and if the sun had been placed at E, it would have made a sufficient representation of the motions of the planets, at least for the earlier periods of observation. But it must be remembered that though an acceleration and retardation would thus be established, it would not be precisely that of the planets, though sufficiently near, as remarked, to represent the results of rough observation.

The mode of obtaining the alternate progressive and retrograde motion is as follows:—Let P be the centre of a circle called an epicycle, and let P revolve uniformly round the earth at C, while the epicycle revolves uniformly round its centre, carrying the planet on its circumference, or while the planet revolves uniformly round the epicycle. Let the epicycle itself move in the direction PQR, and let the planet on the epicycle move in the same direction, or ABD. If then the times of revolution of the planet in the epicycle be sufficiently great compared with that of the epicycle itself, its retrogradation at D will more than compensate for the progression of the epicycle itself; that is, the planet will appear to a spectator at C to move in a retrograde direction, when it is in the lower part of the epicycle. But in the higher part, at A, both motions conspire to make it appear to move directly. There must consequently be an intermediate point at which the direct motion ceases and the retrograde begins; and near this point the planet will appear stationary.

It is by a complicated use of these methods that Ptolemy succeeds in giving a tolerable account of the angular motions known in his time; but they fail in placing the planet at the right distance from the earth, though they may place it nearly in the right longitude. We imagine that in modern times very few persons have taken the trouble to make themselves acquainted with the details of this system

These may be learnt, with some trouble, from Delambre's account of the Syntaxis (*Hist. Astron. Anc.*), but they are explained with much more clearness in Mr. Narrien's 'Origin and Progress of Astronomy,' London, 1833. Those who would have Ptolemy's own explanation at a less expense of time than is necessary to find it in the Syntaxis, should look at his short tract, *Ὑποθέσεις τῶν πλανωμένων*, which was published with the *Sphæra* of Proclus, by Dr. Bainbridge, in 1620. The physical views may be collected, as well as the mathematical ones, from the 'Philolaus,' the first work of Bouillaud, Amsterdam, 1639. [See also Syntaxis; Trochoidal Curves.]

PTOSIS is a dropping of the upper eyelid, which the patient cannot by any voluntary exertion raise from before the globe of the eye. In some cases this effect is produced by great inflammatory swelling of the eyelid with effusion of serum into its tissue; but in those cases to which the name of ptosis is more especially applied, it results from a paralysis of the third pair of nerves [Brain], or only of that branch of it which supplies the levator palpebræ muscle. [Eye.] These are in fact cases of local paralysis, and must be treated, without any particular reference to the eye, according to the principles on which paralytic affections in general are managed. [Paralysis.]

PTYCHOGENS are those Endogenous plants whose leaves are traversed by veins running side by side from the base to the apex, without irregular division, as in grasses, lilies, &c. The name has been given in contradistinction to Dictyogens, which are those Endogens that, like Smilax, have the reticulated veins of Exogens. [Smilaceæ.]

PTYCHOPLEURES, the name used by MM. Duméril and Bibron to designate a subfamily of the *Chalcidians* or *Cyclosaures*, the seventh family of Saurians according to their arrangement. The other subfamily of the Chalcidians is named by them the *Glyptodermes*.

The *Ptychopleures* have the body covered with true scales, which are little or not at all imbricated, and distributed regularly in rings around the body, which is thus as it were circled. Most frequently there is a depression or furrow (sillon) throughout the length of the trunk, and which separates the sides of the abdominal region.

Only one genus is entirely without feet, and that (*Ophisaurus*) would be a true serpent if it had not eyelids, an auditory conduit, soldered jaws, and a tongue not sheathed. [Ophisaurus.]

Pseudopus comes next, inasmuch as it has the rudiments only, or the indications, so to speak, of the existence of a pair of feet (posterior), with the longitudinal lateral furrow and the auditory aperture of the preceding genus. [Sheltopusik.]

All the other genera of the same group have two pairs of feet, or at least the rudiments of them, in which last case are the genera *Chalcides* and *Chamæsaura*. [Chalcides.]

The anterior appendages of the former corresponding to the anterior feet terminate by three or four scaly tubercles, whilst the posterior pair is often only represented by two slender stylets. Here there is neither trace of an auditory canal nor of femoral pores, and the lateral furrow is very little marked.

Chamæsaura has four appendages in lieu of feet, but they are not divided into toes at their extremity. The ear is apparent externally, and there are no folds along the lateral parts of the body.

Then come the species and consequently the genera which have the four feet terminated by toes well separated from each other. They may be divided into those which have only four toes and those which have five distinct toes.

Saurophis is the only genus with four toes only on the anterior and posterior feet. Their auditory canal or its tympanum is visible, as well as the longitudinal fold, and even the femoral pores. Among the genera with five toes on all the feet, and which thereby form an artificial division approximating to the true Lizards, there is one, *Heterodactylus*, which has been so named because the fifth toe of its anterior feet is so short that there was a belief that it did not exist: this genus moreover has neither tympanum nor abdominal furrow. The greater part have besides femoral pores, except the genus *Gerrhonotus*, whose tympanum is distinct and sunk in a canal, and in which the abdominal furrow is very apparent.

The other genera have femoral pores, but two are without that lateral fold which is found in the greater number of the species of this family. These are the genera *Ecpleopus* and *Pantodactylus*.

Among the other genera, there is one, *Gerrhosaurus*, the species of which have not strongly-spined scales round the tail, but they have an auditory aperture, a lateral furrow, and femoral pores. At first view they resemble the Lizards.

The two other genera have round their tails verticillations of rude solid scales, *Zonurus* or *Cordylus* and *Tribolonotus* which differ from each other by the papillæ with which their tongue is covered. They are in filaments and hairy in the first, whilst they are scales in the second, which besides wants the lateral folds and has the back beset with strong spines, which seem to be adherent to the vertebræ.

The genera *Heterodactylus* and *Chalcides*, besides wanting the trace of external ears, have the eyelids very much attenuated. Their tongue, particularly that of *Chalcides*, very much resembles that of the *Amphisbænæ*, and they may be considered as almost insensibly leading the way to the *Glyptodermes*, to which we now draw the reader's attention.

MM. Duméril and Bibron characterise the *Glyptodermes* which correspond to the group of the *Amphisbænæ* by the quadrilled impressions observable all over their skin, which is besides annulated or marked with verticillations, with the trace of the lateral furrow (sillon). They allow the subfamily to contain only three principal genera, although they observe that authors have established a much greater number. They state that these genera are easily distinguished; first, because one only, *Chirotes*, is furnished with a pair of feet (anterior) the fingers of which are sufficiently distinct. In other respects it resembles the *Amphisbænæ*.

The other two genera have no feet, and have been generally arranged among the serpents. One of the most remarkable characters which distinguishes them however is the existence of the pores which are to be seen in front of the orifice of the cloaca in the *Amphisbænæ*, whilst there is not the slightest trace of it in the *Lepidosternon*, which has, as its name indicates, great scaly plates upon the lower and anterior part of the trunk near the neck.

The *Glyptodermes* are, further on in the work of MM. Duméril and Bibron, divided into *Acrodont Glyptodermes* and *Pleurodont Glyptodermes*.

The first section consists but of one genus, *Trogonophis*, Kaup.

The second comprises the genera *Chirotes* [Chirotes], *Amphisbæna* [Amphisbæna], and *Lepidosternon*. (*Erpétologie Générale*.)

PTYCHOTIS, a small genus of Umbelliferous plants, of which the seeds of some of the species have formed articles of condiment and of medicine from very early times. The genus extends from the south of Europe, through the Oriental region, to all parts of India. The calyx is 5-toothed. Petals obovate, bifid, or emarginate, with a long inflexed point. Fruit compressed laterally, ovate or oblong. Seed roundish, or flat before and convex posteriorly. The species are annual or biennial plants. Stem leaves usually cut into numerous capillary segments. Flowers white, disposed in compound umbels, of which the involucels are many-leaved, and the involucre either wanting or few-leaved.

The European species are not remarkable for any useful properties, but *P. coptica* and *P. Ajowan* probably yielded the seeds which formed the *Ammi* of the antients. Botanists and inquirers into the plants, condiments, and medicines of the antients, have usually sought too exclusively in Europe for what was frequently derived from the East. Dioscorides states that the Æthiopic Ammi is called Cumin by some, and that it is thought to be distinct from the royal kind. The seeds of one kind were sent by Forskål to Linnæus, who named the plant Ammi copticum. This has now been removed to the present genus Ptychotis. Arabian authors give Nankhwah as the synonym of Ammi, and Persian authors consider Ajwain to be a synonym of the former. It is remarkable, according to Dr. Royle, that there is also an Indian plant which is everywhere called Ajwain, and celebrated for its aromatic smell, pungent taste, and for its employment both by natives and Europeans for culinary and medicinal purposes; so much so, that Dr. Roxburgh could not conceive that 'this famous Indian plant should be unknown to European botanists.' Dr. Royle says, "in Persian works in use in India the Arabic Nankhwah is given as a synonym of the Indian Ajwain, as it is also of the Greek Ammi.'

The Indian species has been referred by De Candolle to the genus Ptychotis, and called by him P. Ajowan, stating that it was very closely allied to *P. coptica*, which we have seen was considered to be one kind of Ammi—the two kinds described by Dioscorides being Cuminum Æthiopicum and regium. The latter name is translated by the Persians *Kumoon Mullooke*, or royal Cumin, and given as a synonym of the Nankhwah. The Indian and Egyptian kinds of Ptychotis, as ascertained by modern botanists, are therefore most probably the two kinds of Ammi of Dioscorides. These afford interesting instances of the results to be obtained by closely examining the products of nature possessed of any remarkable properties, in the countries where they are produced, and continue to be used, and whence they were probably first obtained by the antients.

PTYCHOZO'ON. [GECKO, vol. xi., p. 105.]

PTYODA'CTYLUS. [GECKO, vol. xi., p. 105.]

PUBERTY (*Pubertas*), the age at which the period of boyhood or girlhood ends, and that of adolescence begins. [AGE.] The word is derived from *pubes*, which in its primary signification means the down or soft hair that generally begins to grow on young people about that time. Puberty appears at various ages, according to the climate, the circumstances connected with education, and the constitution of the individual. The usual period in this country is from the twelfth to the fourteenth year for females, and from the fourteenth to the sixteenth for males. In the northern parts of the island it is often a year or two later in both sexes. It is often observed earlier in boarding-schools both in respect of males and females. In the latter (in London or its vicinity) I have, says Dr. Copland (*Dict. of Pract. Med.*, art. 'Age') not unfrequently met with instances of puberty at ten and eleven years, especially in sanguine and plethoric constitutions; and where the apartments, particularly those for sleeping, have been crowded and close. Women in all countries reach the period of puberty one or two years before men; and the inhabitants of warm before those of cold climates. In the hottest regions of Africa, Asia, and America, girls arrive at puberty at ten, or even at nine years of age; in France not till thirteen, fourteen, or fifteen; whilst in Sweden, Russia, and Denmark this period is not attained till from two to three years later.

Occasionally however an extraordinary precocity exhibits itself in the development of sexual organization and power both in males and females. It is not necessary to dwell at any great length upon instances of exemplification, which may be traced in great numbers in the writings of physiologists who have been curious upon this subject. Those who are desirous of doing so may turn to the 'Journal des Sçavans' for 1689, and the 'Philosophical Transactions' for 1745. In the former Boisset gives an instance of this precocity in a boy of three years old; in the latter, the subject in the case recorded was two years and eleven months. A similar example at a similar age is well known, says Dr. Good (*Pract. of Med.*, 'Præcotia Masculina'), to have occurred only a few years since in a boy who was exhibited by his friends for money to medical practitioners in London; and may be found, together with various others, minutely described in the first volume of the 'Medico-Chirurgical Transactions.' Two, of late date, are also detailed in the eleventh and twelfth volumes of the same work, by Dr. Breschet and Mr. J. F. South. In the year 1741, Mr. Dawkes, a surgeon at St. Ives near Huntingdon, published a small tract, called 'Prodigium Willinghamense,' or an account of a surprising boy, who was buried at Willingham, near Cambridge, upon whom he wrote the following epitaph:—'Stop, traveller, and wondering know, here buried lie the remains of Thomas, son of Thomas and Margaret Hall, who, not one year old, had the signs of manhood; not three, was almost four feet high; endued with uncommon strength, a just proportion of parts, and a stupendous voice; before six he died; as it were, of an advanced age. He was born at this village, October 31, 1741, and in the same departed this life, September 3, 1747.' (See also 'Philos. Trans.,' 1744-5.) As Dr. Elliotson has observed (Blumenbach's *Physiology*, 4th ed., p. 535, note), this perfectly authentic case removes all doubts respecting the boy at Salamis, mentioned by Pliny (*Hist. Nat.*, lib. vii., cap. 17), as being four feet high, and as having reached puberty when only three years old; and respecting the person seen by Craterus, the brother of king Antigonus, who, within seven years, was an infant, a youth, an adult, a father, an old man, and a corpse. (Phlegon, *De Mirab.*, cap. 32.)

Females also may acquire a similar precocity to that of males; and we have numerous and well authenticated instances of pregnancy itself occuring at the early age of nine years. (See references in Dr. Good's *Pract. of Med.*)

At the time of puberty in the male, the larynx enlarges, the quality of the voice is changed, the beard grows, the chest and shoulders enlarge, and the power of procreation commences. In the female, the breasts and pelvis enlarge, the uterine organs are developed, and a peculiar periodic discharge from the uterus commences, which continues, subject to certain suspensions during pregnancy and lactation, as long as the organ is capable of impregnation, or, on the average, about thirty years. The period which commences with puberty is, both as regards the mind and the body, one of the most important epochs of human existence; for, says Dr. Copland (*loc. cit.*), during it the natural development of the sexual organs imparts a health and tonic excitement throughout the economy, bringing to their state of full perfection all the organs of the body, and all the manifestations of mind, excepting those that are derived from experience. The organs of respiration and voice have acquired their full growth and tone, the muscles their due proportion, and the cerebro-spinal nervous system its beautiful organization; placing man, by the exercise of its admirable functions, at the head of all animated creation—the dread of all other animals, the wonder of himself. It is chiefly during this period of life that the mind becomes stored with ideas, derived both from the learning of the antients, the science of the moderns, and the arts and accomplishments of highly civilised life; and is more particularly and more ardently engaged in decomposing the information thus acquired, and recombining it in new and useful and attractive forms.

PUBLICA'NI. The publicani were a body of persons in the Roman state who farmed the public revenues (vectigalia), from which circumstance apparently their name is derived. ('Publicani autem dicuntur qui publica vectigalia habent conducta,' *Dig.*, 39, tit. 4, s. 12.) They were numerous as early as the sixth century of the republic, and they continued to exist under the emperors. The publicani formed various societies or partnerships, which had a corporate character. The persons who were members of these societies were chiefly of the equestrian order, and the whole body was so numerous and wealthy as almost to constitute a separate class in the state. Each societas had a magister, or chief manager, at Rome, and a deputy magister (promagistro), with numerous associates and assistants, in the provinces. [PROVINCIA.] The revenues, which were chiefly leased to the publicani, were tolls, harbour duties, and the scriptura, or the tax that was paid for the use of the public pasture-lands. The publicani had their under-lessees (portitores, τελῶναι, *Luke*, v. 27, 29) and collectors. Numerous slaves were also employed by them in collecting the taxes; and this body of men was comprehended under the term of a 'familia publicanorum.' In the prætor's edict however (*Dig.*, 39, tit. 4, s. 1), which was specially directed against wrongful acts of the publicani, the term 'familia' was interpreted as comprehending all who aided them in collecting the vectigal, whether slaves of their own, of other people, or free men. In our translation of the New Testament these inferior officers are called 'publicans,' and are mentioned together with 'sinners,' a distinction to which they might be partly entitled for their occasional oppressive conduct, and partly to the general dislike of all the world to tax-collectors. It appears that Matthew, who was a Jew, was a publican (*Matth.*, ix. 9), from which circumstance, and from all reasonable probability, it may be concluded that natives of a province were employed as collectors, and probably farmed the revenues of small districts from the great Roman publicani. Indeed it is not easy to conceive how the services of natives could have been well dispensed with.

The publicani undertook to pay fixed sums for the taxes of a particular district or place. The contract was often made by a single person on behalf of himself and others. It was the business of the censors to let the taxes. The publicani gave security to the state for the due performance of their contract; and their property, as well as that of their sureties, was liable to the amount of their obligations.

Among the remedies which the publicani had against those who were bound to pay vectigal, was the 'pignoris capio,' which seems to have been a kind of distress (Gaius, iv. 28); but after the old forms of action were changed, it was not usual actually to seize the property, but a fiction was introduced into the formula, by virtue of which the person who owed the vectigal might be condemned in a sum of money equal in amount to what he must have paid in order to redeem his property if it had been seized.

PUBLI'COLA, PUBLIUS VALE'RIUS. His original name was Publius Valerius, and the surname Publicola was given to him as a distinction for his republican virtues. He was of Sabine origin, and the son of Volesus. During the tyrannical government of Tarquinius Superbus, he is said to have been distinguished for his riches, wisdom, and affability. The first time that we find him taking an active part in the affairs of Rome was shortly before the expulsion of the Tarquins, when, with Sp. Lucretius, he went from Rome to Collatia to avenge the violence done to Lucretia. He strenuously assisted Brutus in effecting the banishment of the Tarquins (Plut., *Publ.*, 1; Liv., ii. 2); and when, after the establishment of the consulate, Tarquinius Collatinus had resigned his office, P. Valerius was appointed consul in his stead. In the ensuing war of the Tarquins, who were aided by the Veientines and Tarquinians, Valerius commanded the Roman infantry, and gained a great victory near the forest of Arsia (509 B.C.). Brutus, his colleague, fell in the battle. Valerius, with the spoils of the enemy, returned to Rome in triumph (Liv., ii. 7; Plut., *Publ.*, 9), where on the next day he solemnized the obsequies of his colleague. Valerius now had no colleague appointed in the place of Brutus, and he wished to remain sole consul, that he might not be thwarted in his plan of confining the consular power within proper limits. The election was thus delayed; and when, in addition to this, he built a stone house on the top of the hill Velia, which looked down upon the Forum, near S. Francesca Romana, he excited among his fellow-citizens a suspicion that he aimed at the kingly power. He himself in his innocence was unconscious of the feelings which he was exciting, and as soon as he was made aware of the rising suspicion, he appeared before the assembly of the people (populus), and, as a sign of respect, lowered before them his fasces, from which the rods had been previously taken out. He then addressed the people, and, to convince them of his innocence, he stopped the building and ordered the part which was already finished to be pulled down. The people, thus ashamed of their unfounded suspicions, granted him a piece of ground at the foot of the Velia, where he might build his house, and at the same time the privilege of having the doors to open out into the street, while the doors of all other Roman houses, like our modern doors, opened into the house. The respect which he had shown to the populus, whom he had clearly acknowledged as the source of his power, procured him the name of *Publicola*. He still remained sole consul, and now began to carry out his plan. He first filled up the vacancies in the senate which had occurred during the late revolution by adding 164 senators (Niebuhr, *History of Rome*, i. 525, &c.), and then carried several laws to prevent the restoration of the kingly government; he also secured to the plebeians the right of appeal to a tribunal of their own order from a sentence pronounced by the consul which inflicted bodily punishment (Plut., *Publ.*, 11; Liv., ii. 8; iii. 55; x. 9). He is also said to have established a public treasury in the temple of Saturn, for the management of which two quaestors (treasurers) were appointed. (Comp. Niebuhr, *loc. cit.*) After he had introduced these beneficial and popular measures, he held the comitia for electing a successor to Brutus. The curiae appointed Sp. Lucretius, who, being at a very advanced age, died a few days after, and in his place was elected M. Horatius Pulvillus, who at the close of the year was re-elected to the consulship along with P. Valerius (508 B.C.). Respecting the difficulties connected with the first consulship of Valerius and his several colleagues, see Niebuhr, 'Hist. of Rome,' i. 535, &c. In the war with the Etruscans [PORSENA] which broke out in this year, Publicola and his colleague were wounded, and the Romans retreated across the Tiber, within the city. But Publicola subsequently made great havoc among the Etruscans by a stratagem. The celebrated census of Publicola (Dionys., *Hal.*, v. 75, ed. Sylburgh), at which 130,000 adult Romans were registered, is said to have taken place in the second consulship of Publicola. During the siege of Rome by Porsena (Plut., *Publ.*, 16), or, according to Livy, after the battle of Aricia, Publicola was made consul a third time, with T. Lucretius (507 B.C.). It was in this year, according to the tradition followed by Plutarch (*ibid.*), Porsena attempted to negotiate for the restoration of the Tarquins, to which Publicola offered the most determined opposition. Among the hostages given to the Etruscan king was Valeria, the daughter of Publicola, and it was she who sent the maidens back, when, headed by Cloelia, they had made their escape.

Towards the end of this year the Sabines invaded the Roman territory, upon which M. Valerius, brother of Publicola, and P. Postumius, were appointed consuls. Marcus, aided by the advice and the presence of his brother, gained two victories, and in the last battle he slew 13,000 of the enemy without any loss on the Roman side. For this Marcus received great rewards, and was honoured with the same privilege as his brother, of having the doors of his house open into the street. (Plut., *Publ.*, 20.) But when the Sabines, after their defeat, united their forces with those of the Latins, and the danger thus became more threatening, Publicola was made consul a fourth time, together with T. Lucretius. The consuls set out against the enemy, who were already weakened by the desertion of some of their leaders, and, after ravaging the country, they gained a battle, in which the enemy was so much reduced that he ceased to be formidable, and the consuls, with rich spoils and numerous captives, returned to Rome in triumph. After this triumph, the new consuls for the following year were elected, and Publicola soon afterwards died, or, according to Plutarch, put an end to his own life. Niebuhr thinks that, according to the original legend, Publicola died in the battle of Regillus, 496 B.C. He was buried at the public expense, which must be considered as an honourable distinction, and not, as Livy thinks, as a proof of his poverty, and the Roman matrons mourned for him a whole year, as they had done for Brutus. The citizens decreed that the body should be interred within the city near the Velia, and that the whole house of the Valerii should enjoy this same privilege, for which however, in subsequent times, a symbolical ceremony was substituted.

The real history of Publicola is entirely disfigured, and has come down to us in the garb and with all the embellishments of poetry. The fact that Publicola is represented consul for three successive years, together with the fact that he pulled down his house on the hill Velia, and the extraordinary distinctions granted to him and other members of his house, have led Niebuhr to suppose that, after the banishment of the Tarquins, the Valerian house for a time possessed the right of exercising the kingly power, for and on behalf of the Tities, by one of its members; and he looks upon Publicola's taking up his residence at the foot of the Velia as a pledge of his intention to exercise his royal authority as befitted a citizen. (Niebuhr, *Hist. of Rome*, i., p. 538.)

PUBLIUS SYRUS, a native of Syria, was brought when a boy to Rome as a slave, but he met with a kind master who took care of his education, and eventually gave him his freedom. He excelled in writing mimi, which were in great vogue at Rome in the latter times of the republic. [MIMES.] Publius lived in the time of Julius Caesar, who on a public occasion gave him the preference over Laberius and other contemporary mimographers. (Aulus Gellius, xvii. 14.) Publius appears to have been more correct and moral in his writings than authors of mimi generally were. St. Jerome (*Epistola ad Laetam*) says that the Romans used to read his works in their public schools. His works are lost, but several of his moral apophthegms, which have been preserved by Seneca, Gellius, and other antient writers, are remarkable for their laconic precision and justness of sense. They have been collected and printed at the end of several editions of Phaedrus.

PUCCI'NIA, a genus of Fungi well known to farmers under the name of mildew. It is distinguished from other parasitical genera by its spore-cases being elevated upon long slender stalks and divided internally by one or two horizontal partitions into two or three separate cavities; the spore-cases arise from a spawn or matrix which is dispersed among the living tissue of the plant on which they grow. A considerable number of species have been distinguished by writers on fungi, and thirty-eight are enumerated as inhabitants of this country. They all grow upon the living leaves or stems of plants, and are generated in their interior, bursting through the epidermis when ready to scatter their seeds or spores; by what means the latter are introduced into the tissue has never been satisfactorily explained: some writers imagine the seeds to be introduced through the stomates from the atmosphere where they float; but it seems more probable that they are absorbed by the young roots, and carried upwards in the current of vegetation, a mode of introduction which their extremely small size renders quite possible. The mildew of corn is the *Puccinia graminis*, which makes its appearance on the straw and leaves in the form of dark grey or black lines and patches, broken in outline in consequence of their running irregularly together. Each line consists of numerous minute spore-cases, which are individually black when quite ripe. The plant appears in all corn-fields in all seasons, but its injurious effects are only observed in wet seasons, or in places where, from whatever cause, the straw becomes very rank; in the latter instance, the spore-cases, from their great abundance, attract from the straw the fluid food which was intended for the support of the grain, intercepting it in its passage upwards, and thus cause the ruin of the crop. In a disease of this kind there seems no hope of discovering a remedy, for the earth is undoubtedly well stored with the spores of Puccinia in all places and in all seasons.

PUCCOON. This name is given in the United States of America to a red vegetable pigment employed by the Indians, and hence has been transferred to the plant that produces it. By some it has been ascribed to Sanguisorba Canadensis; but Pursh asserts that it is obtained from the root of Batschia canescens, a Boraginaceous plant, while the American writers with one accord apply the name to Sanguinaria Canadensis, a Papaveraceous plant, whose roots yield, when wounded, a deep orange-red fluid.

PUDDING-STONE. [CONGLOMERATE.]

PUEBLO. [MEXICAN STATES.]

PUERPERAL DISEASES. Under this term are included all those diseases which arise out of the state of pregnancy: they are not however, as the name would seem to imply, peculiar to this condition, but incidental only; and they are so far modified by it as to require some allusion to their character and mode of treatment. Among the most alarming of these diseases, and the earliest to make their appearance, are puerperal convulsions; they consist of epileptic seizures, and their character differs in no respect from the ordinary epileptic fits already described in the article EPILEPSY: we therefore shall merely observe in the present place, that convulsions are liable to occur at any time after the sixth month of utero-gestation; but, for the reasons about to be stated, the majority of cases are met with during labour. When they occur after delivery, they are generally connected with a loaded state of the large intestine, or with a state of exhaustion from hæmorrhage. The cause of these attacks must be looked for in the state of the viscera and large blood-vessels at this period: during gestation, these parts are subjected to a constant and increasing degree of pressure from the gravid uterus, the natural tendency of which is to produce local congestion of the circulating fluid, and an undue accumulation of the excretions within the intestines. At the time of parturition this pressure is materially augmented by the contractile efforts which are made to expel the infant; and the mechanical obstacle thus offered to the flow of blood through the abdominal aorta, determines it in unnatural quantity to the brain. Hence this state of things, if not remedied, may not only produce the disease we have just been considering, but may even give rise to apoplexy. The treatment is obvious, and consists in relieving the vascular system by general and topical bleeding, and unloading the intestines by brisk cathartics.

But by far the most important and the most dangerous of puerperal diseases is puerperal peritonitis [PERITONITIS], called also puerperal inflammation, puerperal fever. It usually attacks women a few days after delivery, and seems to have no connection with the duration or the severity of labour. This fatal disease varies so much in the type of the inflammation as to be scarcely recognised as the same affection in different individuals and at different periods, the accompanying fever being sometimes strictly inflammatory, and at other times typhoid. In its most dangerous form it is characterised by a remarkable prostration of the vital powers, and by a countenance expressive of extreme anxiety and distress. The pulse is frequent and feeble; the abdomen tympanitic, and unable to bear the slightest pressure; the bowels are constipated, and vomiting is not an unfrequent attendant. As the disease proceeds, the lochial discharge and the secretion of milk are suppressed; and towards its termination, a total cessation of pain sometimes occurs, and the patient dies, often in full possession of her consciousness to the last. This severe form of puerperal fever is most frequently epidemic, and many believe it to be highly contagious. The lesions met with in this disease are chiefly manifest in the peritoneum; but in the worst cases, the substance of the uterus itself, and the large veins in its vicinity, present evidences of inflammation. The treatment of puerperal fever is peculiarly difficult 'every case,' observes one of our most celebrated accoucheurs, 'must be isolated and studied alone, and looked at by itself, and its management must depend upon its type and its stage.' Bleeding, general and topical; counter-irritation, by means of blisters or spirits of turpentine, applied to the abdomen; purging, by the exhibition of the last-named medicine, or by large doses of calomel; and the latter, given to excite ptyalism, have been the principal remedies used for combating this formidable malady. But the prostration of the vital powers is, in some cases, so extreme, as to afford us little chance of putting into requisition the only means which we possess of combating the inflammatory symptoms. A form of disease sometimes occurs after delivery, which, from its resemblance in some particulars to the one we have just alluded to, requires notice. It is due to stomachal and intestinal irritation; and is ushered in by rigors, followed by great heat of skin, a full and frequent pulse, and loaded tongue. The abdomen may be tumid and painful on pressure, and the head may be affected by symptoms of phrenitis, as intolerance of light, noise, wakefulness, and delirium. The affection of the head and that of the abdomen frequently coexist or alternate in the same case, and this conjunction of the two affections serves to assist in the diagnosis between peritonitis and the present complaint. As it is of the greatest importance in a therapeutic point of view to distinguish puerperal inflammation from intestinal irritation, much may be learnt by the exhibition of large injections of warm water, an examination of the evacuations, and an observation of the effects thus produced upon the disease. In intestinal disorders, the fæces will be found to be scybalous, or at least offensive and dark-coloured, and in large quantities; and the relief obtained will be found to depend upon the proper evacuation of the bowels. Another characteristic of intestinal irritation is the susceptibility to fainting upon blood-letting. The treatment of this disorder may be summed up in the words of Dr. Marshall Hall. 'In peritonitis,' he observes, 'the freest blood-letting must be aided by purgative medicines; whilst in intestinal irritation, the freest and fullest evacuation of the intestines must be aided by blood-letting; for although both blood-letting and purging are to be used in every case, yet the former is the remedy in inflammation, and the latter in intestinal irritation.' In describing the last-mentioned disease, we have alluded to the combination of cerebral symptoms, which so frequently are present. This disturbance of the intellectual functions is sometimes so great and so continued, as to lead to the supposition that the brain is the seat of some active inflammatory disease; and were we, acting upon this supposition, to have recourse to antiphlogistic remedies only, we should probably lose our patient. This alarming disorder has been termed puerperal insanity, or puerperal mania. It comes on rather insidiously: there is a little excitement during the day and sleeplessness at night; then delirium, and then actual mania; the pulse is somewhat accelerated, the tongue furred, the skin hot, the bowels costive, and the secretion of milk diminished. It seems to arise from a combination of causes acting upon an originally irritable temperament, but rendered still more so by intestinal disorder and hæmorrhage, or by the debility consequent upon suckling. Blood-letting in these cases is generally fatal; the treatment consists in regulating the bowels and preserving extreme quiet of mind and body, with a nutritious but not stimulating diet. When speaking of puerperal fever, it was observed that the large veins in the vicinity of the uterus frequently presented traces of inflammation. Uterine and crural phlebitis however occurs as a distinct disease, and has been described under the terms of phlegmasia dolens, œdema puerperarum, the white swelling of lying-in women, &c.; but it is only within a few years that the true nature of this disease has been fully understood, having been first pointed out to the profession by the late Dr. Robert Lee. It may appear as early as the fourth day after delivery; but, in the majority of cases, it is not till the second or third week that it makes its appearance; and, in many instances, attacks women who are recovering from puerperal fever. It is ushered in with rigors, and these are succeeded by heat, thirst, and other symptoms of pyrexia. There is a sense of pain, first experienced in the uterine region, and gradually descending in the course of the iliac and crural veins down one leg, accompanied by swelling and great tenderness upon pressure along the course of the vessels, which are hard as a cord, and roll under the fingers. In some cases an erythematous redness of the integuments of the limb is met with; but in the majority they are smooth, shining, tense, and colourless. The power of moving the limb is completely lost, and it is greatly and uniformly swollen throughout its whole extent. Sometimes, after the inflammation has subsided in one limb, the other is attacked in a similar way. The pain and febrile symptoms usually diminish within a few days after the occurrence of the swelling; but sometimes the pain is excruciating throughout the whole period of the acute stage of the disease. The duration of the acute stage is various in different individuals; in the greater number of cases it terminates in two or three weeks; but the limb still remains powerless and œdematous. In some women the limb does not return to its natural state for many months, or years, or even during life. The appearances on dissection which are met with in this disease are similar to those which characterise inflammation of the veins generally. The causes of this affection are supposed to be owing to the orifices of the veins in the lining membrane of the uterus being left open after the separation of the placenta, by which a direct communication is established between the cavities of these veins and the atmospheric air. The treatment of phlegmasia dolens consists in the local abstraction of blood by leeches applied to the groin, and in the course of the large venous trunks of the limb; hot fomentations to the part, and the administration of diaphoretics and saline purgatives. After the inflammatory symptoms have subsided, the limb may be supported by a bandage, and slight *frictions* made use of. There is a disorder occasionally met with in the puerperal state, which, from not being mentioned in the article HÆMORRHAGE, must be alluded to in this place. The symptoms about to be detailed are owing to loss of blood, uterine hæmorrhage during and shortly after parturition being not an unfrequent occurrence. The more immediate effects of hæmorrhage are faintings; and where the loss of blood has been great, this symptom is sometimes so prolonged as to be not only dangerous, but fatal. It is the more remote consequences of loss of blood that we are to speak of in this place: we have seen already how a combination of this with intestinal disorder and other irritating causes gives rise to puerperal mania; we shall now view the effects of hæmorrhage as they are met with uncombined with the conditions previously alluded to. This condition of system has been called by the French pathologists a state of anæmia, and is characterised by a pallid condition of the skin; great nervous excitability; a throbbing of the temples; vertigo; tinnitus aurium; a frequent, jerking, compressible pulse; a great tendency to faint on the slightest exertion, or in the upright position; palpitation of the heart; hurried respiration; and, generally, great thirst. The treatment to be adopted in anæmia from loss of blood, consists in maintaining a perfect quiet of mind and body, in a free exposure of the patient to fresh air, a mild but nutritive diet, and a regular but not an over active state of the bowels. The symptoms we have just enumerated as arising from loss of blood are sometimes met with, in a mitigated form, at a much later period of the puerperal state, and arise from the drain occasioned by superlactation. The treatment of these cases is more simple, and consists generally in the weaning of the child, the adoption of a more nutritive diet, and change of air. With respect to what are called milk abscesses, they arise from the inflammation consequent on over-distention of the lactiferous tubes, and require the same mode of treatment as is adopted in abscess when it occurs in other parts than the breast. [ABSCESS.] They are best prevented by permitting the infant to suck within a few hours after delivery, and by repeating this act frequently. When the secretion of milk is excessive, the bowels should be kept freely open by saline purgatives.

PUERTO BELLO. [PANAMA.]

PUERTO CABELLO is a town and port in the republic of Venezuela in South America, and in the department of the same name, in 10° 30′ N. lat. and 68° 10′ W. long. It is situated on the north coast of South America, and is considered the best port on the south coast of the Caribbean Sea. A narrow low island extends about two miles east and west. It is overgrown with mangrove-trees, and at its eastern extremity is united to the continent by a shoal. To the south of this island is the harbour, which is formed on the west by a peninsula projecting northward and terminating about 180 yards from the island. The space between the peninsula and island forms the entrance of the port, which is deep, but so narrow that only one vessel can pass through it at a time. The small bay, of which the northern part forms the harbour, extends southward, and at its extremity turns southwest. The southern portion of it contains several islands overgrown with mangrove-trees. The harbour itself is deep and spacious, and the largest vessels may lie there in safety; for though a heavy surf breaks along this coast of South America, its force is broken by the intervening island, and as the entrance of the harbour is from the west, the surf does not penetrate to the interior. Accordingly the water of the harbour is always as smooth as that of a lake. The town consists of the city and of the suburb. The city is situated on the northern part of the peninsula, through which a cut has been made, by which the site of the city is converted into an island. It is small, but contains several good houses, and is well fortified. Neither the church nor any of the public buildings require particular notice. There are some good warehouses, and an excellent wharf faced with stone, both erected by the Guipuzcoa Company, when it had obtained the right of exclusive commerce with this part of America. Vessels of large burden lie close to the wharf, and as they can be easily and securely fastened to the shore, anchors are seldom required. To this circumstance it is said the harbour owes its name, as implying that vessels may here be secured by a single hair (*cabello*); but Humboldt asserts that it acquired this name from one Antonio Cabello, who carried on an extensive illicit traffic with Curaçao before the Guipuzcoa Company built a town here. Over the cut which separates the city from the suburb is a bridge of wood, and a gate on it, which is shut every night. The suburb is much more extensive than the city, but built with less regularity. The houses are low, only a few of them having an upper story. It is the residence of the merchants and working people. Both places contained at the beginning of this century a population of 9000. Later accounts are wanting. The commerce of the town is considerable, and the produce of the fertile countries lying to the south of it, as the valley of Aragua and the plain of Valencia, is exported from it. The exports consist of cacao, coffee, sugar, and a great number of mules. Formerly 10,000 mules are said to have been annually shipped for Jamaica and other parts of the West Indies. The principal commercial relations of Puerto Cabello are with Jamaica and Curaçao, but as to this matter also more recent information is wanting.

(Humboldt's *Personal Narrative*; Depons, *Voyage à la Partie Orientale de la Terre Ferme*; Semple's *Sketch of the Present State of Caracas*.)

PUERTO DE SANTA MARIA, or St. Mary's Harbour, the 'Portus Menesthei' of the antients, is a large seaport of Spain, in the province of Cadiz, five miles north-east of that city, at the mouth of the river Guadalete. The town is well built, well paved, and kept very clean. The Calle Larga, or Long Street, which is about a mile in length, has a very handsome appearance, owing to the number of fine shops and elegant buildings. The public walk, called Paseo de la Victoria, is a very agreeable spot during the hot summer days, when it is very much frequented by the inhabitants. There is also a beautiful public garden on the banks of the Guadalete planted with all sorts of exotic trees. The quay is well contrived, but large ships cannot come up to it, on account of the numerous sand-banks by which the mouth of the river is obstructed. On the west side of the town there is a very fine prospect of the bay and town of Cadiz, which, seen from an eminence on the road to Xeres, looks as if it rose out of the waves of the ocean. The principal church, a building of tolerable antiquity, is chiefly remarkable for a profusion of gorgeous ornaments not in the best taste, as well as for a few pictures by the best masters of the Sevillian school. There are within the town six convents for men and three for women, but these have been shut for some time. This town is the capital of a considerable district, and is occasionally the place of residence of the civil and military authorities of the province of Cadiz. The climate is excellent, having little either of the severity of cold in winter or scorching heat in summer, for which reason the wealthy inhabitants of Cadiz make it their place of residence during the summer. The only manufacture of consequence at present in the town is soap, of which large quantities are yearly exported. There are also a few manufactories of hats and one or two brandy-distilleries. The land around the town is in a tolerable state of cultivation, and yields abundant crops of corn, oil, and wine, which last article is imported into England under the name of sherry. Puerto de Santa Maria is the birth-place of José Cordero, a Franciscan friar, who made the clock in the tower of the cathedral of Seville, and of Enziso Monzon, who translated the whole of Virgil into Spanish verse, Cadiz, 1698, 4to. Lat. 36° 31′ 8″ N.; long. 6° 18′ W.

PUERTO REAL, a town in the south-west of Spain, in the province of Cadiz, five miles east of that city, and on the bay of Cadiz. It was founded by Ferdinand and Isabella during the Moorish war, whence its name 'Royal Harbour.' The streets are airy, clean, and straight, and the houses well built, with flat roofs. The market-place, which is situated in the centre of the town, is a spacious square surrounded by stone arcades, under which all sorts of provisions are exposed for sale. There is also a very handsome stone pier and several commodious wharfs of the same material for the unlading of ships. Close to one of the latter is a large reservoir, from which water is daily conveyed to Cadiz for the supply of the town and the ships in the bay. During the Peninsular war, the French erected their batteries against Cadiz at Puerto Real. The population, which at the beginning of the last century amounted to nearly 7000, is now reduced, according to Miñano's estimate, to 3000. There is little or no trade, except in salt, this being the great depôt of all that which is collected between the island of Leon and the bay of Cadiz.

PUERTO RICO, an island of the West Indies, belonging to Spain, is the smallest of the Greater Antilles, and the most western of the Leeward Islands. The name of Leeward Islands is derived and corrupted from the old Spanish navigators, who divided the islands into two classes, Bantovento and Sotavento, the former comprising all the Caribbee Islands, and the latter Cuba, Jamaica, San Domingo, and Puerto Rico. The English have applied both names to the Caribbee Islands, the Windward Islands extending from Trinidad to Martinique, the Leeward Islands from Dominica to Puerto Rico.

This island is in the form of a parallelogram, 84 miles long and 35 broad, and it contains about 2940 square miles. It lies between 17° 50′ and 18° 30′ N. lat., and 65° 39′ and 67° 11′ W. longitude. The population, in 1836, was 357,086. Puerto Rico is bounded on the north by the Atlantic, on the west by the Mona Passage, which separates the island from San Domingo, with a width of about 75 miles, on the south by the Caribbean Sea, and to the east lie the Virgin Islands.

A range of mountains of considerable height runs through the centre of the island; the highest part is that of Luguilla in the north-east. The Yungue, the most elevated peak, is about 3700 feet high. From the central chain many inferior ridges run north and south, containing between them valleys of great fertility watered by rivers; these valleys widen as they approach the sea. The valleys of the north side produce the best pasturage; those of the south grow most sugar. The coast abounds with harbours: those on the north coast are generally unsafe during the prevalence of the northerly winds, in consequence of the heavy surf which then rolls in upon the shore. The same cause creates bars at the mouths of the rivers on the north coast. The port of San Juan is however perfectly sheltered by the narrow island on which the town and fortress stand. Aguadilla is an open roadstead at the north-west extremity of the island and much exposed, but from its position and the abundant supply of provisions and water which it affords, it is much visited. It was here that Columbus effected his first landing in Puerto Rico. The ports of Guanica and Jobos on the south coast are very large, afford excellent anchorage, and are easily defended. Few countries are so well watered by rivers as Puerto Rico. Seventeen rivers rising in the central chain run into the sea on the north coast, of which the rivers Manati, Loisa, Trabajo, and Arecibo are deep and broad: though there are bars at their mouths, small vessels with cargoes can safely cross them at high water. Nine rivers fall into the sea on the east coast, sixteen on the south, and three on the west, where also there are several fresh-water lakes that communicate with the sea. These rivers are well stocked with fish. During the last sixteen years many good roads have been constructed and bridges built. The principal roads are from San Juan to Aguadilla and Mayagues, from Ponce to Guayama, and from Faxardo to the capital; they are of solid construction, being of gravel or stone cemented. The greater number of bridges are of wood, but several are of stone.

The soil of Puerto Rico is of the richest and most varied description; there is the deep rich soil required for the cultivation of the sugar-cane, the cool mountain valley for the coffee plantation, the most luxuriant pasture, the moist spot favourable for the cocoa-nut and the irrigated rice-fields. The pasture-lands are principally on the north and east coasts; the cane-fields on the south and west. In 1830 there were 109,478 acres under cultivation, and 634,506 in pasturage. The quantity of sugar produced in 1830 was 414,663 quintals, which at the rate of 4 dollars a quintal will give 1,658,652 dollars. Capital is continually directed to this island, and fresh land is taken into cultivation yearly to a large amount. The proportion of sugar produced from an acre is very great compared with the produce of the other West India islands, the produce of Jamaica being about 10 quintals; Granada, 15 quintals; St. Vincent, 25 quintals; and Puerto Rico, 30 quintals to the acre. About 14,000 head of horned cattle are annually exported and 23,000 consumed in the island; the price is about 100 dollars for three full grown bullocks.

The climate of Puerto Rico seems to be more favourable to Europeans than that of most of the other islands in the West Indies. According to a table given by Colonel Flinter from the observations of Don José Vertéz, on an average of five years, the maximum height of the thermometer is 92° Fahr., in the month of August, and the minimum 60°, in December, taken at noon. The salubrity may be partly ascribed to the very general cultivation and the absence of stagnant waters. There are two rainy seasons: the first commences in May and lasts about twenty days, when the sky clears up, the sun shines unobscured, and a perfect calm lasts till about 11 A.M., when the sea-breeze sets in. June and July offer little variation. August is the hottest month; the heat is then suffocating, the sea-breeze has died away into a calm, only occasionally broken by a faint breeze, and the night brings no relief, for there is no land-wind. This is the most sickly season for Europeans. This island suffered much from a hurricane on the 27th of August, 1825. About September the clouds have again gathered, and the rain pours down in torrents such as can scarcely be conceived by those who have not witnessed it. In a few hours from the commencement of the rain the rivers have overflowed, and the low lands are completely inundated. The quantity of rain which falls during the year in Puerto Rico has not been ascertained by actual measurement: in the island of Barbadoes, where it is much less, the quantity is about seventy inches. In October the weather becomes much cooler. In November the north and north-east winds set in, and blow till January, during which months the weather is occasionally cool.

Puerto Rico was discovered by Columbus in 1493. The natives, knowing that the Spaniards had subjugated St. Domingo, looked on them as beings of a superior order, and submitted to them for some time, when, having by experience discovered the fallacy of their opinion, they rose on the Spaniards and slaughtered many of them. On this the Spaniards exterminated the greater part of the natives, and the remainder have become so intermixed with the conquerors, that there is no mark of distinction between the races.

The island now contains fifty-eight towns and villages. San Juan, the capital, contained, in 1828, 800 houses of brick and stone: it is situated on the north side of the island, in 18° 29′ N. lat. and 66° 13′ W. long. San Juan is built on a narrow island connected at one end with the mainland by a bridge. The town is placed on the slope of a hill, and has regularly built streets, which cross each other at right angles. It is enclosed by strong fortifications, and contains about 30,000 inhabitants. The harbour lies between the town and the mainland. S. Juan is the seat of government. The chief public buildings are, the cathedral, a large unfiecclesiastical building, a theatre, military hospital for 250 patients, another for females, a gaol, a house of correction, whose inmates labour at the public works, a town-house, which is a handsome building, an arsenal, and a custom-house. There are four churches and two chapels. A British force under Sir Ralph Abercromby made an unsuccessful attempt to carry the place in 1797.

Mayaguez and Aguadilla on the west, Ponce on the south, Humacao on the east, and Peñuelas and Cayey in the interior, are considerable towns. The rest are very small, consisting generally of a large square with a church and a few straggling houses.

The government of Puerto Rico is administered by a captain-general, who has the supreme military command, but his civil authority is in some degree controlled by an officer who is called his legal adviser, and who is appointed to assist the governor and give decisions in those cases with which it is not supposed that a soldier can be conversant, and for the correctness of which the legal adviser is responsible. The governor must however sign the decision or sentence before it is valid, and he may act contrary to the opinion of the adviser, at his own risk. The court of royal audience is invested with the superintendence of all other authorities, and is consulted by the governor on all important occasions. The intendant is an officer ranking as a major-general, whose duty it is to watch over the revenue. There are two courts of cabildo in the island, which superintend the police and municipal affairs. The governor is president of it. The court is composed of two alcaldes, elected annually, a regidor, and a syndic. They decide all causes under 100 dollars. In each of the seven towns and villages which form the head of a department, a magistrate resides called the alcalde mayor. In the smaller towns there are inferior magistrates, who are annually appointed by the captain-general. They are responsible to the Court of Royal Audience for the discharge of their duty. The ecclesiastical tribunal is composed of the bishop and provisor, and takes cognizance of affairs connected with the church. The governor is vice-regal patron, an office which empowers him to check abuses. There is a naval tribunal presided over by the commandant of the marine. The consulado is established for the decision of all mercantile disputes.

Puerto Rico presents the singular appearance of white men working in the same fields and at the same labour as coloured men without being considered as degraded by it. This arises partly from the island having been a penal settlement, where the convicts were put to field labour, and partly from the price of labour being so low as not to afford remuneration for the risks of the slave-trade. The antipathy which exists in other colonies and in the United States of North America between the white and coloured races does not exist here.

The usual proportion between the white population and the slaves is reversed in Puerto Rico. The following table from the statistical returns made by the Board of Trade show the increase of the population of late years:—

	1802.	1812.	1820.	1827.	1830.	1836.
Whites	78,281	85,662	102,432	150,311	162,311	188,869
Free Mulattoes	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]	[illegible]
Free Blacks	16,414	[illegible]	20,191	[illegible]	26,857	[illegible]
Slaves	13,333	17,536	21,730	31,874	34,240	41,818
	163,192	183,014	230,622	302,672	323,838	357,086

The inhabitants are classed by the census according to their nations, thus:—

Spaniards, Creole and Peninsular	300,500
French	1,474
English and North Americans	427
Danes	212
Dutch	485
Italians	273
Germans	62
Africans	15,728
	319,161

And according to their professions and trades,—

Labourers	143,311
Carpenters	969
Shopkeepers	839
Merchants	820
Shoemakers	688
Dealers	544
Masons	282
Tailors	309
Coopers	341
Smiths	124
Not distinguished	15,379
Having no trade or profession	155,542
Total	319,161

The proportion which the different races bear to each other is as follows:—Whites 50½, free people of colour and blacks 39½, and slaves 11¾ per cent.

The proportion of sexes is in favour of the females, excepting among the slaves:—Whites,—males 49½, females 50½; free coloured,—males 48¾, females 51¼; and slaves,—males 57½, females 42½. In the gross population, males 49, females 51.

The number of marriages in 1828,—

Whites.	Free coloured.	Slaves.	Total.
734	182	40	1956

In 1830 the number had increased to 2152, of which 150 were among slaves. Of births the total number is 4½ per cent. per annum of the population, thus distributed:—

Whites	9½ per cent.
Free coloured	3¾ ,,
Slaves	5¼ ,,

Giving 1 birth to every 26½ whites.
,, ,, 17½ free coloured.
,, ,, 17¾ slaves.

The deaths amount annually to 2¾ per cent. of the whole population:—

	Total.	Males.	Females.
Whites	2½	2¾	1¾
Free coloured	1½	3	1½
Slaves	2¾	3½	2¼

Giving 1 death to 40½ of the whites.
,, ,, 31¾ of the free coloured.
,, ,, 27 of the slaves.
,, ,, 37 of the entire population.

The number of the slave population is probably increasing with the demand for labour consequent on the additional cultivation. An extensive system of kidnapping negroes from other islands, chiefly from the British Leeward Islands, has prevailed of late years, many of whom have been discovered in Puerto Rico. The daily allowance to a slave is seven or eight plantains, or an equivalent in yams or other roots, 8 ozs. of salt-fish, 4 ozs. of rice or peas; also three suits by the year, each consisting of a cotton shirt, trowsers, handkerchief, hat, or cap, and a woollen shirt or jacket. They work nine hours a day, except during the harvest, when they must work thirteen hours. Marriage is promoted among the slaves, and the master of the male or female is obliged, on their marriage, to sell his slave, at a price fixed by arbitration, to the owner of the other.

The annexed table shows the quantity of produce exported from the island of Puerto Rico in the year 1836:—

Sugar	1,198,868¼	quintals.
Coffee	52,772¼	quintals.
Hides	3,686	quintals.
Molasses	1,724,051	gallons.
Raw Cotton	19,522¼	quintals.
Unmanufactured:—		
Tobacco	49,542	quintals.
Cigars	8,000	quintals.
Rum	359¼	bocoyes.
Cattle	4,211	head.

The quintal is equal to 100 lbs. avoirdupois.

The fanega is equal to one-fifth of a quarter.

The arroba is equal to 4¼ gallons, and contains 32 cuantillas.

Puerto Rico contains 14,435 houses in town and country, 25,696 huts and cottages, 1555 sugar estates, and 124 coffee estates.

Puerto Rico has no mines or manufactures, no indigenous quadrupeds, scarcely any birds except a few species of water-fowl and some parrots, and no monkeys. The cane-fields are infested by rats of a large size, which at times commit great ravages.

A royal decree was issued in the year 1815 for the promotion of the commerce and agriculture of Puerto Rico, from which time the commercial prosperity of the island has been rapidly advancing.

There are two classes of merchants: consignees of cargoes imported in European and American vessels, who receive a commission on the purchase and sale of merchandise; and those who with capital of their own purchase goods and retail them. There is scarcely such a person as a wholesale merchant in the island. No foreigner, unless naturalised, can make purchase or sale in his own name; five years' residence in the dominions of Spain entitles him to naturalization.

There is an ad valorem duty of 17 per cent. on the importation of foreign goods; the consequence of which is a contraband trade with St. Thomas's and other islands, of so great extent as to falsify considerably the tables of imports. The trade with America consists in salt-fish, flour, butter, grain, and lumber; with France, in linens, cambrics, ornaments, toys, and jewellery; with England, cotton goods, hardware, and earthenware: England takes a great quantity of cattle for the supply of her colonies; with Spain, olives and brandies, wines, dried fruits, anchovies, &c.; with the German States, in glass, sword-blades, linens, hams, &c.

The following is a statement of the total value of imports and exports, and amount of customs duties received in the island of Puerto Rico in each of the years 1835 and 1836:—

Years.	Value of Imports. Dollars.	Value of Exports. Dollars.	Total. Dollars.	Customs Duties, includ Tonnge.
1835	3,914,116	3,949,534	7,863,651	746,285
1836	4,005,944	4,099,576	8,105,521	800,025

The government returns state the rural and urban wealth of Puerto Rico to be 22,719,213 dollars, and the value of its agricultural produce 5,259,769 dollars, in the year 1834.

Statement of the number of vessels, distinguishing Spanish from foreign, which entered the ports of the island of Puerto Rico in 1835 and 1836:

Years.	Spanish.	Foreign.	Total.	Tonnage.
1835	750	504	1254	88,268
1836	707	521	1228	93,447

Statement of the number and tonnage of vessels, distinguishing the countries to which they belong, that entered and cleared at the island of Puerto Rico in the year 1836:

	Inwards.		Outwards.	
Countries.	Ships.	Tons.	Ships.	Tons.
Spanish	707	29,161	659	27,695
American	302	45,654	319	45,934
Danish	49	4,273	49	4,174
Dutch	13	701	13	701
Sardinian	8	1,058	8	1,058
Bremen	11	1,048	11	2,100
French	91	7,052	94	7,208
English	37	2,772	35	2,658
Swedish	7	216	7	216
Hamburg	3	541	3	541
Total	1228	93,446	1198	92,285

Statement of the value of merchandise imported into and exported from the island of Puerto Rico, distinguishing the trade with each country:

Countries.	Imports. Value. Dollars.	Exports. Value. Dollars.
Spain	485,823	1,150,536
Spanish Colonies	1,848,405	413,252
United States	1,121,900	1,876,720
Denmark	339,394	164,556
Holland	75,342	9,156
Sardinia	50,245	79,204
Bremen	43,577	107,521
France	31,116	145,687
Great Britain	5,084	65,353
Sweden	4,208	3,568
Hamburg	814	84,019
	4,005,908	4,099,572

PUFF-BALL. [LYCOPERDON.]

PUFF-BIRDS. [BARBETS, vol. iii., p. 434; KINGFISHERS, vol. xiii., p. 227.]

PUFFENDORF, SAMUEL, an eminent historical and juridical writer, was born in the year 1632, at the small town of Chemnitz in Saxony, in the neighbourhood of which place his father was settled as a Lutheran clergyman. He received the earliest rudiments of his education at Grimma, one of the three schools called Prince's Schools, founded by the elector of Saxony, in 1550. Being designed by his father for the Protestant ministry, he was removed from Grimma to the university of Leipzig, where he studied theology for several years. Accident and the tendency of his mind led him while at Leipzig to change his course of study, and about the year 1656 he went to the university of Jena, where he devoted himself to the study of mathematics, under the tuition of Erhard Weigel, whose improvements in the method of teaching natural philosophy had at that time excited great attention in Germany. About the same time Puffendorf appears to have first applied himself to the law of nature, on which subject he afterwards became a distinguished writer.

About the time that he quitted Jena, his brother, who had been employed by the chancellor Oxenstiern in lucrative and confidential offices under the Swedish government, advised him to seek his fortune in foreign diplomacy, and with a view to this ultimate object he obtained a situation as tutor to the son of the Swedish ambassador at Copenhagen. He had scarcely joined the legation when a rupture ensued between Denmark and Sweden, and the whole family and attendants of the ambassador were detained as prisoners during eight months at the Danish capital. Puffendorf employed the leisure which this captivity afforded him in investigating and arranging the principles of general law contained in the works of Grotius, Hobbes, and some other political writers. These he reduced to writing, adding to them such reflections and arguments as had occurred to his own mind. At the time of its composition this work was not intended for publication; but on visiting Holland shortly after his enlargement, he was induced by the advice of a friend to publish it; and it accordingly appeared at the Hague, in 1660, under the title of 'Elementa Jurisprudentiæ Universalis.' This work, though crabbed in style and greatly inferior in general merit to the treatise 'De Jure Naturæ et Gentium,' exhibited much closeness of thought, and contained some enlarged and original views upon the subject of jurisprudence; and the circumstance of its dedication to the elector-palatine Charles Louis, perhaps more than its substantial merits, made it the foundation of the subsequent fortunes of the author. The elector-palatine was desirous of attracting attention to the university of Heidelberg, which had fallen into decay; and as one of the means to this object, he founded a professorship of the law of nature and nations, and placed Puffendorf in the chair, entrusting him also in particular with the education of his son the electoral prince. Puffendorf commenced his occupation as professor at Heidelberg, in 1661, and the numerous auditory attracted by his lectures supplied him with pecuniary independence as well as encouragement to persevere in his juridical studies. Soon after his establishment at Heidelberg he directed his attention to the constitution of the body termed the Germanic empire; and struck with the absurdities and incongruities of this strange compound of princes, small republics, prelates, and knights, each of whom exercised within their respective territories a degree of sovereign authority, he composed a treatise exhibiting in rather strong colours the usurpations and defects of the system, and pointing out practical remedies for the grievous abuses which it had occasioned. As the existing order of things in Germany was criticised in this work with considerable freedom and severity, Puffendorf did not venture to publish it in his native country, or with his own name, but sent it to his brother Isaiah Puffendorf, who was at that time the Swedish ambassador in France, who, after showing it to Mezeray, directed it to be published at Geneva, under the title of 'Severini de Mozambano, De Statu Imperii Germanici.' This work excited very general attention in Europe, being translated into German, English, and French, and not only involved Puffendorf for several years in an active controversy with German civilians, but exposed him to the indignation of some of the more powerful constituents of the German body, and especially of the Austrian government. To avoid the possible consequences of the commotion his work had occasioned, he gladly accepted, in 1670, an invitation from Charles XI. of Sweden to become professor of the law of nations at the university of Lunden, then recently founded. About two years after his removal to Lunden, he published the great work upon which his reputation at the present day is principally founded, entitled 'De Jure Naturæ et

Gentium.' It is a very candid and accurate digest of the law of nature, and being arranged on a much more scientific principle than the work of Grotius, 'De Jure Belli et Pacis,' is more useful to the student.

Grotius has reversed the natural order of treating the subject by considering at once the artificial states of peace and war and the law of nations, without first tracing the original principles of the science as they are found in human nature. Puffendorf, on the other hand, commences with the law of nature, then considers the subject as applied to the conduct of individuals, and lastly investigates the difficult and complicated questions which arise in the intercourse of nations. 'Without the genius of his master,' says Sir James Mackintosh, 'and with very inferior learning, Puffendorf has yet treated the subject with sound sense, with clear method, with extensive and accurate knowledge, and with a copiousness of detail, sometimes indeed tedious, but always instructive and satisfactory.' (*Discourse on the Study of the Law of Nature and Nations.*)

In consequence of some of the new views contained in this work, it was virulently assailed by contemporaries, and involved the author a second time in angry controversy; but, at the same time, it raised the reputation of Puffendorf to a great height throughout Europe; and a few years after its appearance, the king of Sweden removed him to Stockholm, making him his historiographer, and giving him the title of counsellor of state. In his official character he composed and published in Latin a 'History of Sweden, from the expedition of Gustavus Adolphus into Germany, until the death of Queen Christina;' but although a promising theme for an historian, Puffendorf has not availed himself of the rich materials which were placed at his disposal in the archives of the Swedish government in such a manner as to render his narrative attractive or complete. In 1688 the elector of Brandenburg, Frederic William, invited him to Berlin, with the consent of the king of Sweden, and employed him in writing the history of his life and reign. The elector also bestowed upon him the title of counsellor of state, with an annual pension of 2000 crowns. In obedience to this engagement, he wrote and published, in nineteen books, 'Commentarii de Rebus Gestis Frederici Wilhelmi Magni, Electoris Brandenburgici,' a work which neither experienced nor deserved greater success than his previous historical performances. His employment in Berlin was considered as he merely temporary, and he intended to return to Stockholm as soon as he had completed his engagement with the elector of Brandenburg; indeed the king of Sweden always maintained his esteem for him, and a few years only before his death, and during his residence at Berlin, raised him to the dignity of a baron. He died however in Berlin, in October, 1694. A complete catalogue of the voluminous writings of Puffendorf, and an account of the various editions of each, will be found in a note to the article under his name in the 'General Dictionary,' and also in the 'Biographie Universelle.'

PUFFIN. [Alca, vol. iii., p. 59; Petrels, vol. xvii., p. 41.]

PUG, a dwarf variety of the dog, somewhat resembling a mastiff or bull-dog in miniature. The Dutch Pugs have more the aspect of the large varieties last named than the French Pugs, some of which latter are very small. Both are snappish and noisy, but capable of strong attachment to their masters or mistresses. The French Pugs are docile, and may be easily taught many amusing tricks.

PUGET, PIERRE, who has been called the Michael Angelo of France, from his ability in painting and architecture, as well as in sculpture, and perhaps also on account of a kindred enthusiasm and decision of character, was born in 1622, at Marseille, where his father practised as an architect and sculptor. It was from him that he received his first instructions in art, after which he was placed under a shipwright, or builder of galleys, to learn to carve the ornaments used in such vessels. Disgusted with the drudgery of such workmanship, he set out for Italy, and passed a considerable time at Florence, where he pursued his studies as a sculptor with great success. He next repaired to Rome, whither he was attracted by the fame of Pietro da Cortona; and not only did he become the pupil of that artist, but made such progress under him, that he accompanied him to Florence as his assistant in painting the ceilings of the Pitti palace. Instead however of remaining there, he suddenly resolved upon returning to France, and he was then only twenty-one. On his arrival at Marseille he was very well received, and was shortly afterwards commissioned to design a vessel of extraordinary magnificence, named La Reine, in honour of Anne of Austria. That princess being desirous of obtaining accurate drawings of all the antient monuments at Rome, the person commissioned by her to procure them thought that he could not do better than take Puget with him for the purpose of executing them. Puget accordingly proceeded a second time to Rome, and there spent between five and six years; but what afterwards became of that valuable collection of drawings is not known.

On his second return from Italy he executed several works in painting; but his excessive application to that art so seriously affected his health, that he renounced the practice of it, and confined himself thenceforth to architecture and sculpture. His talents met with employment at Toulon and Marseille, for which latter city he projected many embellishments, which established his reputation as an architect; and he further gave proof of his skill in engineering by different ingenious machines and inventions which he introduced into the marine at Toulon.

He was sent by Fouquet to Genoa for the purpose of selecting marble for some of the works proposed to be executed at Marseille; but that minister being shortly afterwards disgraced, instead of returning home, Puget preferred remaining at Genoa, where he produced some of his most noted pieces of sculpture, the two statues of St. Sebastian and St. Ambrosius, and the grand bas-relief of the Assumption, in the chapel of the Albergo de' Poveri, besides various architectural ornaments. At length he was recalled by Colbert, who obtained for him a pension of twelve hundred crowns, in consequence, it is said, of the earnest recommendation of Bernini. That the patronage of the one and the recommendation of the other were not discredited, is proved by his two celebrated performances at Versailles, the Milo of Crotona and the group of Perseus and Andromeda, the former of which is generally reckoned the chef-d'œuvre of his chisel, and a work that will bear comparison with the antique. He was not however to be attached to a court, even by the flattering compliments of Louis XIV. himself, but he retired to Marseille, where he built himself a small residence, which he occupied until his death, December 2nd, 1694, at the age of seventy-two.

Puget undoubtedly merited the applause that he received from his countrymen and contemporaries, but dispassionate criticism will not exactly confirm previous opinion. The historian of modern sculpture, Cicognara, speaks of Puget in rather a disparaging manner, insisting that though they manifest genius, his productions almost invariably betray inaccuracy as to proportions, want of refinement in taste, and show more of the painter than of the sculptor in their treatment, seldom producing a pleasing effect except from a single point of view. Neither the Milo nor the Perseus escapes reprehension from him; and he says that as a composition the former has been frequently surpassed by young artists who have tried their powers on the same subject.

As an architect, he must at the present day be held even lower, if, as a sample of his taste in that art, we refer to the court-yard and old building of the British Museum, designed and erected by him, and in which it is easier to perceive a kind of dull stateliness than to detect the slightest element of beauty.

PUGLIA, the antient *Apulia*, is the general name given to a large division of the kingdom of Naples, which lies east of the Apennines, and extends to the Adriatic Sea. It comprises the three administrative provinces of Capitanata, Terra di Bari, and Terra d'Otranto. In former times the kingdom of Naples was divided by geographers into four great divisions, called Abruzzi, Puglia, Calabria, and Terra di Lavoro, each of which was subdivided into three administrative provinces. Puglia is naturally divided into two regions, namely, the great plain of Capitanata, called Puglia Piana, or 'Flat Apulia,' and the hilly region of Bari and Otranto, called Puglia Petrosa, or 'Stony Apulia.' A description of these two regions is given under Capitanata, Bari (Terra di), and Otranto (Terra di). The whole of Puglia is one of the most productive countries of the kingdom; its chief wealth consists in corn, oil, wool, and cattle. In antient times this tract of country was inhabited by the Dauni, the Appuli, the Peucetii, the Calabri or Messapians, and the Salentini. [Apulia.] The Calabri occupied the northern and the Salentini the southern coast of the Iapygian peninsula. The first Norman conquerors of Naples styled themselves dukes of Apulia and Calabria, before Naples had become the capital of the whole kingdom.

PU'LCI, LUI'GI, born at Florence, in 1431, of a respectable though poor family, became early in life acquainted with the wealthy family of Medici, through which he seems to have obtained an inferior office under the Florentine republic. He travelled about Italy, and even beyond its limits, according to his own statement. Few particulars of his life are known. He married Lucrezia Albizzi, by whom he had two sons, who survived him. He was a welcome guest at the table of Lorenzo de' Medici, who relished his wit and his extempore poetical effusions. Lucrezia Tornabuoni, Lorenzo's mother, urged Pulci to write an epic poem. Pulci undertook the task, and he looked for his theme among the traditional legends of Charlemagne and his Paladins, as recorded by Turpin, which had already become familiar in Italy through the Italian romance 'I Reali di Francia,' written in the thirteenth century, and had become a popular theme for the extempore effusion of strolling story-tellers. Pulci took for the subject of his poem the treachery of Gano of Maganza, one of Charlemagne's vassals, who is reported in the old legends to have conspired with the Saracens of Spain against his master, and to have brought about the fatal defeat of the French at Roncesvalles in the Pyrenees. Pulci was well acquainted not only with Turpin's 'Chronicle,' but with the old French and Provençal romances which related to the fabulous history of Charlemagne's Spanish wars. An abstract of these singular traditions, in which the confused records of the wars of Charles Martel and his son Pepin against the Saracens in France were mixed up with the short campaign of Charlemagne himself beyond the Pyrenees, is given (by Foscolo) in No. 42 of the 'Quarterly Review,' and also in an article on the early poetry of Spain, in No. 78 of the 'Edinburgh Review.' Pulci moulded those rude materials into a living form, and breathed into it his own poetical inspiration. His predecessors had dealt out the old traditional fables in a sober serious strain. Pulci was the first to seize the ludicrous side of the stories, and to derive from it a fresh subject for poetry and a source of amusement for his readers. Still his poem is not, as it has been by many supposed to be, a burlesque poem, but a combination of the serious with the facetious; it is a romance accompanied by its own parody. The poet is often evidently in earnest, being carried along by the lofty or pathetic events which he describes; but he now and then relaxes to enjoy a laugh with his hearers at the expense of his heroes, and of the popular story-tellers, who formed a numerous tribe in his age, and who, by their pompous diction and their exaggerations and anachronisms, enhanced the absurdity of their wondrous tales. One character however, that of Orlando, the French and Spanish Roland, Pulci preserved in its original simple grandeur, as handed down by old tradition. It was reserved for Bojardo to lower the original character of the Roland of old traditional legend, the chaste and unspotted champion of religion, loyalty, and chivalry, and to reduce it to that of a brave but frail warrior. Pulci brought also on the scene another worthy competitor for fame, Rinaldo of Montalbano, the Reynault of the French romances, whose character and adventures he took chiefly from 'Les Quatre Fils d'Aymon' of Adenès, an old romance writer of the thirteenth century.

The title of 'Morgante Maggiore,' which Pulci chose to give to his poem, is a capricious one, for the giant whom he introduces by the name of Morgante is only a subordinate character, and acts as squire to Orlando. The reason of the adjunct 'Maggiore' is not perceived, unless it was given to him on account of his great strength.

Orlando is the hero of the poem, but Gano may be considered as the principal actor; like Satan in Milton, he is the author of all mischief, and his punishment is properly the end of the action. 'The Treasons of Gano' would have been a more appropriate title to the poem. Another giant, called Margutte, is the Thersites of the poem. He is an open scoffer at religion, and boasts of his numerous sins; he is, in short, an impudent but humorous villain. He accompanies Morgante, who is a pious personage, and dies at last of an immoderate fit of laughter at some ludicrous sight. This character of Margutte, which is merely episodical, and which seems to have been introduced by Pulci in a fit of unrestrained mirth, has been adduced by Voltaire and others as a proof of Pulci's unbelief. But the poet, from the beginning, proclaims Margutte to be what he is, a profligate despicable fellow, and by so doing shows no intention of recommending his opinions or example.

In canto xxv. there is a curious dialogue between Rinaldo and a familiar dæmon named Astaroth concerning the then so-called Pillars of Hercules. The dæmon says: 'An old and hallowed error has long prevailed, that no one can venture westward of this point without incurring certain death. Know then that this is a vain supposition, for it is possible to navigate far beyond, as the sea is level everywhere, although our world has a round form, as everything above is attracted to the centre, and the earth itself stands suspended among the stars. And ships shall proceed far beyond the boundaries which Hercules fixed here in times of ignorance, and they will discover another hemisphere, where are towns, nations, and empires. Those are the antipodes, and they adore the Sun and Jupiter and Mars, they have trees and cattle as you have, and often wage war against one another.' (Canto xxv., st. 228, et seq.) Pulci wrote this fifteen years at least before Columbus sailed on his memorable expedition. Rinaldo asks whether the antipodes are of Adam's race, and are capable of obtaining salvation. To this delicate question the dæmon answers, that all men may be saved by the Cross, and that the day will come when, after many errors and wanderings, all will acknowledge the truth and find acceptance. The whole passage is curious as illustrative of the state of mind among men of information in Italy in that age. Roland's last fight and dying scene at Roncesvalles are beautifully described by the poet. The farewell of Roland to his faithful steed, his trusty companion in many a battle, his confession and last prayer, and the angelic melody which is heard above, as he expired—all this part is equal in pathos and loftiness to any passage in either Dante or Tasso. The poet felt evidently interested in his subject and wrote in earnest. But even here he occasionally breaks out, in the midst of his most serious narrative, into a fit of comic humour, as if by way of relaxation. While the fearful conflict is raging in the glen of Roncesvalles, the poet descries two dæmons keeping watch in a deserted chapel on the outskirts of the defile, intent upon seizing and securing the souls of the Saracens who fell in the battle, as their lawful prey. The eagerness of these satanic sentries is described with much drollery.

It is a curious fact that the first edition of the poem of Pulci, with all its freedom of thought and expression, came out in 1481, from the press of the convent of Ripoli at Florence, and that some of the nuns, and one Marietta among them, acted as compositors, and were paid accordingly. (*Notizie Istoriche sopra la Stamperia di Ripoli*, by Father Vincenzo Fineschi, Domenicano, Florence, 17[illegible].) There was a much greater degree of freedom in speaking and writing in Italy during the fourteenth and fifteenth centuries than there has been at any time since; the change took place about the middle of the sixteenth century, when the alarm about the spreading of the doctrines of the Reformation induced Pope Paul III. to establish permanently, with the consent of Charles V., the court of the Inquisition, which effectually silenced both tongues and pens.

The 'Morgante Maggiore' is less read and noticed now even in Italy than it deserves; the poem has many beauties and great fluency and vivacity of diction, owing to the author being a Florentine and writing in his own vernacular language. Pulci may be considered both as the last of the old romancers and as the first of the Italian epic writers. His poem retains much of the simplicity and antique cast of the traditions of the dark ages, enriched with the information of a more enlightened period. By reading the 'Morgante' attentively, one is less surprised at some old Florentine critics giving it the preference over Ariosto's splendid and elaborate poem. But the two works are the representatives of two different ages, and there is the same difference between them as there was between Pulci's jovial and free-spoken friend, Lorenzo de' Medici, and the princes of the House of Este, the courtly patrons of Ariosto. The edition of the 'Morgante,' Naples, 1782, contains a good biography of the author.

Pulci wrote also a number of satirical and some licentious sonnets, and other light poetry, including his 'Confession,' the copies of which are rather scarce. Pulci died at Florence in 1487.

PULEX, the name given by Linnæus to a group of insects of which the common flea may be regarded as the type.

The fleas are considered by Latreille, Kirby, and many other entomologists, as constituting an order of insects. They form the group *Suctoria* of De Geer, the order *Siphonaptera* of Latreille and *Aphaniptera* of Kirby and Spence, by whom they are placed between the orders *Diptera* and *Aptera*. In the 'Règne Animal' they are arranged between the orders *Parasita* or *Anoplura* of Leach, and the Coleoptera. It is highly probable however that when this group is better known—when the numerous insects allied to the fleas are more common in our cabinets—it will be found that they do not constitute an order by themselves, but are aberrant forms of the other *well established orders*; in these there is a certain degree of uniformity, as regards numbers, variety of habits, &c., which can but lead us to doubt the validity of the so-called orders containing only one or two genera and but few species, such as the present order, and the orders *Aptera*, *Homaloptera*, and *Strepsiptera*. It is moreover worthy of observation that each of these so-called orders is composed of *parasitic insects*, which necessarily involves a structure very unlike the more typical species of the groups to which we may suppose they belong. Upon these grounds, the orders just mentioned, being regarded as not sufficiently worked out, are omitted in the article INSECTA.

The *Suctoria* have the mouth composed of three pieces, enclosed by two articulated laminæ, which, when united, form a cylindrical or conical proboscis, the base of which is protected by two scales. They undergo a complete metamorphosis: the larva is of an elongated cylindrical form, and when about to change into the pupa state, encloses itself in a silken cocoon, and at the end of a few days assumes the imago or perfect state.

In the genus *Pulex* the body is compressed, of an oval form, and protected by a tough coriaceous covering. The head is small and much compressed, and furnished on each side with a small round eye; behind this is a concavity in which the antennæ (which are three-jointed) are situated.

On the anterior part of the head are two four-jointed organs, supposed by Latreille to be the antennæ, but which must be palpi, the organs situated behind the eyes being now supposed to be the antennæ. The legs are large and strong, particularly the hinder pair, by which the insect jumps, and covered with spines; the tarsi are five-jointed, and the terminal joint is furnished with two elongated claws; the anterior pair of legs are inserted almost under the head, and the rostrum lies between them.

The female flea is said to lay about a dozen eggs, which are of a whitish colour and somewhat viscid: the larvæ are long and slender, and have no legs; the head is scaly and has no eyes, but is furnished with two very small antennæ: each of the segments of the body is provided with little tufts of hair, and the terminal segment has moreover two hooked appendages at its apex.

The common flea (*Pulex irritans*) is but too well known. It is said to attack dogs, cats, and other animals, as well as man; but there are other species which appear to be peculiar to certain birds and quadrupeds, and these have received in most cases the names of the species they attack, such as the dog flea (*Pulex Canis*), the mole flea (*P. Talpæ*), that of the martin (*P. hirundinis*), and of the mouse (*P. musculi*), &c.

The Chigoe of the West Indies and South America also belongs to this group, being the *Pulex penetrans* of authors. 'It is described,' say Messrs. Kirby and Spence (vol. i., p. 1[illegible]), 'as generally attacking the feet and legs, getting, without being felt, between the skin and the flesh, usually under the nails of the toes, where it nidificates and lays its eggs; and if timely attention be not paid to it, which, as it occasions no other uneasiness than itching (the sensation at first, I am assured, is rather pleasing than otherwise), is sometimes neglected, it multiplies in such a degree as to be attended by the most fatal consequences, often rendering amputation necessary, and sometimes causing death. The female slaves in the West Indies are frequently employed to extract these pests, which they do with uncommon dexterity.' Besides the name Chigoe, they are sometimes called *Jiggers*, *Nigua*, *Tungua*, *Pique*, &c.

For further information respecting this group of insects the reader is referred to M. Dugès's 'Recherches sur les Caractères Zoologiques du genre Pulex,' published in the '*Annales des Sciences Naturelles*' for October, 1832. Mr. Westwood has also published a paper 'On the Structure of the Antennæ of the order *Aphaniptera*,' &c., in the '*Entomological Magazine*,' vol. i., p. 520.

PULGAR, HERNANDO DEL, a celebrated Spanish historian, was probably born at Pulgar, a village near to Toledo, about 1436. When still young he entered the household of John II., king of Castile, and was admitted as one of his pages. After the death of that monarch, Pulgar was appointed secretary to Henry IV., his son and successor, by whom he was entrusted with various confidential affairs. He retained his place on the accession of Isabella, who, in 1482, raised him to the vacant office of national historiographer. From that period Pulgar remained near the royal person, accompanying the queen in her various progresses through the kingdom, as well as in her military expeditions into the Moorish territory. He was consequently an eye-witness of many of the warlike scenes which he describes, and from his situation at the court must have had access to the most ample and authentic sources of information. That portion of his Chronicle containing a retrospective survey of events previous to 1482, may be charged with gross inaccuracy; but this cannot be said of the remaining part, which may be received as perfectly authentic, and has all the character of impartiality. Pulgar's style of narration, though rather too prolix, is sufficiently perspicuous, and may be favourably contrasted with that of contemporary writers. His Chronicle was first printed at Valladolid, in 1565, when it appeared under the name of Antonio de Lebrixa, among whose papers it was found by his grandson the editor. Two years later (1567), another edition was published at Saragossa, with the real name of the author. The last and most elegant edition of Pulgar's Chronicle was printed at Valencia, in 1780, by Benito Montfort, in large folio.

Pulgar left some other works, of which his Commentary on the 'Coplas de Mingo Revulgo,' an antient satire, in the form of a dialogue between two shepherds, describing the court of John II., his 'Letters,' and his 'Claros Varones,' or sketches of illustrious men, have alone been published. The last contains forty-six biographical articles of the most distinguished individuals of the court of Henry IV., which, although too indiscriminately encomiastic, contain much valuable information on the principal actors of that period. Fourteen of the Letters were first printed at Seville, towards the close of the fifteenth century; the whole number—thirty-two—were afterwards printed at the same city, together with the 'Claros Varones,' 1500, 4to. Several editions of the same two works were subsequently published, Alcalá, 1524 and 1528; Zamora, 1543; Valladolid, 1545; Antwerp, 1632; all in 4to. The Letters only were afterwards translated into Latin by Julian Magon, and published with the Spanish text, at the end of Peter Martyr's 'Epistles,' Amstelodami, apud Elz., 1670. There are also three modern editions, Mad., 1747, 1775, and 1789, 4to. The two last are valuable on account of some excellent notes and their having a biographical account of Pulgar prefixed to them.

Nicolas Antonio (*Bib. Nov.*, vol. ii., p. 388), attributes to him a Chronicle of Henry IV., and a history of the Moorish kings of Granada. Other bibliographers have confounded this Pulgar with Hernan Perez del Pulgar, a distinguished officer, who gained great renown in the war of Granada, and who is supposed to be the author of a Chronicle of Gonzalo de Cordova, Alcalá, 1584, fol., as well as of a translation of a French historical work, entitled 'La Mer des Histoires,' which appeared at Valladolid, in 1512, fol., under the title of 'Mar de Historias.'

The year of Pulgar's death has not been ascertained: it is probable that he did not survive the capture of Granada by Ferdinand and Isabella, as his history falls somewhat short of that event, and we cannot suppose that he would have failed to commemorate the most important occurrence in the reign of his royal masters. Besides, from some remarks in his Letters, all of which were written after 1480, it would appear that he was already at that time much advanced in years. It is however quite clear that Pulgar was still living some years after 1486, the epoch which the 'Biographie Universelle' has erroneously assigned for his death. (Nicolas Antonio, *Bib. Nov.*, vol. ii., p. 397.)

PULLEY. The pulley is one of the simple machines or mechanical powers employed in the construction of machinery and in the transmission and modification of force. The kinds of pulley in use are very numerous; but they all consist of combinations of a grooved wheel, moveable on an axis, and a rope lying in the groove; and the manner in which this rope passes over and under a system of these wheels, so as to connect the force with the resistance, or the power with the weight, determines the species or kind of pulley. But whatever the mechanical arrangement of the wheels and of the rope, the principle of all pulleys is the same, namely, the transmission of the tension of a rope, without sensible diminution, so as to obviate the loss of force consequent on rigidity. If a rope possessed perfect flexibility, any system of fixed points, as a series of nails, over which the rope might be bent, would answer the same end mechanically as a system of pulleys; but it is known that if a rope be bent over a sharp edge, little force will be transmitted beyond that point, as the daily experience of sustaining a very heavy weight attached to one end of a rope by a very small power at the other end, provided the rope be bent over several small edges, shows.

The principle of pulleys is the application of the theoretical principle of the transmission of the force of tension, and the following are the mechanical combinations by which it is usually put in practice:—

The single fixed pulley is a wheel with a groove on its circumference, and fixed in a case or *sheave* (as it is technically termed) to prevent the rope slipping from off its surface as it is moved round by the friction of the rope. The force is not modified in amount by this machine, but only in direction; that is, the power and the weight equal each other.

The single moveable pulley consists of one wheel fixed and the other moveable; the power acts at one end of the rope, and the other end is fixed to an immoveable obstacle; the weight or resistance is attached to the sheave of the moveable wheel. In this the power is one half the resistance when there is equilibrium. The pulley is sometimes called a *runner* by practical men.

The Spanish barton consists of two moveable wheels and one fixed wheel; and there are other arrangements, by which two fixed wheels and one moveable wheel are employed.

The first system of pulleys consists of an upper and lower set of wheels, called the upper and lower block; the upper being fixed, and the lower, to which the resistance or weight is attached, being moveable. The power is to the weight or resistance as unity to the number of wheels in the lower block.

Smeaton's tack, so called after the celebrated engineer of that name, contains two tiers of wheels, one above the other, in each block. The course of the rope is so arranged that the power and the weight act over the centre of the upper and lower block, and there is consequently no tendency in the system to twist, but the upper and lower block each preserves its horizontal position. This highly ingenious arrangement is open however to other serious objections, as great friction and unequal wear for the different velocities with which the wheels move. These practical difficulties are in a great measure obviated in the following system.

White's Pulley. The wheels in each block, the upper and lower block, turn on the same axis, and have different diameters, and are so proportioned that the circumferences have a velocity equal to that of the rope which passes over them. It is found on calculation that the several wheels in the upper block will revolve in the same time, if their circumferences are as the numbers 1, 3, 5, &c., and that the several wheels in the lower block will revolve in the same time, if their circumferences are as 2, 4, 6, &c. The diameters of the wheels consequently have this proportion. The lateral friction, however, of a number of independent wheels is great; and this is obviated by having the upper and lower block cut in grooves according to the above rule, so that all the friction is reduced to that of the pivots and the lateral friction of one wheel.

Second system. In the combinations previously described only one rope is employed, and the upper block is fixed and the lower block moveable. But in this system there are several ropes; the upper block consists of a single wheel, which is fixed, and the lower block of several moveable pulleys; the string of each being attached to the sheave of the moveable pulley above it, and to an immoveable obstacle. Each additional rope or moveable pulley in this system doubles the effect of the power, but it is not a system of any practical use.

Third system. In this the wheels of the upper block are moveable pulleys, with the exception of the upper wheel, which is fixed, and there are several strings, each attached to the weight. This is the most powerful system in respect of the ratio of the power and weight, but useless in practice.

The various systems of pulleys present the best practical illustration of the great mechanical principle of virtual velocities [VIRTUAL VELOCITY], or, as it is expressed by practical men, that whatever is gained in force is lost in velocity. The power of a weight or of an agent in practical mechanics is estimated by the product of the force exerted and of the space through which it is exerted; in all the preceding systems it will be found that the product of the power and of the space through which it has moved is equal to the product of the weight and of the space through which it has moved; and the principle of virtual velocities may be easily verified.

PULMOBRANCHIA'TA, M. de Blainville's name for his first order of his second subclass (*Paracephalophora Monoica*) of his *Malacozoa*, and thus defined by him:—

Organs of respiration retiform or aërian, carpeting the *plafond* of the cavity situated obliquely from left to right upon the origin of the back of the animal, and communicating with the ambient fluid by a rounded orifice, pierced on the right side of the swollen border of the mantle. All these animals, according to M. de Blainville, are more or less disposed to breathe air. The greater part are terrestrial, some live on the banks of fresh waters and sometimes on the sea-banks. None of them bury themselves in the mud or sand of the bottom, excepting the *Limnacea*, during the rigorous season. All are phytiphagous, and are known in almost all parts of the earth.

The following families and genera are arranged by M. de Blainville under this order:—

Fam. 1. Limnacea.

Genera:—*Limnæa, Physa, Planorbis.*

Fam. 2. Auriculacea.

Genera:—*Pedipes, Auricula, Pyramidella.*

Fam. 6. Limacinea.

Genera:—*Succinea, Bulimus, Achatina, Clausilia, Pu..., Tomogeres, Helix, Helicolimax, Testacella, Parmac..., Limacella, Limax, Onchidium.*

Cuvier had previously named his first order of Gastrop... *Pulmonés*, describing them as distinguished from o... mollusks by their breathing the elastic air through a h... under the border of their mantle, and which they dilate ... contract at their pleasure. They have, he adds, no branch... but only a network of pulmonary vessels which creep up... the walls, and principally upon the *plafond* of their res...tory cavity.

Some, he observes, are terrestrial. Others live in t... water, but are obliged to come from time to time to the s...face, in order to open their pectoral cavity for respira... He divides them into the following sections:—

1. Pulmonés Terrestres.

(Almost all four tentacles.)

Genera:—*Limax, Vaginulus, Testacella, Parma..., Helix, Vitrina* (*Helicolimax*, Fér.), *Bulimus, Pupa, Ch...drus, Succinea, Clausilia, Achatina.*

2. Pulmonés Aquatiques.

(Two tentacles only.)

These, according to Cuvier, always come to the surf... of the water to respire, so that they cannot inhabit d... waters: they live for the most part in fresh waters or ... lakes, or at least near the coasts and mouths of rivers.

Genera:—*Onchidium* (without a shell), *Planorbis, L...næa, Physa, Scarabus, Auricula, Melampus* (*Conov...* Lam.).

Most of these forms have been treated of in this work

PULMO'GRADA. The genus *Medusa* of Linnæus w... placed by him in the second section of his *Vermes*, ... *Mollusca*. The *Mollusca* were divided into six sections in t... 'Systema Naturæ;' and in the last of these, consisting ... those molluscous forms which had a central mouth bel... *Medusa* stood as the first genus, followed by *Asterias* ... *Echinus*. The third section of *Vermes* (*Testacea*), w... *Chiton* at its head, immediately followed. In this arran...ment *Medusa* came between *Nereis* and *Asterias*; but ... the body of the work it stands between *Sepia* and *Aster...*

The following is the Linnean definition of the ge... *Medusa*:—

Body gelatinous, orbiculate, depressed. *Mouth* bene... central.

The genus contained twelve species, and these cons... not only of true *Medusæ*, but of *Cirrhigrada*, as *P...* and *Velella*. [CIRRHIGRADA.]

the *Zoophytes* of Cuvier (his third class of *Zoophytes*) comprehends, to use his own terms, Zoophytes which swim in the sea and in whose organization may be perceived vessels which in truth are most frequently nothing but prolongations of the intestines hollowed in the parenchyma of the body.

Cuvier's first order of these *Acalephans*, or *Sea-nettles*, consists of the *Simple Acalephans*, which he characterizes as floating and swimming in the sea by means of the contractions and dilatations of their body, their substance being gelatinous, without apparent fibres. The sort of vessels which are seen in some are hollowed in the gelatinous substance; they often visibly come from the stomach, and do not give place to a true circulation.

The genera contained in this order are the great genus *Medusa*, Linn., with its subgenera *Porpita* and *Velella*.

The great genus *Medusa* is characterized as having a disk more or less convex above, similar to that of a mushroom, and called the *umbrella*. Its contractions and dilatations assist in the motility of the animal. The edges of this umbrella, as well as the mouth, or the suckers, more or less prolonged into pedicles which take its place, in the middle of the lower surface, are furnished with tentacles of very different form and size. These different degrees of complication have given rise to very numerous divisions. For these we refer the reader to the 'Règne Animal.'

The *Arachnodermata* form the second class of M. de Blainville's *Actinozoaria*. He observes that this class corresponds exactly to the genus *Medusa* of Linnæus.

The following is M. de Blainville's definition of this group:—

Body free, regularly oval or circular, subgelatinous, covered with an extremely fine skin, which is but little or not at all distinct, sustained or not by a solid subcartilaginous part, and provided with very diversiform radiated appendages.

Intestinal canal limited to the stomach and provided with a single orifice.

Ovaries multiplied, radiated, and opening in the interior of the stomach.

M. de Blainville goes on to state that their form, which is regular, is nearly always circular (the *Velellæ* alone being oval), sometimes discoid or spheroidal, but most frequently hemispherical, which causes them to resemble our umbrellas, and has given rise to the distinction of their body by that name. This body is sometimes furnished in addition in its circumference with more or less long cirrhi, to which the name of tentacles, or better, of tentaculiform cirrhi, has been given.

The lower surface of the umbrella, he observes, is sometimes entirely naked, but in other cases is provided with numerous and dispersed tentaculiform suckers, as in the *Porpitæ* and *Velellæ*, or else with very diversiform appendages, capillaceous at least at their extremity, which zoologists have termed arms, whence the denomination of *Brachiodaceæ* which they have given to some species. These appendages in some are sometimes free from their base but in other cases are united, which unity produces a sort of peduncle, which has originated the designation of *Pedunculated* for those species that are so provided. In the middle of the lower surface of the umbrella of these *Medusæ* is sometimes a species of peduncle formed by a proboscidiform prolongation of the buccal orifice, and they are then called *Proboscideæ*; but in the greater number of cases, the middle of the lower part of the umbrella is occupied by a mass of less considerable mass, attaching itself to the body by four arms, in the form of a cross, so as to divide the buccal orifice into four semilunar parts. This peduncle, terminated by more or less numerous capillaceous divisions, has caused the name of *Pedunculated* or *Polystomatous* to be applied to those *Medusæ* which are provided with it.

The *Arachnodermata*, according to the same author, are all marine animals. They are found in all seas, often in considerable masses, but especially in the seas of warm countries, sometimes, it is said, in sufficient quantity to stop the progress of vessels which traverse the enormous shoals which they form. Although they are all free in the fluid, where they live at various depths, they are constantly in a reversed position, like the *Echini*. Their locomotive power is not being sufficient to resist the currents of the seas in which they inhabit, it consists of an isochronous movement of systole and diastole, which is continued, without interruption, to the termination of life, and in a more voluntary contraction of the borders of the umbrella.

M. de Blainville further states that he would willingly suppose that these animals are not born with the same degree of development which they afterwards attain; but he adds that he has no positive fact which supports this hypothesis. Pallas however, he observes, says that *Rhizostoma Cuvieri*, so common on our coasts, has much less complicated appendages in its youth. (See p. 121.)

M. de Blainville acknowledges that he knows nothing positive of the duration of life of these animals; he only knows that certain *Rhizostomata* acquire a considerable development, so as to reach nearly a foot and a half in diameter, and a total length of two feet at least; but, he adds, it would seem that the number of species which are nearly microscopic is relatively the greatest; and he refers to Scoresby, who in his observations on the zoology of the arctic regions has furnished curious details on this subject.

The first subdivision of the *Arachnodermata* established by M. de Blainville depends on the presence or absence of a solid piece for the support of the umbrella or body of the animal, and consists of the *Cirrhigrada*, which are provided with that support, and of the *Pulmograda*, which are without any such support. These orders, observes M. de Blainville, are further distinguished by the very different nature of the appendages with which the umbrella is furnished on the inferior surface.

Of the *Cirrhigrada* we have already treated [Cirrhigrada]; we now have to turn our attention to the much more considerable order of the *Pulmograda*, or *Medusariæ*.

Organization.

The difficulty of examining the *Pulmograda* is, from the very nature of their texture, considerable; and that of preserving them in spirit great. It is not then to be wondered at that a great portion of their organization remained for a long time in obscurity, and that much relating to it still remains to be cleared up. To observe them with anything like a satisfactory result, they must be studied on the spot, and while they are alive; and thus it is that several points relative to their organization and habits, and their generation especially, have lately been cleared up. The possibility of fairly preserving them in spirit is shown in the museum of the Royal College of Surgeons in London, where, in the department comprehending the first division of the Preparations of Nat. Hist. in spirit, several of the Acalephans (No. 64 to 72 A, both inclusive) are to be seen so preserved. Of the *Pulmograda*, or *Medusariæ*, there are eight specimens (No. 66 to No. 72 A, both inclusive).

The disk presents a uniform cellular appearance internally, and the cellular substance is very soft. In its mass no fibre has hitherto, we believe, been traced, and indeed the quantity of solid matter in the whole animal must be very small. Those who have taken *Medusæ* out of the sea and laid them upon a dry board or dry stone must have observed how soon they sink into a sort of deliquescence. Spallanzani came to the conclusion that the sea water penetrating the organic texture constitutes the greater part of the volume in the *Medusæ*, some of which when newly taken out of the sea weighed 50 ounces, though their dried remains gave a weight of little more than 5 or 6 grains. A fine muscular membrane appearing, when examined with a magnifying glass, to be composed of numerous fleshy fibres disposed in small bundles radiating as regards the axis of the *Medusa*, and adhering closely to the gelatinous substance of the disk, may be seen in some species stretching over a given extent of the lower surface of the umbrella, a little within its outer margin. Portions of the disk, or umbrella, have been cut from these animals whilst they were alive; those portions which had no part of this muscular membrane attached to them exhibited no signs of motion; in those, on the other hand, whose connection with the muscular membrane was preserved, the reciprocal contraction and dilatation were continued for some time. Those *Pulmograda* which have cilia around their margins have also circular vessels running along their bases, and most of the projectile and extensile tentacles and filaments have sacs and canals with contained fluids at their roots. If these cilia may be regarded, and they doubtless may be, as one of the causes, and a principal one, of locomotion, the pensile tentacles of the *Medusæ* may be viewed as auxiliary at least to that faculty, though they probably are principally employed as nutrient organs. They are hollow and simple, and appear to increase in their extensibility in proportion to their connection with the appendages of the digestive cavities, or when furnished with a vesicle at their base. Suckers are found at the extremities and along the sides of these tentacles in several of the genera, so as to enable them more securely to catch the floating destined prey, or to assist in anchoring the Medusa when it would rest, as we have reason to believe it occasionally does. Eschscholtz was convinced that what Péron took for internal air-bladders were only appendages to the gastric cavities, into which air had been introduced by accident upon removing the animals from the sea.

Nervous System and Senses.—We are not aware of any quite satisfactory demonstration of a nervous system in the Acalephans. Dr. Grant indeed (*Zool. Trans.*, vol. i.) notices a structure in *Cydippe* which in his opinion can only belong to that system; but Eschscholtz, whose labours in investigating the organization of this class were not small, failed to discover nerves in the largest which he examined. That they enjoy ***sight*** has been a question. Ehrenberg has endeavoured to show that *Medusa aurita* possesses eyes in the form of small red points visible on the surface of the eight brown masses which are round the circumference of the umbrella; and he has compared these so-called eyes to those of certain *Rotifera* and *Entomostraca*. He considers the glandular body at the base of the pedicle to be an optic ganglion, and notices its connection with two filaments that decussate about the middle of their course; and he views these as constituting part of a nervous circle situated, for the greater part of its extent, directly along the bases of the row of tentacles surrounding the umbrella, and so forming a sort of outer wall of the circular vessel or appendage of the intestinal cavity which runs round the margin of the umbrella. He also describes another nervous circle, formed of four ganglion-like masses. These he states to be disposed round the mouth, and to be each connected with a corresponding group of tentacles.

But the general opinion seems to be that ***touch*** is the only sense possessed by the Acalephans, as far as proof has hitherto gone. That they are sensible to light, though the evidence in favour of their possessing sight properly so called may not be deemed conclusive, will be generally admitted. It is said that some of the smaller tribes have been known to shun a bright light, and to sink into deep water to avoid it. We remember to have seen off Seaton in a calm a shoal of the great Rhizostoma of our coasts swimming high with the tide: as they neared our boat, over whose side we were looking, they gradually sank in the clear glassy sea; and it required some dexterity to catch even one or two of the great numbers that passed with the boat-hook, the only engine we had for their capture. The least motion seemed to alarm them. We have observed a similar care in avoiding strange objects, when watching the shoals of a smaller species of *Medusæ* coming up with the tide in the river Hamble in Hampshire, which is also very clear on the flood-tide when the rains have not been heavy.

The chief seat of the touch appears to be in the tentacula and cirrhi with which the majority of Pulmograda are furnished. Many of them, as we have ourselves observed, make no sign when wounded extensively in the umbrella or disk. That their irritability is not small, is however shown by the experiments of Spallanzani, who, by friction of the muscular membrane of the umbrella and pricking it, excited the contracting and dilating motions in *Medusæ* which had been deposited in a dry place for four and twenty hours, had entirely ceased to exert their ordinary movements, and had lost two-thirds of their bulk or nearly so by the draining out of their contained fluids.

Food and Digestion.—The food, small fishes and marine animals, both living and dead, is probably conveyed to the mouth not only by the tentacles and cirrhi with which the greater part of the *Medusæ* are furnished, but also by contractions in the umbrella or disk itself. This must, one should think, be the case in those genera, *Eudora* for instance, which are without tentacles. The mode of taking the prey does not however seem to be accurately known. Botta's observations were confined to the digestion of a small fish by a *Medusa*, but he did not see the *Medusa* catch it. Fishes of some size have been found dead and entangled in the tentacles of *Medusæ*, killed most probably by that benumbing or stinging quality which has obtained for them the name of *Sea-Nettles*.

By the investigations of M. Milne Edwards principally, we now know that all the *Pulmograda* have gastric cavities, but all have not mouths in the ordinary acceptation of the word. In *Rhizostoma*, for instance, the only communication between the stomach and the outer surface is carried on through numerous branching canals in the pensile arms. The orifices by which these open externally are very minute; so small indeed, even where the species is large, as barely to admit *Entomostraca* of a very small size. In *Charybdæa*, which was believed to be agastric, M. Milne Edwards has shown that a mouth and an internal cavity with which that mouth is connected actually exist. The projection of extremely delicate tissues hanging from the roof, so to speak, of the funnel-shaped cavity of *Charybdæa* surrounded a central mouth and a stomach, from which proceeded four long canals leading to the tapering filaments pendent from the margin of the animal's body, and these canals he believes to bear analogy to the radiating vessels in Rhizostoma. There is a group of small cylindrical sacs at the beginning of each canal and opening into it, which, he thinks, may be regarded as biliary organs. The experiments of Spallanzani, which were principally made on *Aurelia phosphorea*, Lam. (*Pelagia*, Esch.), showed him four groups of convoluted membranous tubes, which resembled in structure the intestines of the *Vertebrata*, and though he did not trace their connections, he seems to have viewed them as true parts of the alimentary canal. They exhibited a peristaltic motion both when in the water and out of it, and this motion could be increased by stimulus. Professor Owen suggests that these must have been the ciliated and plicated tube-like *testes*, or *ovaria*, according to the sex of the individuals examined.

A good deal of obscurity still hangs over the ***Respiration*** and *Circulation* of the *Pulmograda*; but we cannot forbear to call attention to two most striking and beautiful examples of the anatomical skill of John Hunter, which may help the observer in his inquiry as to how these animals breathe. In the *Physiological Series of Comparative Anatomy* in the museum, the foundation of which was laid by him, will be found the following preparations (*Series I. Aeration of the blood by means of gills*):—No. 982. A Medusa (*Rhizostoma cærulea*, Cuv.) injected, with a portion of the disk removed so as to expose the central cavity or stomach, and the common orifice by which the numerous nutritive canals of the ramified processes pour their contents into that cavity. The vessels which proceed from it to ramify and subdivide, so as to form the respiratory network in the margin of the disk, are successfully injected. No. 983 shows a portion of the margin of the same specimen. The colour of the vermilion, which some chemical change has destroyed in the preceding preparation, is here preserved. The vascular network is seen to be formed by the lateral ramifications of straight vessels diverging to the circumference of the disk, and placed about an inch apart from each other. The vessels at the central margin of the network are the largest, and encroach in a semicircular form upon the intervals of the straight vessels, before these begin to distribute their lateral branches. The peripheral or terminal vessel of the network is very minute, and follows the scolloped contour of the margin of the disk. The whole of this vascular network is placed on the surface of the disk, which, in the natural position of the animal, rests upon the water; and thus this simple but beautiful respiratory apparatus is most effectually brought in contact with that element, through the medium of which the circulating fluids of the Medusa are submitted to the influence of the atmosphere. (*Cat. Mus. Coll. Chir.*, vol. ii.)

Till lately nothing comparatively was known of the *Generation* of this curious tribe. Gaede, Müller, Eschscholtz, Milne Edwards, Ehrenberg, Jæger, Siebold, and Wagner have all thrown light upon the subject, but the last has satisfactorily proved that some of the *Pulmograda* at least are diœcious; that they are in fact male and female; and that the organs of the male are in August crowded with *spermatozoa* aggregated in minute spiriform groups. No copulation has been observed, and the probability is that the male influence is conveyed by dispersion through the ambient medium. The *ova* are excluded by compression of the sac, and Siebold has traced their stages with as great exactness as has been employed in tracing those of any other animal. Not the least curious part of the generative system and economy of the Pulmogrades is the marsupial apparatus in certain species, as the *Medusa* (*Cyanæa*) *aurita*. This consists of a series of small flask-shaped processes developed from each side of the oral tentacles, where the ovaria are crowded with the impregnated ova, and by a transition, of which the nature is as yet as problematical as the passage of the embryo into the pouch of the Marsupialia, the ciliated ova, or gemmules, of the Medusa are transferred from the ovaria to the brachial marsupial sacs, and there undergo their development. The young Medusæ quit the marsupial pouches in the form of certain ciliated Infusoria, and afterwards assume the form of an eight-armed Polype, before their final metamorphosis, which would seem to take place in the month of February or early in March. The marsupial sacs are deciduous, and disappear soon after the escape of the young.

In the preparation No. 223c, in the Museum of the Royal College of Surgeons, is shown a Medusa (*Cyanæa aurita*, Cuv.). The four circular opaque white bodies in the substance of the disk, and seen in the interspaces of the oral tentacula, are the *gemmaria*, or organs in which the reproductive ciliated gemmules are developed; each gemmary opens by a separate ciliated orifice in the ventral or inferior surface of the body. (*Cat. Mus. Coll. Chir.*, vol. iv.)

Some idea of the swarms of *Medusæ* which are occasionally met with may be formed from the note appended to the account of the small luminous *Medusæ* brought from the Red Sea, and preserved in the Museum of the College of Surgeons (*Preparations of Nat. Hist. in Spirit*, No. 14 A). Henry Salt, Esq., was the donor, in 1811, and the note states that they were in such profusion, that the proportion of *Medusæ* to the water was fully one-third, perhaps nearly one-half. They were luminous only when alive.

Arrangement.

From the causes above noticed, when observing on the difficulty of satisfactorily examining and preserving the *Pulmograda*, the distinction of species becomes no easy task; and there is yet another reason, namely, the probability that in most of them the young after its exclusion from the ovarial sac undergoes a series of metamorphoses before it attains its full development, as it certainly does in some.

The names of Péron and Lesueur stand prominent as those of zoologists who have grappled with this obscure branch of natural history; but, as Cuvier observes, in their 'Prodromus' genera often occur which they have established on the authority of the bad figures of inaccurate authors, such as Baster and Borlase, and without having themselves seen the subjects; and from the same cause they have beyond measure multiplied the species. Still their arrangement should be that principally consulted by the student.

The method of Eschscholtz, who paid attention to a consideration hitherto comparatively disregarded, namely, the ramifications of the digestive canal, contains several new genera, which are disposed in a manner entirely different from the arrangement of Péron and Lesueur. The following table will exhibit his systematic distribution of the *Medusæ*:—

DISCOPHORÆ.

Section I.

Phanerocarpæ.

(Ovaries visible.)

Family 1.

Rhizostomidæ.

Genera: *Cassiopea*, *Rhizostoma*, *Cephea*.

Family 2.

Medusidæ.

Genera: *Sthenonia*, *Medusa*, *Cyanæa*, *Pelagia*, *Chrysaora*, *Ephyra*.

Section II.

Cryptocarpæ.

(Ovaries concealed.)

Family 3.

Geryonidæ.

Genera: *Geryonia*, *Dianæa*, *Linuche*, *Saphenia*, *Eirene*, *Lymnorea*.

Family 4.

Oceanidæ.

Genera: *Oceania*, *Callirhoe*, *Thaumantias*, *Tima*, *Cytæis*, *Melicertum*, *Phorcynia*.

Family 5.

Æquoridæ.

Genera: *Æquorea*, *Mesonema*, *Ægina*, *Cunina*, *Eurybia*, *Polyxenia*.

Family 6.

Beroenidæ.

Genera: *Eudora*, *Berenice*.

Fusing these two systems, or at least by interpolating among the genera of Péron and Lesueur, the existence of which he is far from guaranteeing, those of Eschscholtz, M. de Blainville presents the following synoptic table:—

ARACHNODERMATA, OR MEDUSARIA.

Section I.

Simple.

Genera: *Eudora*, *Ephyra*, *Phorcynia*, *Eulymene*, *Charybdea*.

Section II.

Tentaculated.

Genera: *Berenice*, *Æquorea*, *Mesonema*, *Polyxenia*, *Ægina*, *Cunina*, *Foveolia*, *Eurybia*, *Pegasia*, *Obelia*.

Section III.

Subproboscidian.

Genera: *Oceania*, *Aglaura*, *Melicertum*, *Cytæis*, *Thaumantias*, *Tima*, *Campanella*.

Section IV.

Proboscidian.

Genera: *Orythia*, *Geryonia*, *Saphenia*, *Dianæa*, *Linuche*, *Favonia*, *Lymnorea*, *Sthenonia*.

Section V.

Brachidian and Pedunculated.

Genera: *Ocyroe*, *Cassiopea*, *Aurelia*, *Melitea*, *Evagora*, *Cephea*, *Rhizostoma*, *Chrysaora*, *Pelagia*.

We now proceed to lay before the reader examples of these several sections.

Section I.

Eudora.

Generic Character.—Body very much depressed, discoid, simple, without tentacular cirrhi, without either peduncles or appendages, and offering within only ramified canals opening (abdominant) by four large trunks, in the form of a cross, into a small central cavity without external aperture.

Example, *Eudora undulosa* (Pér. and Les.).

Eudora undulosa.

a, view of the upper side; b, in profile, or with the edge of the disk towards the spectator; c, view of the lower side.

M. de Blainville remarks that he only knows this genus from the characteristic and short description given by Péron and Lesueur. He doubts whether this *Medusa* has not a mouth; for he thinks that the centre of the reunion of the four large trunks of the canals ought to be regarded as a stomach. He further inquires whether the individual figured was complete. He says that M. Lesueur informed him that there was a membrane on the lower surface, and he inquires whether this was not perhaps some remains of the stomachal cavity.

Cuvier united this genus with the *Geryoniæ*. Eschscholtz places it, as we have seen, in his family *Berenicidæ*, and unites *Euryale* with it.

Charybdæa.

Generic Character.—Body hemispherical, subconical, or even semi-elliptical, furnished on its circumference with foliaceous subtentacular lobes, hollowed below by a great stomachal excavation with an aperture as large as itself.

Example, *Charybdæa periphylla* (Pér. and Les.).

Charybdæa periphylla.

Section II.

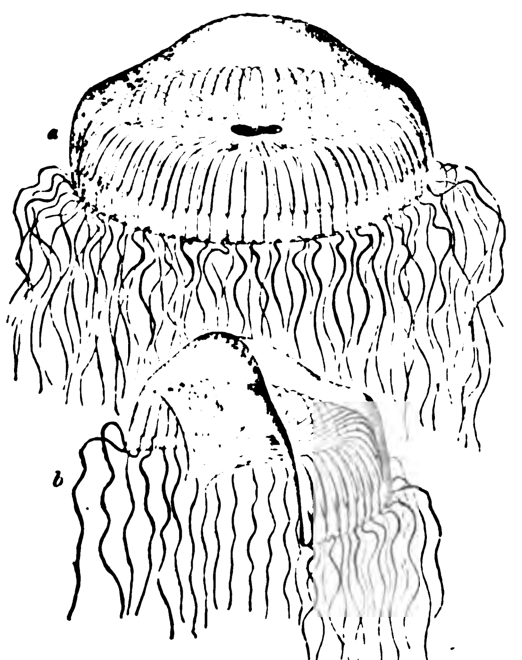
Æquorea.

Generic Character.—*Body* slightly diversiform, furnished at its circumference with a circle of filamentous tentacular cirrhi, often very long, and more or less numerous, a good deal excavated below, with a median orifice often at the extremity of a sort of circular lip, which is more or less projecting or provided with tentacular fringes.

Stomachal appendages linear, numerous, or sacciform and not numerous.

Example, *Æquorea cyanea* (Pér. and Les.).

Habitat.—South Seas.



Æquorea cyanea.

a, the animal complete; b, a portion thereof.

M. de Blainville divides this genus into the following sections:—

*

Marginal cirrhi very numerous; stomachal appendages equally numerous and linear.

A. Lip simple.

Genus Æquorea.

B.

Lip fringed.

Genus Mesonema. (Esch.)

**

Marginal cirrhi as well as the stomachal appendages sufficiently numerous, or not numerous.

C.

Cirrhi sufficiently numerous, originating opposite to the triangular stomachal appendages.

Genus Polyxena. (Esch.)

D.

Cirrhi and sacciform stomachal appendages few.

Genus Ægina. (Esch.)

We have selected a genus of the first subdivision for illustration.

Section III.

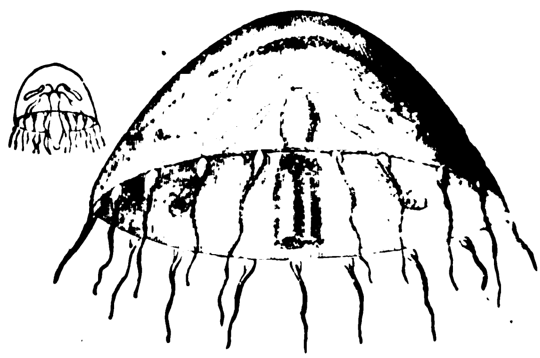
Thaumantias.

Generic Character.—*Body* hemispherical, provided at its circumference with tentaculiform cirrhi which are bulbous at the root; very much excavated beneath, and having in its middle a free pedunculiform stomachal cavity dividing itself into cláviform canals and terminated by a simple buccal orifice.

Example, *Thaumantias cymbaloïdea* (*Med. cym.*, Slabber.; *Dianæa cymb.*, Lam.).

Placed by Péron among his *Occaniæ*.

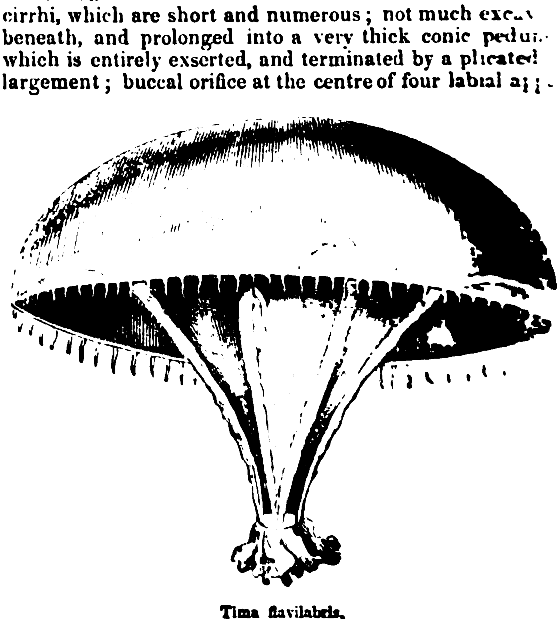
Habitat.—Coasts of Europe; Holland.



Thaumantias cymbaloidea.

Tima.

Generic Character.—*Body* hemispherical, depressed, furnished on its circumference with a circle of tentacular cirrhi, which are short and numerous; not much excavated beneath, and prolonged into a very thick conic peduncle, which is entirely exserted, and terminated by a plicated enlargement; buccal orifice at the centre of four labial appendages



Tima flavilabris.

[illegible] in the enlargement of the peduncle [illegible] in four remaining canals still communicating with a marginal canal.

Example, [illegible].

Habitat.—The [illegible].

Section IV.

Dianæa. (Quoy and Gaim.)

Generic Character.—Body hemispherical, furnished on its circumference with a small number of tentaculiform cirrhi; excavated beneath, and provided at its middle with a strong conical proboscidiform appendage, with four [illegible] appendages at its extremity.

Dianæa.

Favonia.

Generic Character.—*Body* subhemispherical, with neither cirrhi nor tentaculiform marginal cilia; rather deeply excavated beneath, with a long, median, proboscidiform prolongation, having at its root six or eight brachidiform appendages furnished with radiciform suckers. Four ovaries.

Example, *Favonia Octonema* (*Orithyia Octonema*, Less.).

Habitat.—South Seas.

Favonia Octonema.

Lymnorea.

Generic Character.—*Body* subhemispherical, furnished on its circumference with very fine, short, and numerous tentacular cilia; rather deeply excavated beneath, and provided with a long proboscidiform prolongation, having at its base eight bifid and finely divided appendages. Four ovaries in the form of a cross.

Example, *Lymnorea triedra* (*Geryonia triedra*, Lam.).

Habitat.—South Seas.

Lymnorea triedra.

a, the disk seen from above.

Section V.

Pelagia.

Generic Character.—*Body* subhemispherical, lobated, papillated, furnished on its circumference with a few tentaculiform cirrhi; eight inferior apertures at the extremity of a [illegible] peduncle provided with four very strong and foliaceous arms. Four ovaries. Stomach with cruciform appendages.

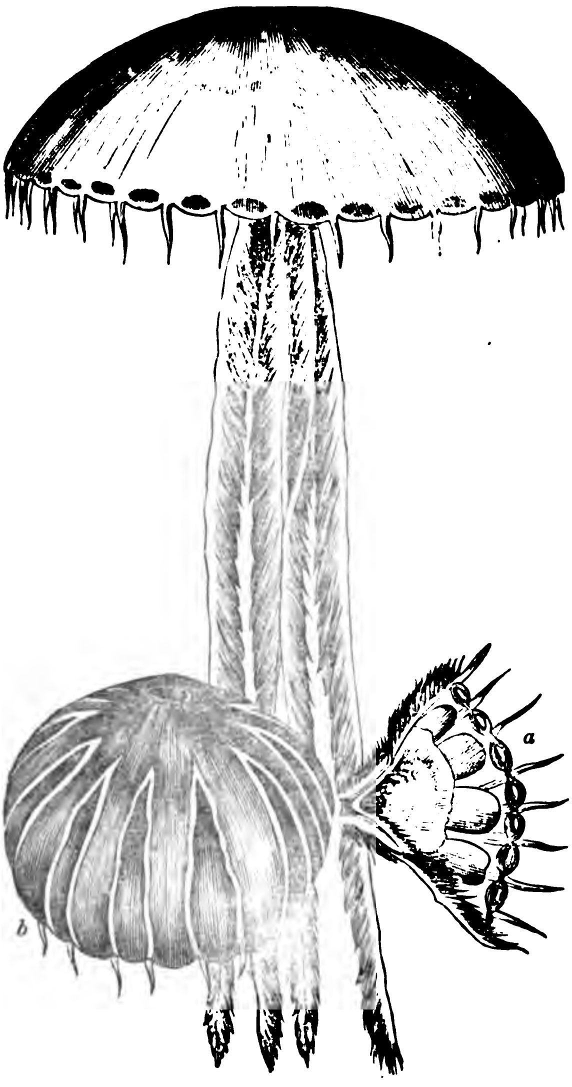
Example, *Pelagia Labiche*, Less. (*Ocyan Labiche*, Quoy and Gaim.).

Pelagia Labiche.

Chrysaora.

Generic Character.—*Body* circular, hemispherical, festooned and provided with at least twenty-four tentaculiform cirrhi on its circumference; excavated internally into a considerable cavity with sacciform appendages; communicating externally by a single orifice, pierced in the centre of a median peduncle, provided with distinct brachideous appendages. Four ovaries.

Example, *Chrysaora lutea.*



Chrysaora lutea.

a, fourth of the disk or umbrella seen from below; *b*, disk without its appendages.

Rhizostoma.

Generic Character.—*Body* circular, hemispherical, provided on its circumference with lobes or festoons intermingled with auricles, largely excavated below, with four semilunar orifices, produced by four roots of insertion of a considerable pedunculated mass, afterwards divided into eight very complex brachideous appendages furnished with fibrillary suckers, without a median prolongation. Four ovaries, in the shape of a cross. Stomachal cavity very large and vascular at its circumference.

Example, *Rhizostoma Cuvieri.*

Habitat.—European Seas.

M. de Blainville separates the genus into two divisions.

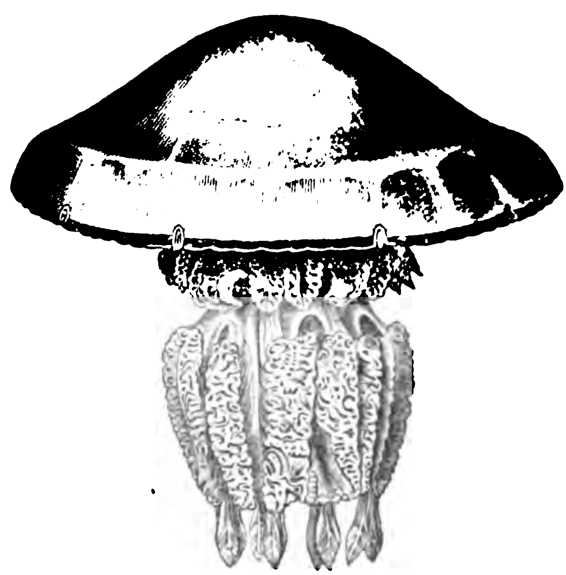
A

Species having a peduncle of insertion for the root, with radical appendages, besides those of the arms.

B.

Species having a very short peduncle of insertion, without radical appendages, besides the four bifid arms. (*Evagora*, Pér.)

We have given an illustration of the first. The species grows to a very large size.



Rhizostoma Cuvieri.

Fossil Impressions of Medusæ?

Mr. Babbage, in his paper 'On Impressions in Sandstone resembling those of Horses' Feet,' December, 1836, in which he noticed those in the channel of a stream on the extensive moor called Pwll-y-Duon, about seven miles from Merthyr Tydvil, to which his attention was drawn by Mr. Guest of Dowlais, and the analogous casts in the old red-sandstone of Forfarshire, there called *Kelpies' feet*, described some observations recently made by Mr. Lyell, on impressions left by *Medusæ* on the rippled sand near Dundee. On removing the gelatinous body of the animal, a circular space was exposed, not rippled, but having around half the border a depression of a horse-shoe form. These marks however were not considered by Mr. Lyell as identical with those called *Kelpies' feet*, but merely so far analogous as to invite further observations, and to make it desirable to possess drawings of the impressions which different species of *Medusæ* leave when thrown by the tide upon a beach of soft mud or sand. (*Geol. Proc.*, vol. ii.)

PULMONELLA. [Synoicum.]

PULMONELLUM. [Zoophytaria.]

PULP is a name given in vegetable physiology and botany to such parts of plants as are semifluid. This substance appears to the naked eye as a mucilaginous unorganised mass of the nature of a secretion; but it is in reality composed of very thin-sided cells which have little power of cohesion, and secrete in their interior a greater abundance of fluid than is usual. Pulp may therefore be regarded as young and imperfectly formed tissue filled with the secretions peculiar to the species. It is also in some cases, perhaps in all cases, mixed with an abundance of cinenchyma or laticiferous tissue, which passes through it in all directions in the form of the most delicate ramifications. The pulp of the grape affords a good example of this. To the naked eye it appears to be nothing more than a fleshy homogeneous mass that may be compared to half-consolidated gum; but under the microscope it is found to be a congeries of oval transparent bags turgid with fluid and very easily ruptured; treated with iodine, they lose their transparency in some measure, and acquire a brown colour, when their limits become very distinct. The same re-agent stains still browner the vessels of the latex, whose course and position are thus brought clearly into view. In a few minutes however the colouring fades away in the latter, till they become as indistinct as they were before the iodine was applied: it is therefore necessary that the observation should be made as soon as the iodine has seized upon the latex or its tubes.

PULPIT. This term affords a striking instance of the great change of meaning and application which words frequently undergo, for, exclusively of the Latin termination, it is identical with *Pulpitum*, which signified that part of the Roman stage (distinguished from the orchestra) on which the actors recited and performed their parts. The French *Pupitre* and the English *Pulpit* both come from the same *ambo*, but are dissimilar in signification; the former meaning merely a reading-desk, and *Chaire* (*Cathedra*) being the term that corresponds with our English one. The *Ambo* of the early Christians appears to have been different both in form and purpose from pulpits afterwards used for preaching, it being rather a low platform on which parts of the service were sung or recited. The most ancient pulpits now existing are supposed to be those in S. Lorenzo fuor delle Mura and S. Clemente at Rome; and these and other early pulpits of the same kind are of marble, with inlaid or mosaic compartments. In the church of S. Lorenzo at Florence, and several other modern basilicas, there are two pulpits, one on each side of the nave. Great cost both of material and workmanship was frequently bestowed on pulpits; and some of them rank among the most celebrated monuments of art of their period. Nicola and Giovanni Pisano [Pisano], Donatello, Benedetto da Majano, and other eminent sculptors, employed their talents upon such works. The pulpit in the baptistery of Pisa, by Nicola, is hexagonal, and supported on seven columns, one at each angle and a central one. Giovanni Pisano executed that in the nave of the Duomo at Pisa, besides which there are two others in the same church, on the opposite sides of the choir. The *Pergamo* of Santa Croce at Florence, by B. da Majano, is greatly extolled by Vasari for the beauty of its reliefs and sculptures. The two *pergami* in S. Lorenzo at Florence, similarly placed opposite each other, are the work of Donatello; and of the mastery of composition displayed in their reliefs some idea may be formed from the specimen given of them in Cicognara's 'Storia della Scultura.' Notwithstanding the richness of such pulpits, and their elaborate execution, their general forms are not always the most pleasing or appropriate.

For a long time the pulpit appears to have been treated as an architectural feature of the interior, being constructed, if not of marble, of the same material as the rest. Among numerous other examples of Gothic stone pulpits may be mentioned that in the nave of Strasburg cathedral, which is spoken of by Dr. Dibdin in terms of unqualified admiration; yet it is too much of a jumbled mass of ornament, and the whole of the canopy is in exceedingly bad taste, though not quite so vicious as that afterwards displayed in many Roman Catholic pulpits whose canopies are made in the form of clouds, curtains, palm-branches, and similar extravagancies. One of the most celebrated as a performance of art is the magnificent oak pulpit in the nave of St. Gudule, at Brussels; the whole is elaborately carved, and the pulpit itself is supported by figures representing Adam and Eve expelled from Paradise by the Angel.

Of stone pulpits we have few remaining in this country; but there is one in Bristol cathedral, and another in Worcester, drawings and details of which latter are given in Pugin's 'Gothic Specimens.' It was originally erected in the nave, near the west end, but has been removed to the north side of the choir, and has been greatly disfigured by modern 'beautifying,' a flat sounding-board having been added to it in the shape of a bed-tester 'with paltry little scolloped festoons.' Even the pulpit itself is not remarkable for the elegance of its details, although its general form is good. This and another subject represented in the same work are instances of what may be termed *oriel pulpits*, being made to project after the fashion of an oriel [Oriel] from a pier or wall, and similarly corbelled below, instead of being supported from the ground. The second of the above-mentioned examples is in fact a small oriel in an angle of the outer court of Magdalen College, Oxford; and another, still more ancient and curious—and we may add, more beautiful—is that at Beaulieu, Hants, which projects from an elegant open Gothic arch, and is supported, not on a corbelled and moulded oriel-stool, but on a short reversed spire, whose angles are decorated with small pillar-shafts, and the sides between them with foliage: a representation is given in the plates to the 'Glossary of Architecture.' Besides pulpits of this kind in the courts and cloisters of religious houses, there were others called *Preaching-Crosses*, from which sermons were delivered in the open air: Paul's Cross is a celebrated and well-known instance.

At the present day very few of the pulpits in our English churches have any beauty of form or character, but are frequently tasteless excrescences, encumbered with steps, reader's-desk, &c. and with respect to design, they are mere carpenter and joiner's work. Of late years the practice has been introduced of having two distinct pulpits, one for the reader, the other for the preacher, placed on opposite sides of the chancel; whereby architectural symmetry at least is kept up; yet this has been objected to as a reprehensible departure from strict usage, and likewise an absurdity, though if there be absurdity in having two pulpits when only one is required at a time, the absurdity is the same whether they be united together, one above the other, or placed singly. The two might very properly be combined, were the pulpit to be made a central object in a church, by being so placed at the altar-end of the chancel; but though it has occasionally been adopted, such mode is still more strongly objected to as being offensively indecorous, because in such case the pulpit must be before the altar. It might however be at such distance from it as not to obtrude upon it; and as to indecorum, when no irreverence is intended, but merely convenience is consulted, the impropriety becomes excusable, such situation being certainly the most advantageous of any, because the preacher is then both heard and seen more distinctly by the whole congregation than when he is stationed on one side of the church.

PULSE. [Heart.]

PULTAWA. [Poltawa.]

PULTENEY, WILLIAM, Earl of Bath, was born in 1682. He was the eldest son of a father of the same names, whose father, Sir William, had represented the city of Westminster in parliament with some distinction. The surname is supposed to have been taken from Pulteney in Leicestershire, where the family had been anciently established.

Young Pulteney, having been sent first to Westminster school and then to Christ Church, Oxford, afterwards travelled on the Continent, and on his return home was brought into parliament for the borough of Hedon in Yorkshire. This appears to have been in 1705. He was indebted for his seat to his guardian, Henry Guy, Esq., formerly secretary to the treasury, who afterwards left him a legacy of 40,000*l.* and landed property to the value of 500*l.* a year. Pulteney besides derived a considerable estate from his father, and he also received a large portion with his wife, Anna Maria, daughter of John Gumley, Esq., of Isleworth. All this wealth he increased by the practice throughout his life of a very rigid economy, 'which,' says Coxe, in his 'Memoirs of Walpole,' 'his enemies called avarice, but which did not prevent him from performing many acts of charity and beneficence.'

From his entry into the House of Commons, Pulteney attached himself to the Whig party, which was that of his family. He continued to sit for Hedon throughout the reign of Anne; but his name does not appear in the reported parliamentary debates during that reign. Coxe however states that he spoke for the first time on 'the Place Bill,' which he warmly supported. Place Bills, or proposals for excluding placemen from parliament, were brought forward in the House of Commons almost every session in this reign. Coxe also tells us that he distinguished himself on the question of the prosecution of Sacheverell; that he had made himself so obnoxious to the Tories, that when they came into power, in 1710, they revenged themselves upon the young orator by removing his uncle, John Pulteney, Esq., from the board of trade; that during the last four years of Queen Anne he not only took a principal share in the debates, but was admitted to the most important secrets of his party; and that on the prosecution of Walpole, in 1712, Pulteney defended his friend in a very elegant speech. He certainly was looked upon by this time as one of the leading men of his party.

On the accession of George I. Pulteney was appointed secretary-at-war; but when Walpole resigned in 1717, Pulteney also gave up his office. Soon after this however a coolness took place between the two friends, which was not removed by the appointment of Pulteney to the valuable sinecure of cofferer of the household on Walpole's resumption of office in 1720; but it was not till 1725 that Pulteney openly threw himself into the ranks of opposition, and began that course of bitter and incessant attack upon the minister, which did not cease till he had driven Walpole from power in 1742. Nor did he confine his exertions to his place in parliament; out of doors he entered into a close union with the party of which Bolingbroke was the head, and became the principal assistant of that writer in his paper called the 'Craftsman.' By his shining powers as a debater also, and the flaming patriotism with which he filled his harangues as leader of the opposition, he raised himself to the height of public favour, and was for some years the most popular man in the kingdom. When the administration of Walpole was at last overthrown, all the authority of the state seemed for a moment to lie at the feet of Pulteney; and he actually named the new ministry, taking to himself a seat in the cabinet without any office. But the arrangements that were made had in fact been all, it may be said, dictated by Walpole, who still retained his influence with the king, and secretly arranged with his majesty the course into which Pulteney was to be seduced with the view of destroying the popularity which was his chief strength. The composition of the new cabinet disappointed the expectations both of partisans and of the public; everything wore the appearance of its apparent maker having in fact made a compact and a compromise with Walpole; one considerable section of his late supporters (that headed by the Pitts and the Grenvilles) was wholly overlooked in the distribution of places; and the suspicion and sense of injury awakened by all this burst into a universal storm of indignation when, after the lapse of a few months, Pulteney walked into the House of Lords as earl of Bath. From this moment the late popular idol became quite insignificant. However he lived till 1764, chiefly occupied in nursing his private fortune, but still sometimes taking part in the debates and in public affairs. In the year 1760 he published 'A Letter to Two Great Men' (Mr. Pitt and the Duke of Newcastle), in which Horace Walpole, perhaps from no better authority than his own suspicion and spite, says he was assisted by his chaplain Douglas (the same who afterwards became successively bishop of Carlisle and of Salisbury). Walpole adds, 'It contained a plan of the terms which his lordship thought we ought to demand if we concluded a peace; it was as little regarded by the persons it addressed as a work of Mr. Pitt's would have been, if, outliving his patriotism, power, and character, he should twenty years after have emerged in a pamphlet.' ('Mems. of George II.,' ii. 412.) However the caustic annalist allows that 'it pleased in coffee-houses more than it deserved.' Pulteney left no family, and his peerage became extinct on his death; but the title of baroness Bath was conferred in 1792, and afterwards that of countess of Bath in 1803, on Henrietta Laura Pulteney, daughter of Frances Pulteney, and Sir William Johnson, Bart. (who took the name of Pulteney), and great-granddaughter through her mother of a younger brother of the first earl's father, according to Coxe (who had his information from Bishop Douglas), or (according to other authorities) daughter of the earl's own younger brother Henry. This lady, who inherited the earl's fortune, died also without issue in 1808, and the title is now again extinct.

PULVINITES. [MALLEACEA, vol. xiv., p. 836; MARGARITACEA.]

PUMICE. [LAVA; VOLCANO.]

PUMP. [AIR-PUMP; HYDRAULICS.]

PUMPKIN is the vulgar name of the fruit of the *Cucurbita maxima*, a plant whose native country is not certainly known, but which is probably a variety of *C. Pepo*, a species inhabiting the Levant. It is, as is well known, an annual plant, sending forth many long succulent angular rough shoots, bearing leaves and flowers something like those of the cucumber. Its fruit is often of enormous size, specimens having been produced in this country weighing 220 lbs., and in hotter countries they are still larger. This kind of fruit is however only furnished by the variety called the yellow Potiron; in other varieties it is much smaller. The seed of the pumpkin should be raised in a frame, in a garden pot, after the same manner as the cucumber, and planted out upon a dunghill, or in any well-manured soil, as soon as the frosts are gone. Its young tender leaves and shoots constitute the best of all spinach; and the fruit, when ripe, is used for soup, or is baked with pears as an ingredient in tarts; when young, it may also be boiled and brought to table like vegetable marrow.

PUN. A pun has been defined by Addison (*Spectator*, No. 61) to be 'a conceit arising from the use of two words that agree in the sound but differ in the sense.' Sometimes however the pun is effected by the employment of only one word, which is susceptible of a double application; as when one who had undertaken to pun upon any subject that should be given him, on being desired to make a pun on the king, answered that the king was no subject. Sometimes too the sound that is thus made to convey two ideas at once not an entire word, but only a syllable. The definition moreover to be complete ought to have explained in what the effect of the conceit consists. It appears to be, as we have just hinted, in the novelty and unexpectedness of the signification or application presented by the pun—a novelty which always at least produces surprise, and often the livelier titillation of a grotesque or otherwise ludicrous image. Sometimes, though rarely, a pun has risen into a far higher region than the ludicrous; as for instance when Burke (or whoever else it was) exclaimed, 'What is (m)ajest(y) when deprived of its externals but a jest?' So, in his account of his ramble through London, in the 'Spectator,' No. 454, Steele tells us that when he looked down from one of the windows on the first floor of the Exchange upon the area below, 'where all the several voices lost their distinction and rose up in a confused humming,' a reflection occurred to him that could not have come into the mind of any but of one a little too studious; 'for,' he adds, 'I said to myself, *with a kind of pun in thought*, what nonsense is all the hurry of this world to those who are above it?' It may be observed that both these last-mentioned puns arise not out of the similar sound of two words, but out of the double application of one—*externals* in the former, *above* in the latter.

A sketch of the history of puns has been given by Addison in a well known paper in the 'Spectator' (No. 61), in which he traces the existence of the practice from the time of Aristotle downward. The figures of speech or turns of expression known among the Greeks by the names of the paragramma (παράγραμμα), and the paronomasia (παρωνομασία), the antanaclasis (ἀντανάκλασις), and the ploke (πλοκή), were often merely what we should now call puns. Addison observes that Aristotle, in the eleventh chapter of his 'Rhetoric,' describes different kinds of puns or paragrams, among the beauties of good writing, and produces instances of them out of some of the greatest authors in the Greek tongue. 'Cicero,' he adds, 'has sprinkled several of his works with puns, and in his book, where he lays down the rules of oratory, quotes abundance of sayings as pieces of wit, which also upon examination prove arrant puns.' 'I do not find,' he afterwards says, 'that there was a proper separation made between puns and true wit by any of the ancient authors except Quintilian and Longinus.' We may also refer to another very clever paper in the 'Guardian' (No. 36), attributed to a writer of the name of Birch, which contains what is called 'A Modest Apology for Punning.' In the introduction to this paper the distinction is happily enough drawn between the extemporaneous puns of conversation and the punning in deliberate and grave compositions, which in this country, in the early part of the seventeenth century, used to be reckoned eloquence and fine writing. 'I look,' says the author, 'upon premeditated quibbles and puns committed to the press, as unpardonable crimes. There is as much difference betwixt these and the starts in common discourse, as betwixt casual rencontres and murder with malice prepense.'

The philosophy of the pun, and its relation to alliteration, rhyme, and other forms of speech, the effect of which is derived partly from the sound, might afford matter for some speculation.

PUNCH, the name of the principal character in a well known puppet-show which is exhibited about the streets, and which appears to have originated in Italy; the name is a corruption of Policinella, the Neapolitan clown, who is generally the leading character in puppet-show performances. But the show itself, or rather the puppets, are styled by the Italians 'fantoccini.' Galiani, in his 'Vocabolario del Dialetto Napoletano,' gives the following account of the origin of Policinella, or rather Polecenella, as it is pronounced by the Neapolitans. A company of strolling comedians once arrived at the town of Acerra near Naples, in the season of the vintage. The vintagers are, by traditional custom, licensed jesters. The comedians fell in with a band of vintagers who assailed them with jokes and vociferations, which the comedians retorted. One of the vintagers, called Puccio d'Aniello, or Puccio the son of Aniello, remarkable for a very large nose and grotesque appearance, was the most forward and witty of all his band, and at last the comedians were fairly beaten out of the field. Reflecting on this occurrence, the comedians thought that a character like that of their antagonist Puccio d'Aniello might prove very attractive on the stage, and they proposed an engagement to him, which he accepted. The engagement proved profit able to both parties: and the consultants had crowded houses wherever they went. After some years, Puccio d'Aniello died, but his place was filled by a well-taught pupil in his art, who assumed his name, adopted the Pulcinella, and also his manners and costume, with a mask which perpetuated the features of the deceased villager. By degrees, personifications of the original Pulcinella were multiplied all over the country, and the name and character have thus become immortal. It is remarkable that the district in which Acerra is situated was remarkable in ancient times for that kind of dramatic rude and farcical humour which has made the reputation of the modern Pulcinella. (ATELLANAE FABULAE.)

PUNCTUATION is the art of dividing written or printed composition into sentences and clauses, by points or stops, so as to indicate the closer or more remote connection of the several parts. It serves to elucidate the sense, and thus also assists the delivery, since the latter must have reference to the grammatical construction.

The elements of a system of punctuation are discoverable in ancient times. Aristotle mentions the subject in his 'Rhetoric' (iii. 5); Jerome, in the fourth century, alluded to the punctuation of the sacred books which he revised; about the middle of the fifth century Euthalius published an edition of the four Gospels, and afterwards of the Acts and of all the apostolical Epistles, in which he divided the New Testament into *stichoi* (στίχοι), or lines, regulated by the sense, so that each terminated where some pause was made in the reading; and in the Alexandrine manuscript, which may be referred to the fourth or fifth century, we find not only a break at the end of each paragraph, but stops, similar to the higher part of our colon, inserted, though sparingly, in the body of the sentences.

The invention of the modern system of punctuation has been attributed to Aristophanes, a grammarian of Alexandria; but the subject was very imperfectly understood till the close of the fifteenth century, when the learned Venetian printers, the Manutii, increased the number of the signs, and established some fixed rules, which have been so generally adopted, that we may regard them as the inventors of the present system.

The points used in English composition are:

The comma, marked thus	,	The period or full stop	.
The semicolon	;	The interrogation	?
The colon	:	The admiration	!

to which may be added the dash —, the apostrophe ', and the parenthesis ( ).

It is considered that the proper length of the pause at a comma is while we may count *one*; at a semicolon *two*; at a colon *three*; and at a period *four*. But it will be easy to show that there is frequently a much greater separation of the sense, and that there ought therefore to be a longer pause at some commas than at others. Thus in the following sentence there should evidently be a longer pause after *instance*, than after *candour*, *fortitude*, *charity*, and *generosity*, though these words are all followed by the same mark of grammatical punctuation, namely the comma: "The qualities of candour, fortitude, charity, and generosity, for instance, are not in their own nature virtues; and if ever they deserve the title, it is owing only to justice, which impels and directs them."

The form and structure of sentences are so various, that it would be difficult, if not impossible, to lay down rules for punctuation which shall meet every case which can occur. The following may serve as a general guide:

I. The *comma* is used—

1. To throw together such similar parts of speech as are joined in pairs by the conjunction *and*.

2. To separate the several members of a *series*, i.e. a succession of similar words or members.

3. To separate from the rest of the sentence such clauses as are added by way of explanation or illustration, or such as are really parenthetical, though they may not be so marked.

4. To separate from the rest of the sentence words in the vocative case.

5. In many cases to separate the relative and the antecedent.

6. To separate from the rest of the sentence such clauses as are introduced by a conjunctive, conditional, or exemptive particle, or by an adverb of time or place; and to separate explanatory clauses, and such comparative clauses as are introduced by the adjectives *like*, *&c.*, by the conjunctions *as*, *so*, *than*, by the adverbs *how much*, *more*, *almost*, *rather*, unless the comparative member at the end be short.

II. The *semicolon* is used when a longer pause is required than at a comma, but when the sense is imperfect, and needs some other member to render it complete. Or it is used for dividing a compound sentence into two or more parts, which are not so closely connected as those which are separated by commas only, nor yet so independent and perfect as those which admit a colon: thus—

'Life, with a swift though insensible course, glides away; and like a river which undermines its banks, gradually impairs our state.'

'As there is a worldly happiness which God perceives to be only disguised misery; as there are worldly honours which in his estimation are a reproach; so there is a worldly wisdom which in his sight is foolishness.'

III. The *colon* may be inserted—

1. When a member of a sentence is complete in itself, but is followed by some additional remark or illustration of the subject: thus—

'Do not flatter yourself with the idea of enjoying perfect happiness: there is no such thing in the world.'

'Keep close to thy business: it will keep thee from wickedness, poverty, and shame.'

2. When several semicolons have preceded, and when a longer pause is necessary in order to mark the connecting or concluding sentiment: thus—

'A divine legislator uttering his voice from heaven; an almighty governor stretching forth his arm to punish or reward; informing us of perpetual rest prepared hereafter for the righteous, and of indignation and wrath awaiting the wicked: these are the considerations which overawe the world, which support integrity, and which check guilt.'

3. A colon is generally placed at the close of the words which introduce an example, a quotation, a saying, a speech, or a narrative: thus—

'The earl of Chatham made an excellent speech, from which the following is a brief extract: "I know that the conquest of British America is an impossibility."'

IV. The *period* or full stop is placed at the end of a *sentence*, i.e. at the end of such an assemblage of words as present a complete and independent sense: thus—

'Truth is the basis of every virtue.'

'The Latin tongue is now called a dead language, because it is not spoken as the mother tongue of any nation.'

In some sentences an additional clause is included, which does not modify the preceding: thus—

'The law of the Lord is perfect, converting the soul.'

These are called *loose sentences*.

The *note of interrogation*, as its name implies, is placed at the end of every question.

The Spaniards place this mark also *at the beginning* of interrogative sentences; and it must be acknowledged that in some cases this is an advantage, as it suggests to the reader from the first the tones of voice which are suitable.

The *note of exclamation* or *admiration* is placed at the end of such words or clauses as express any strong passion or emotion of the mind.

The *dash* should be used sparingly: it is introduced with propriety where a sentence or dialogue breaks off abruptly; where the sense is suspended, and continued after a short interruption; where a significant pause is required; where there is an unexpected turn in the sentiment, or a sort of epigrammatic point; where a sentence consists of several clauses which form the nominative to a verb following, or lead to a conclusion or inference, and it is desirable to assist the eye more readily than by semicolons; and in some cases to indicate an ellipsis.

The *apostrophe* shows the omission of a letter, as in *form'd*, *e'en*, *e'er*, used chiefly in poetry; and in the genitive case, as *man's*, *boys'*, both in prose and poetry.

The *parenthesis* marks a clause which should contain some necessary information, or a useful remark, introduced into the body of a sentence *indirectly*, but which might be omitted without doing injury to the sense or the construction.

(For more ample illustrations of this subject, see Steel's *Elements of Punctuation*, 12mo., London, 1786; *Principles of Punctuation*, by the Rev. C. Hartley, 18mo., London, 1818; and *The Principles of English Punctuation*, by G. Smallfield, 12mo., London, 1838.)

It has been remarked above, that one use of the pauses is as a guide to reading; but it must not be supposed that those which are usually inserted even in well punctuated books are sufficient for this purpose. Thus in the following sentence we find only one pause, namely after *fine*:—

'The descriptive part of this allegory is likewise very fine, and full of sublime ideas.'

But were it merely for the purpose of taking breath, it would be necessary to pause in the first clause, and the most suitable place for doing this is after *allegory*. The words *the descriptive part of this allegory* stand in the relation of a compound nominative case to the verb; and it may be laid down as a rule that there should always be a pause in good reading after such a combination of words as this. There should be a pause in reading between the object and the modifying words in the inverted order; as after *man*, in the following sentence: 'He was a man patient, sober, honest, and industrious;' and after *love* in the following: 'To love wisely, rationally, and prudently, is, in the opinion of lovers, not to love at all.' There should also generally be a pause after prepositions. In accordance with these remarks, we should place a pause in reading after *passion*, *admiration*, *effects*, and *behaviour*, in the following sentence, though the printer would insert none at all; and bishop Lowth lays it down as a rule, that a simple sentence, *i.e.* one consisting of one subject and one finite verb, does not admit of a pause between any of its parts:

'A violent passion for universal admiration produces the most ridiculous effects in the general behaviour of women of little sense.'

When it is also considered, as has been before remarked, that the points are not sufficiently discriminative, it will be perceived that they are, as at present placed, a very imperfect guide to the pauses which good reading requires.

(See this subject treated at length in Walker's *Elements of Elocution*, and Wood's *Grammar of Elocution.*)

PUNIC WARS (*Punica bella*), the three great wars between the Carthaginians (*Pœni*) and the Romans.

I. The *First Punic War*, which lasted nearly twenty-three years (A.U.C. 490-513, or B.C. 264-41), arose out of the application of the Mamertines of Messana to Rome (B.C. 264) for aid against the Carthaginians, and Hiero, king of Syracuse. [CARTHAGE, vol. vi., p. 327.] The senate of Rome, who had only six years before severely punished in the Campanians of Rhegium a similar act of piracy to that by which the Mamertines had established themselves at Messana, refused to take part with the latter against their own allies, Hiero and the Carthaginians. Upon this the consuls, Appius Claudius Caudex and Marcus Fulvius Flaccus, brought the subject before the people in the comitia, and, by appealing to their jealousy of the Carthaginian power, and by representing the gain to be made by a contest with so wealthy a state on the fertile plains of Sicily, they prevailed upon them to espouse the cause of the Mamertines.

At the beginning of the war the Carthaginians were masters of the sea, and possessed a well furnished treasury, which enabled them to enlist a large number of mercenaries. These hired forces however were no match for the citizen-soldiers of Rome, whose native vigour more than compensated for her limited resources.

While preparations were being made to commence the war, Caius Claudius crossed over to Messana, and treacherously seized Hanno, the Carthaginian governor of that city, who surrendered the citadel to purchase his freedom, and for this act of weakness was crucified on his return to Carthage. Hiero and the Carthaginians now blockaded Messana; but the consul Appius Claudius succeeded in eluding the Carthaginian fleet and carrying over his army from Rhegium to Messana, where he defeated first the Syracusans and then the Carthaginians, and, after raising the siege of Messana, pursued Hiero to the walls of Syracuse. This city however and that of Egesta resisted his attempts to take them, and, after overrunning the open country, he returned to Rome. In the next spring (B.C. 263) two consular armies were sent to Sicily, and Hiero, after severe losses, made a peace with the Romans, and remained their firm ally for the rest of his life. In the next year (B.C. 262), the Romans took Agrigentum, after a siege of about seven months; but they now began to feel their operations greatly embarrassed by the naval supremacy of the Carthaginians. They resolved therefore (B.C. 261) to have a fleet. Hitherto their only vessels had been triremes and penteconters; the quinqueremes (which Dr. Arnold happily terms 'the line-of-battle ships of that period') they did not even know how to build. They found a model in a Carthaginian vessel which had accidentally fallen into their hands, and in two months they built a fleet of a hundred ships, the crews having in the mean time been trained to row. With this fleet the consul Caius Duilius defeated the Carthaginian fleet under Hannibal off Mylæ (*Melazzo*), on the northern coast of Sicily, taking or destroying about fifty ships and 10,000 men. This naval victory, the first which the Romans ever gained, appears to have been chiefly owing to their use of a peculiar machine for grappling with and boarding the enemy's ships. Its moral effect was of the greatest consequence, and the people showed their sense of its importance by the extraordinary honours which they conferred upon Duilius. After three years of indecisive warfare, the Romans gained another naval victory off the Liparæan Islands (B.C. 257), which emboldened them to carry the war into Africa. They prepared during the winter a fleet of 330 ships, the crews of which, exclusive of fighting men, amounted to nearly 100,000 men, and in the spring of the year 256 B.C., the two consuls, L. Manlius Vulso and M. Atilius Regulus, crossed over to Africa, after defeating a Carthaginian fleet of 350 ships off Ecnomus, on the southern coast of Sicily. They landed at the fortress of Aspis or Clypea, and proceeded to ravage the fertile country around. After some weeks, Manlius was called back to Rome, and Regulus was left in Africa with 15,000 foot and 500 horse. He overran the country, which was destitute of fortified places, without opposition, and established his head-quarters at Tunes, about fifteen miles from Carthage. The Carthaginians now sued for peace, but Regulus treated their envoys with the utmost arrogance, and offered them terms so intolerable, that they rejected them indignantly. At this period there arrived at Carthage a Spartan officer named Xanthippus, who had already acquired considerable military fame. The Carthaginians put their armies under his command, and soon completely defeated the Romans, taking Regulus prisoner (B.C. 255). The fortress of Clypea was now all that remained to Rome of her African conquests, and this was immediately evacuated. The fleet which carried away the remains of the Roman army suffered a disastrous shipwreck on the southern coast of Sicily. The Carthaginians now renewed their efforts in Sicily: Agrigentum was recovered by Carthalo, and Hasdrubal was entrusted with the chief command in the island, while Panormus was taken by the Romans. The loss of another fleet by shipwreck (B.C. 253) put a stop for a time to the naval exertions of the Romans. During the next two years the Romans gained no ground, and their armies fell into a bad state of discipline; but in the year 250 B.C., L. Cæcilius Metellus gained a great victory over Hasdrubal at Panormus. In this battle thirteen noble Carthaginians had been taken prisoners, and, in order to recover them, the Carthaginians sent an embassy to Rome to propose an exchange of prisoners. Regulus accompanied the embassy, having promised to return if it failed. He met the senate, advised them to refuse the exchange, and, upon his counsel being followed, he returned to Carthage, where he soon after died. In the autumn of this year the Romans laid siege to Lilybæum, the only place, except Drepanum, which the Carthaginians retained in Sicily; but though two consular armies were engaged in the siege, the town resisted all their attacks, and they were compelled to turn the siege into a blockade, but even then they were unable to prevent the introduction of supplies and reinforcements by sea. In the year 249 B.C., the Carthaginian general Adherbal gained a great naval victory over P. Claudius, the consul, off Drepanum, and in the same year two Roman fleets, consisting of corn-ships and ships of war, were totally wrecked off Cape Pachynus, and the war continued for some time in favour of the Carthaginians. In the year 247 B.C., the great Hamilcar Barcas was appointed to command the Punic forces in Sicily. He conceived the plan of forming a body of infantry able to cope with that of the Romans, and for this purpose he avoided pitched battles, and kept up an incessant war of posts, fixing his head-quarters first on the summit of an almost impregnable table-mountain near Panormus (now Monte Pellegrino), and afterwards on Mount Eryx, and thus for six years he baffled all the Roman armies. At length the Romans, by an extraordinary effort, sent another powerful armament to sea, under the command of the consul Caius Lutatius Catulus (B.C. 242). The Carthaginians hastily equipped a fleet, and sent it out under the command of Hanno. The fleets met at the Aegates, a group of islands off the western point of Sicily, and Lutatius was completely victorious. This battle put an end to the war. Both parties were exhausted by the struggle, and though victory had declared in favour of the Romans, they could not hope to reduce Lilybæum, Drepanum, and Eryx, especially when defended by so firm and able a man as Hamilcar, without very great trouble, while the Carthaginians could look for nothing better than merely to retain these places. A peace was therefore concluded on the following terms:—that the Carthaginians should evacuate Sicily and the adjacent small islands; that they should pay 3200 talents to Rome within ten years; that they should release all Roman prisoners without ransom; and that they should make no war on Hiero or his allies.

Thus ended the first Punic war, which was a contest for the possession of Sicily and the sovereignty of the sea, by the loss of which, Heeren remarks, the fate of all the other external possessions of Carthage was already predetermined; while the Romans, by the expulsion of the Carthaginians from Sicily, were delivered from a danger which threatened the security of their Italian empire. The next and fiercest struggle of the rival republics was for the complete supremacy of the one over the other; the third and last was, on the part of Carthage, for existence.

II. The causes of the *Second Punic War* are to be found in the position in which the two parties were left by the first; the Romans still dreading the power of Carthage, and the Carthaginians burning to avenge their losses. This was especially the feeling of Hamilcar Barcas and his party, and it is not improbable that the war would have been renewed in his life-time, but for the insurrection of the mercenaries. [CARTHAGE; HAMILCAR.] After concluding the mercenary war, Hamilcar prepared for the contest by bringing Spain under the Carthaginian rule, and forming there a veteran army; and above all, by training up his son Hannibal to be the uncompromising enemy of the Romans. In the meantime, Rome committed an act of wanton aggression by seizing upon the island of Sardinia (B.C. 237). At length, in the year 218 B.C., Hannibal commenced the war by taking Saguntum, a town on the eastern coast of Spain, some distance south of the Ebro, which was under Roman protection, and by crossing the Ebro, which had been fixed by a treaty (B.C. 226) as the boundary between the Roman and Carthaginian possessions. By a master-stroke of warlike policy, he resolved to make Italy itself the theatre of war. The details of his march into Italy, his victories at the Ticinus, the Trebia, and the Trasimene lake, his complete overthrow of the Romans at Cannæ, the indecisive progress of the war in the following years, during which Fabius Maximus and Marcellus kept Hannibal in check, and the complete turn of the scale in favour of the Romans by the destruction of Hasdrubal's army (B.C. 207), are given under HANNIBAL. The exploits of Scipio Africanus in Spain, his invasion of Africa, and his defeat of Hannibal at Zama (B.C. 202), are related in the article SCIPIO. The battle of Zama concluded the war. Peace was granted to the Carthaginians on the following terms: they were to retain only their territory in Africa; they were to give up all their ships, except ten triremes, and all their elephants; they were to pay the Romans 10,000 talents, at the rate of 200 a year; they were to commence no war without the consent of Rome; and to restore to Massinissa all his hereditary possessions. Thus Carthage became little more than a vassal of Rome. But this was not enough. It was deemed necessary by a powerful party at Rome that Carthage should be destroyed, and for this end, to which they were also urged by personal motives, they induced the people to engage in a third war, for which a pretext was easily found. [CARTHAGE, vol. vi., p. 327-328.]

III. The *Third Punic War* began in the year 149 B.C., and lasted only three years. Its unprovoked commencement, its treacherous conduct, and its cruel consummation reflect disgrace upon Rome. When the Carthaginians found that the Romans were resolved on their destruction [CARTHAGE, p. 328], they made the most vigorous preparations for a resolute defence. The consuls Censorinus and Manilius attacked the city on opposite sides, but were repulsed. Other reverses followed. The consuls of the following year (148, B.C.) were equally unsuccessful. But in the next year (147 B.C.) Scipio Æmilianus finished the war by the capture of Carthage. [SCIPIO.] By a decree of the senate, the city was razed to the ground, and Africa was made a Roman province.

(Polybius; Livy; Appian's *Punica* and *Hannibalian War*; Plutarch, *Marcellus, Fabius Maximus;* Zonaras; Niebuhr and Arnold's *Histories of Rome* (for the first Punic War); Heeren's *Manual of Antient History;* Clinton's *Fasti Hellenici.*)

PU'NICA, a genus of plants of the natural family of Myrtaceæ, sometimes distinguished, in consequence of its having two verticels of capsules developed instead of one, from Myrtaceæ under the name of Granateæ. The genus consists of only a single species, the celebrated Pomegranate, with a dwarf variety, which is sometimes considered a distinct species. The pomegranate has from the earliest periods formed an object of attraction in the countries from Syria to the north of India, where it grows in perfection, as well as in the north of Africa; and this, as well from its shining dark-green foliage, as from its conspicuous flowers, of which the flower-cup and petals are both of a crimson colour, while its large red-coloured fruit, filled with juicy pleasant-flavoured pulp, which covers its numerous seeds, makes it an object of desire in hot countries. Thus we find it mentioned in the Bible under the name Rimmon (*Numbers*, ch. xiii.), and we hence learn that it was cultivated in Egypt and also in Palestine; by the Arab authors it is called *rooman*, and by the Persians *anar*, and it is probably indigenous all along the mountains from the Caucasus to the Himalayas, where it is described by Dr. Royle as being found in a wild state. Forster describes the pomegranate as being delicious in most parts of Persia; and Burnes states that the famous pomegranates without seeds are grown in gardens under the snowy hills near the Caubul river.

The pomegranate was well known to the Greeks, being the Roa of Theophrastus and the Roia of Dioscorides. Hippocrates mentions it by what is supposed to be its Phœnician name, *side*. By the Romans it was called Punica, and Punicum malum, from having been introduced from Carthage. Besides the fruit, the parts employed by the antients were the double flowers, which were called *balaustion;* the pericarp, from its leathery consistence, called *malicorium*, was used for its astringent properties; while the bark of the root was considered an efficient anthelmintic. In the East, where so much has remained stationary, the different parts continue to be employed for the same purposes; and Dr. Royle mentions that in India *buloositon* is given as the Greek name of the double flower. The rind of the wild fruit is much preferred for astringent purposes, and forms in the present day an article of commerce from the Himalayas to the plains of India. The bark of the root, being also still employed in India for the expulsion of intestinal worms, was made known as a recent discovery in India, in consequence of a Mohammedan practitioner having cured a European gentleman there of tape-worm with great ease. He had no doubt learned this property of the bark of pomegranate from the translations of Dioscorides, which are incorporated in most of the Mohammedan works on Materia Medica, affording a striking instance of facts once well known being forgotten until they are rediscovered. It is remarkable that the African slaves in the West Indies are also acquainted with this property of the root of the pomegranate, which they must have learned in their own country, probably from the prevalence there of Mohammedan works on medicine, or of the practice which is inculcated in them.

PUNISHMENT. The verb *to punish* (whence the noun substantive *punishment*) is formed from the French *punir*, according to the same analogy as *furnish* is formed from *fournir*, *tarnish* from *ternir*, *finish* from *finir*, &c. The French *punir* is derived from the Latin *punire*, antiently *poenire*, which is connected with *poena* and the Greek *poinè* (ποινή). Poinè signified a pecuniary satisfaction for an offence, similar to the *wergeld* of the German codes: *poena* had doubtless originally a similar sense; but in the Latin classical writers its meaning is equivalent to that of our word *punishment*.

Punishment may be inflicted on men by a supernatural being or by men; and it may be inflicted on them either in the present life, or in the existence which commences after death. Punishment may likewise be inflicted by men on the more intelligent and useful species of animals, such as horses and dogs. In the following remarks, we confine ourselves to punishment inflicted by man on man in the present life.

The original idea of punishment was, pain inflicted on or endured by a person as a satisfaction or atonement by him for some offence which he had committed. (Grimm, *Deutsche Rechtsalterthümer*, p. 646.) According to this conception of punishment, it appeared to be just that a person should suffer the same amount of pain which he had inflicted on others by his offence; and hence the origin of the retaliatory principle of punishment, or the *lex talionis*. This principle is of great antiquity, and is probably the earliest idea which all nations have formed concerning the nature of punishment. It occurs among the early Greeks, and was attributed by them to their mythical prince and judge of Hades, Rhadamanthys. They embodied it in the following proverbial verse:—

εἴ κε πάθοι τά κ' ἔρεξε, δίκη κ' ἰθεῖα γίνοιτο.
(Aristot., *Eth. Nic.*, v. 8.)

The *talio* was also recognised in the Twelve Tables of Rome (*Inst.*, iv. 4, § 7), and upon it was founded the well-known provision of the Mosaic law, 'an eye for an eye, and a tooth for a tooth:' a maxim which is condemned by the Christian morality. (*Matth.*, v. 38-40; and Michaelis, *Commentaries on the Laws of Moses*, vol. iii., art. 240-2.)

The infliction of pain for the purpose of exacting a satisfaction for an offence committed is *vengeance*, and punishment inflicted for this purpose is *vindictive*. [ANGER.]

By degrees it was perceived that the infliction of pain for a vindictive purpose is not consistent with justice and utility, or with the spirit of the Christian ethics; and that the proper end of punishment is not to avenge past, but to prevent future offences. (Blackstone's *Commentaries*, vol. iv., p. 11.)

This end can only be attained by inflicting pain on persons who have committed the offences; and as this effect is also produced by vindictive punishment, vindictive punishment incidentally tends to deter from the commission of offences. Hence Lord Bacon justly calls revenge a sort of wild justice. [ANGER.]

But inasmuch as the proper end of punishment is to deter from the commission of offences, punishment inflicted on the vindictive principle often fails to produce the desired purpose, and moreover often involves the infliction of an unnecessary amount of pain. Thus when an offence is expunged from the criminal code, all persons suffering punishment for it ought at once to be pardoned; inasmuch as their punishment cannot produce any preventive effect. Again, the degree of the punishment will often be placed too high, if regard is had merely to the suffering produced by the offence in the individual case, or to the moral turpitude implied by it, and not to the facility or difficulty of prevention, or the mischievousness of the class of offences. All punishment is an evil, though a necessary one. The pain produced by the offence is one evil; the pain produced by the punishment is an additional evil; though the latter is necessary, in order to prevent the recurrence of the offence. Consequently a penal system ought to aim at economising pain, by diffusing the largest amount of salutary terror, and thereby deterring as much as possible from crimes, at the smallest expense of punishments actually inflicted; or (as the idea is concisely expressed by Cicero), 'ut metus ad omnes, pœna ad paucos, perveniret' (*Pro Cluentio*, c. 46).

It follows from what has been said, that it is essential to a punishment to be *painful*. Accordingly, all the known punishments have involved the infliction of pain by different means, as death, mutilation of the body, flogging or beating, privation of bodily liberty by confinement of various sorts, banishment, forced labour, privation of civil rights, pecuniary fine. The punishment of death is called *capital* punishment: other punishments are sometimes known by the name of *secondary* punishments. Moreover, the pain ought to be sufficiently great to deter persons from committing the offence, and not greater than is necessary for this purpose.

A punishment ought further to be, as far as the necessary defects of police and judicial procedure will permit, *certain*; and also, as far as the differences of human natures and circumstances will permit, *equal*.

If a punishment be painful, and the pain be of the proper amount, and if it be likewise tolerably equal and certain, it will be a good punishment.

The qualities just enumerated are those which it is most important that a punishment should possess. But it is sometimes thought desirable that a punishment should possess other qualities than those which we have enumerated.

1. Since the time when it has been generally understood that punishment ought not to be inflicted on a vindictive principle, the deterring principle of punishment (which necessarily involves an infliction of pain) has been sometimes overlooked, and it has been thought that the end of punishment is the reformation of the person punished. This view of the nature of punishment is erroneous in excluding the exemplary character of punishment, and thus limiting its effects to the persons who have committed the offence, instead of comprehending the much larger number of persons who may commit it. The reformation of convicts who are suffering their punishment is an object which ought to enter into a good penal system; but it is of subordinate importance as compared with the effect of the punishment in deterring unconvicted persons from committing similar offences.

2. It is likewise sometimes thought that punishment is inflicted for the purpose of getting rid of offenders, or of rendering them physically incapable of repeating their offence. Death has often been inflicted for this purpose; and bodily disablements of different sorts have been inflicted for the same end; transportation has likewise been often recommended on the ground of its getting rid of convicts. This view of punishment errs in the same manner as that just examined; inasmuch as it is confined to the persons who have actually committed offences. If all offenders were removed to a place of reward, they would be got rid off, but not punished. The principle of getting rid, or confinement, for the purpose of protecting society against the known dangerous tendencies of a person, is properly applicable in the case of madmen. It may also be rarely employed with advantage in the case of mischievous political adventurers and conquerors; as *e.g.* Napoleon Bonaparte.

A detailed account of the punishments which have been used in different nations may be found in different works on antiquities and law books. See, for the Greeks, Wachsmuth's *Greek Antiquities*, vol. ii., part 1, p. 181; Hermann's *Greek Antiquities*, § 139; for the Romans, Haubold's *Lineamenta*, § 147; for the antient Germans and for Europe generally in the middle ages, Grimm's *Deutsch. Rechtsalterthümer*, b. v., ch. 3; for modern France, *Le Code Pénal*, liv. 1; and for England, Blackstone's *Commentaries*, vol. iv.

The subject of *Secondary Punishments* (the principal of which are in this country transportation and imprisonment), is treated under TRANSPORTATION. We will here make a few remarks on the subject of *Capital Punishments*.

An idle question is sometimes raised as to the right of a government to inflict death as a punishment for crimes, or, as it is also stated, as to the lawfulness of capital punishment. That a government has the power of inflicting capital punishment cannot be doubted; and in order to determine whether that power is rightfully exercised, it is necessary to consider whether its infliction is, on the whole, beneficial to the community. The following considerations may serve to determine this question respecting any given class of crimes. Death is unquestionably the most formidable of all punishments; the common sense of mankind and the experience of all ages and countries bear evidence to the truth of this remark. Moreover, capital punishment effectually gets rid of the convict. It may be added, as subordinate considerations, that death is the cheapest of all punishments, and that it effectually solves all the difficult practical questions which arise as to the disposal and treatment of convicted criminals. On the other hand, capital punishment, from its severity and consequent formidableness, is likely to become unpopular; and hence, from the unwillingness of judges and juries to convict for capital offences, and of governments to carry capital sentences into effect, uncertain. Whenever the infliction of capital punishments becomes uncertain, their efficacy ceases, and they ought to be mitigated. An uncertain punishment is not feared, and consequently the pain caused by its actual infliction is wasted. Capital punishments ought therefore to be denounced only for crimes which could not be effectually prevented by a secondary punishment, and for which they are actually inflicted with as much constancy as the necessary defects of judicial procedure will allow.

The writings on the subject of punishment, and particularly of capital punishment, are numerous. Beccaria's well known treatise first, with Voltaire's assistance, diffused more rational views on the subject throughout Europe; but it cannot be read with much profit at the present time. The best work on the subject is Bentham's *Théorie des Peines*, edited by Dumont. Some valuable remarks on the subject of punishment may likewise be found in the recent writings of Archbishop Whately and others respecting transportation.

PUPA. In entomology, this term is applied to the third stage of existence of an insect, the egg being the first stage, and the larva or caterpillar, the second. A caterpillar, from the time that it leaves the egg until it is full-grown, frequently casts its skin; and the necessity for this change arises from the circumstance that the soft skin of the animal rather stretches than grows between the times of moulting; and as the horny parts, such as the head, parts of the mouth, legs, &c., cannot stretch, they become out of proportion; and, unless they were changed for larger parts, the insect could never attain its proper size.

There are certain times in which a caterpillar is comparatively torpid; cannot eat, and with difficulty moves. During this time a new set of parts are rapidly forming beneath the old ones (which prevents their being used); and when these are perfected, the old covering, or skin, including that of the head, legs—in fact, of all the external parts, and even the lining of the intestinal canal and of the breathing openings —is cast off. Previous to this shedding of the skin, as before stated, all the hard parts are proportionately small, and the soft skin is stretched to its utmost; but after the moult, the new skin is loose, and the horny parts are proportionately large. When the caterpillar has thus, by a series of moults, attained its full size, it again casts its skin; but instead of keeping the caterpillar form, we find the animal much changed in appearance: it has in fact assumed the pupa state. In this pupa we can trace most of the parts of the caterpillar with an addition of other parts (in a more or less rudimentary state) which are peculiar to the perfect insect. The pupa is at first soft (and is filled with a watery fluid); but, in many instances, the skin soon becomes hardened, as in the pupa, or chrysalis, state of the Lepidopterous insects.

'From the swathed appearance of most insects in this state' (say Messrs. Kirby and Spence), 'in which they do not badly resemble in miniature a child trussed up like a mummy in swaddling-clothes, according to the barbarous fashion once prevalent here, and still retained in many parts of the Continent, Linné has called it the pupa state, and an insect when under this form, a *pupa*. In this state most insects eat no food; are incapable of locomotion; but there are differences in the various orders which are worthy of attention. The most perfect transformation, perhaps, takes place in the Hymenopterous insects; that is to say, there is more difference between the larva and perfect or imago state of these insects, than in other tribes; and as one of the peculiar characteristics of the insect tribe consists in their transformation, this fact, in conjunction with others, would lead one to place that order at the head of the insect tribe. The larva of an Hymenopterous insect is a legless maggot, and has consequently very little power of locomotion: in the pupa state, all the parts are enclosed in a thin membrane; and although they are applied closely to each other, they are not glued, as it were, as in the case of the pupæ of Lepidopterous insects; neither does the thin skin which covers the Hymenopterous pupæ harden to that degree as we observe it in the insects just mentioned, owing probably to their being for the most part better protected from the inclemencies of the weather, partly by the situations in which they are placed, and partly by being enclosed in a silken cocoon spun by the larva immediately previous to its transformation. The pupæ of the Coleopterous insects resemble those just described; they constitute what Aristotle called *Nymphæ*, and are now most frequently termed *incomplete* pupæ.'

'Butterflies, moths, and some of the two-winged tribe,' say the authors before quoted, 'are, in their pupa state, also enclosed in a similar membranous envelope; but their legs, antennæ, and wings are closely folded over the breast and sides, and the whole body enclosed in a common case or covering of a more horny consistence, which admits a much less distinct view of the organs beneath it. As these pupæ are often tinged of a golden colour, they were called from this circumstance *chrysalides* by the Greeks, and *aureliæ* by the Romans, both of which terms are in some measure become Anglicised; and, although not strictly applicable to tinge-less pupæ, are now often given to those of all Lepidopterous insects. These by Linné are denominated *obtected* pupæ.'

The differences however between the *obtected* pupæ and the incomplete pupæ are not so great as would appear from the passage just quoted; they are only differences of degree. We have reason to believe the parts are not all enclosed in one common integument, but that the legs, antennæ, and wings each have a sheath: that side which is not exposed differing only in being thinner. In the orders *Hemiptera*, *Orthoptera*, and many of the *Neuroptera*, the pupæ are active, and differ only from the larvæ in possessing rudimentary wings. In some cases the perfect insects of these orders have no wings, and it is difficult, if not impossible, to distinguish the stages:—Here there is an approach made towards the *Crustacea*, but in the true insects the skins are never shed after they have attained maturity, whereas in the *Crustacea* the integument is cast even after the species have the power of propagation. The necessity for moults is the same in both cases; the shell of the crab, like the integument of an insect, having no power of growth after its first formation.

It has been stated that insects immediately previous to their moult are inactive; but there is much difference in the duration of this state, and this difference appears in a measure proportionate to that which exists between the insect before and after the moult. The caterpillar of the butterfly or moth is a considerable time inactive before it changes into the pupa state, whereas when the change is not so great, the time in effecting that change is less.

To the various kinds of pupæ already mentioned may be added one other, termed by Linné the *coarctate* pupa. These are peculiar to the insects belonging to the order Diptera. These pupæ are not, as in other instances, excluded from the skin of the larva, but remain concealed under it: the skin of the larva in fact forms a kind of protecting cocoon. Where the pupæ resemble the larva and perfect insect, except in possessing rudiments of wings, as in most of the *Orthoptera* and *Hemiptera*, they are termed by Linnæus *semi-complete* pupæ; and lastly, where the pupæ do not differ from the perfect insect, as in the lice tribe, they are called *complete* pupæ. These terms are however of but little use; there are in fact only two essential differences in the pupæ of insects, and they may be expressed by the terms *active* and *inactive*; the active pupæ being those which walk about. The terms given by Linnæus, and applied by Messrs. Kirby and Spence and other authors, to all the trifling modifications of pupæ, we think have a tendency to prevent generalizations by creating a prejudiced idea of differences greater than those which in reality exist. Besides this, the science is already overburthened with technicalities.

PUPA. (Conchology.) [HELIX, vol. xii., p. 106, 107, 110.]

PUPIE'NUS, CLODIUS PUPIENUS MAXIMUS, an officer of rank in the Roman army, was elected emperor by the senate conjointly with Balbinus, after the death of the two Gordians, in opposition to the usurper Maximinus, A.D. 240. After a reign of about a twelvemonth, he was killed, together with his colleague, in an insurrection of the Prætorians at Rome. Further details concerning these events are given under BALBINUS.

Coin of Pupienus.
British Museum. Actual Size.

PUPIL. [EYE.]

PUPIL, ARTIFICIAL. The operation of forming an artificial aperture in the iris is required in a variety of cases in which the passage of light through the natural pupil to the deeper seated parts of the eye is obstructed; and to meet the different exigencies of these several cases a variety of operations have been suggested, each of which in its turn deserves to be preferred. The chief of these are—1, the tearing away a portion of the iris from its attachment to the ciliary ligament [EYE], a method which is however now very rarely employed; 2, the making a simple incision through some part of the iris, by the retraction of whose edges an elliptical or circular aperture is produced; 3, the making a portion of the iris protrude through an aperture in the cornea, and cutting it off. In whatever way the operation be performed, it is necessary to make the aperture in the iris as large as possible, that when it contracts in the process of cicatrization, it may not be too small to permit the passage of a sufficient quantity of light for useful vision.

PUPI'VORA. In entomology this term is applied by Latreille to his second great section of hymenopterous insects—a section the species of which are distinguished by their having the abdomen attached to the thorax, in most cases, by a slender stalk, and not, as in the first section (*Securifera*), forming as it were a continuation of the thorax. The females are furnished with a slender bristle-like ovipositor, and in this respect they also differ from the greater portion of the *Securifera*.

The larvæ of the *Pupivora* have no feet, and most of them are parasitical. Latreille divides this section into two groups, the *Evaniales* and the *Ichneumonides*, distinguished chiefly by the insertion of the stalk or basal portion of the abdomen. In the *Evaniales* the stalk is attached to the thorax, and in most cases immediately under the scutellum: they have distinct nervures to the wings, and those of the upper pair form cellules; the antennæ are filiform, or setaceous, and composed either of thirteen or fourteen joints; the mandibles are toothed on the inner side; the maxillary palpi have six joints, and the labial four; the ovipositor is generally exserted, and composed of three slender pieces.

Dr. Leach regarded the present group as constituting a family, and applied to it the name *Evanidæ*; compared with the next section of the *Pupivora*, the present one is very limited in species. Mr. Stephens, in his 'Systematic Catalogue of British Insects,' only enumerates five species, and these constitute three genera, *Evania*, *Brachygaster*, and *Fœnus*.

In the *Ichneumonides* the abdomen has its origin between the two posterior legs; the nervures of the upper wings form cellules; the antennæ are generally filiform or setaceous, and composed of many joints (sixteen at least); the mandibles are in most cases destitute of denticulations on the inner side, and are bifid at the apex; the maxillary palpi are always distinct, and seldom have more than six joints. Of this group the species are exceedingly numerous. Mr. Stephens states that he possesses 800 British species of this family. The *Pupivora* appear to be destined to prevent other tribes of insects (particularly the *Lepidoptera*) from becoming numerous.

The *Ichneumonidæ* may be seen during the summer months in great numbers flying from plant to plant in search of the caterpillars which are suited to furnish the proper food and to rear their larvæ, each caterpillar apparently having its own peculiar parasite, or parasites, for sometimes several species of ichneumon attack the same larvæ. The female ichneumon, by means of her long bristle-like ovipositor, inserts her eggs into the body of the caterpillar in such a manner, and in such parts, that it does not destroy the life of the victim. In most cases these eggs are not hatched until the caterpillar has changed into a chrysalis; they then hatch, and the ichneumon larvæ feed upon the contents of the pupa case, enclose themselves in silken cocoons, and undergo their final transformations, to come forth in proper season, eating their way through the chrysalis case. Instances are not uncommon in which the eggs of the ichneumon hatch in the body of the living caterpillar, and, what is most remarkable, they do not destroy its life. It is not until the larvæ have quitted their abode in the caterpillar that it dies, having the cocoons of the ichneumon larvæ attached to its skin. The caterpillar so abundant on cabbages, and which is that of the common white butterfly, affords a familiar example of this nature. At certain times of the year numbers of those caterpillars may be seen on walls adjoining gardens: on these they usually attach themselves (in some sheltered situation) to undergo the transformation into the pupa state. One of these caterpillars will appear healthy, select a convenient situation, attach itself (as usual before the change into the pupa state) by means of a silken thread around its body, but instead of undergoing the transformation, we shall find it after a short time covered with an immense number of small yellowish silken cocoons spun by the larvæ of the ichneumons as they crawl from its body. These cocoons, which are about one-eighth of an inch in length, are attached to each other, and to the skin of the caterpillar, which then dies. The larvæ of some of the *Ichneumonidæ* themselves are infected with parasites.

For the characters of the various subdivisions of this extensive group of insects, and for descriptions of the species, the reader is referred to the 'Conspectus Generum et Familiarum Ichneumonum,' by J. L. C. Gravenhorst.

PURANAS. [SANSCRIT LITERATURE.]

PURBACH, GEORGE, so called from the name of his birth-place, Peurbach, a village on the confines of Bavaria and Austria, and about twenty-four miles west from Linz, was born in the year 1423. His family name appears to be unknown. Montucla informs us that he became a pupil of Gmunden, who taught astronomy in the university of Vienna; that he afterwards visited the principal seats of learning in Europe, in order to acquaint himself with those who cultivated astronomy; and that on his return he succeeded his master Gmunden, notwithstanding very strong solicitations to fix his residence at Bologna and Padua. He constructed many astronomical instruments, among which is an application of the plumb-line to a graduated circle; and he computed several trigonometrical tables, including a table of sines for every ten minutes of the quadrant, which his pupil Muller afterwards extended to each minute: but he is now chiefly remembered on account of the part he took in the translation and elucidation of the 'Almagest' of Ptolemy.

Printing, observes Delambre, had not then been applied to the diffusion of mathematical knowledge. The Greek manuscript of Ptolemy was then unknown in Europe, and the only works whence a knowledge of astronomy could be derived were two Latin versions of the 'Almagest' (translated from the Arabic), both of which were in many places incorrect, and more frequently altogether unintelligible, an imperfect Latin version of Albategnius; one of Alfragan; and a treatise on the sphere, by Sacrobosco, which last contained a few elementary notions relating to the phenomena of the diurnal motion and eclipses. Manuscripts were scarce, and those who could procure them were, for the most part, soon discouraged by the difficulties they encountered in their perusal of Ptolemy, and still more by the prolixity of his interminable calculations. It cannot therefore be a matter of surprise that those whose perseverance had in some measure surmounted these obstacles should enjoy a high reputation, and that their assistance should be eagerly sought after by others. Such was the case with Purbach. His ignorance of the Greek language would have precluded his reading the 'Almagest' in the original, had it been in his possession; but he had read the Latin translations of it, and after relieving them of their geometrical reasoning and tedious calculations, he endeavoured to explain the Ptolemaic system, not to those who wished to become astronomers, but to those who would be contented with a general notion of the mechanism of the phenomena and the arrangement of the heavenly bodies. The most difficult part was the theory of the planets, concerning which Sacrobosco was silent. Purbach made it the subject of a book, which was not published till 1488, twenty-seven years after his death, when it appeared at Venice appended to a quarto edition of Sacrobosco's treatise on the sphere, under the title of 'Theoriæ Novæ Planetarum.' This work, which may be looked upon as an introduction to Ptolemy, passed through many editions, accompanied by as many different commentaries; from which we may infer, says Delambre, that the work itself was not what it ought to have been, but that it served as the text-book to most of the professors of the day.

A faithful translation of the 'Almagest' was still a desideratum among astronomers. Bessarion, who first introduced into Europe the text of Ptolemy and that of his commentator Theon, had himself commenced a new version, but unable to proceed with it, in consequence of his numerous political missions, he addressed himself to Purbach, whom he persuaded to undertake the task. Our authority (Delambre), who does not say how Purbach qualified himself to translate from the Greek, adds, that when he had completed the earlier books, he died, confiding the revision and further prosecution of the work to his friend and pupil Muller. According to Montucla, Purbach was advised by Bessarion to acquaint himself with the language of Greece by revisiting Italy, where the literature of Greece was at that time much cultivated, and that his death took place suddenly when on the point of taking his departure from Vienna for that purpose. This work, which after

-'age' but an abridgment of the original, was completed by Müller, under the title of 'Joannis de Monteregio et Georgii Purbachii Epitome in Cl. Ptolemaei Magnam Compositionem,' &c., and published by him at Basle in 1543. An analysis of its contents will be found in the 'Histoire de l'Astronomie du Moyen Age,' pp. 282-292; but any further notice of it belongs to the article REGIOMONTANUS.

Peurbach died at Vienna, April 8, 1461, in the thirty-eighth year of his age. His remains were interred in the cathedral of that city, where a Latin epitaph indicates his tomb.

His published works not already mentioned are: 1, 'Tabulae Eclipsium,' fol., Vien., 1514, in which is given a list of his unedited manuscripts; 2, 'Elementa Arithmetices,' 4to., Vien., 1536; 3, 'De Sinibus,' Nürnb., 1541; 4, 'De Quadrato Geometrico,' Nürnb., 1516.

(*Georgii Peurbachii et Joannis Mulleri Regiomontani Vitae, Authore Petro Gassendo*, Hagae, 1655, 4to.; Montucla, *Hist. des Math.*; *Biog. Univers.*, article 'Peurbach,' by Delambre; Hutton's *Dictionary*, &c.)

PURCELL, HENRY, the pride and boast of the English school of music, was born in the year 1658, in the city of Westminster, it is generally supposed. His father Henry, and also his uncle Thomas Purcell, were appointed gentlemen of the chapel-royal at the Restoration, and are named, in the archives of the heralds' college, among the persons who officiated at the coronation of Charles II. The young Henry lost his father when but six years of age, about which time he appears to have entered as one of the children of the chapel under Captain Cook, then master, to whom therefore it is rather more than probable he was indebted not only for his initiation in the principles of music, but for much of his knowledge in its practice, and of its theory as applicable to composition. It is true that on Dr. Blow's monumental tablet in Westminster Abbey, it is triumphantly recorded that he was 'master to the famous Mr. Henry Purcell,' and no doubt the youthful musician, when he quitted the chapel on his voice changing, received some instructions from Blow, a master then in high repute, and from whom a few lessons were enough to recommend to public notice a young man on his entrance into the world; but to Cook the credit is due for the right guidance of Purcell's inborn genius, and for its early cultivation. Sir John Hawkins says, 'it is certain that he was a scholar of Pelham Humphrey, who was Cook's successor,' but gives no authority for this, and assigns no reason for his belief. Humphrey became master of the children in 1672, when Purcell had attained his fourteenth year, who consequently could not have remained long, if at all, under the tuition of the new master. Cook therefore must not on such doubtful evidence be deprived of the praise to which he is entitled for his large share in the education of our great English composer. But, as Dr. Burney has well remarked, 'there is nothing more common than this *petit larceny* among musicians. If the first master has drudged eight or ten years with a pupil of genius, and it is thought necessary, in compliance with fancy or caprice, that he should receive a few lessons from a second, this last instantly arrogates to himself the whole honour both of the talents and cultivation of his new scholar, and the first and chief instructor is left to sing *sic vos non vobis*.'

Purcell was remarkable for precocity of talent, and seconded the liberality of nature by his zeal and diligence. While yet a boy-chorister he composed more than one anthem; and in 1676, though only eighteen years of age, was chosen to succeed Dr. Christopher Gibbons as organist of Westminster Abbey, an appointment of high professional rank. Six years after, in 1682, he became one of the organists of the royal chapel, and there, as well as at the Abbey, produced his numerous anthems, many of which appear in different collections, and nearly all of them have recently been published in one complete work. These were eagerly sought, almost as soon as written, for the use of the various cathedrals, and thus his fame quickly travelled to the remotest parts of England and Ireland. Had Purcell confined himself to church music only, he would have stood on very lofty ground as compared with either his predecessors or contemporaries, and his works would have been transmitted with honour to after-ages; but the greatness of his genius is most conspicuous in his compositions for the chamber and the stage. In these the vividness of his imagination and the fertility of his invention appear in all their brilliance, because unrestrained by the character of the poetry to which he gave musical expression, and unencumbered by what is termed musical erudition, a kind of learning which time (even a century and a half ago) and a laudable feeling of veneration had rendered an almost necessary attribute of cathedral harmony. The versatility of his talent and the division of his labours between the church and the theatre, led his facetious friend Tom Brown, in his 'Letters from the Dead to the Living,' to say that musical man 'hung between the church and the playhouse, as Mahomet's tomb does between the two loadstones, and must equally incline to both, because by both are equally supported.'

Purcell's first essay in dramatic music, when only nineteen years of age, was his setting the songs, &c. in Nahum Tate's 'Dido and Æneas,' an operetta written for a boarding-school of celebrity. In this is the simple and beautiful duet, 'Fear no danger,' once sung everywhere and by everybody, but now almost forgotten. The music in Nat. Lee's 'Theodosius, or the Force of Love,' performed at the Duke's theatre, in 1680, was his first work for the public stage. In the same year he set new music to 'The Tempest,' as altered by Dryden, which is still heard with delight, and also the 'Prophetess, or Dioclesian,' altered by Dryden and Betterton from Beaumont and Fletcher. In 1691 he composed the songs, &c. in Dryden's 'King Arthur,' among which are the inimitable frost-scene, the very original and lovely air, 'Fairest Isle,' and the charming duet, 'Two daughters of this aged stream are we.' In 1692 appeared Sir R. Howard's and Dryden's 'Indian Queen,' with Purcell's music. The fine incantation scene in this, 'Ye twice ten hundred deities,' is yet often heard in good concerts, but never in tolerable ones. The duet and chorus, 'To arms,' and the air, 'Britons, strike home!' in Dryden's alteration of 'Bonduca,' are national property—are our war-songs, always received with acclamations when we are engaged in or menaced by hostilities, and frequently performed during peace on account of their beauty, musically considered. These alone will suffice to carry Purcell's name to distant ages. His music in D'Urfey's 'Don Quixote' is remarkably appropriate and clever; the song, 'Genius of England,' has few rivals, and the cantata, 'Let the dreadful engines of eternal will,' sung in the character of the love-distracted Cardenio, is, with the exception of the latter part (now very wisely omitted in the performance), one of the composer's finest creations. He also wrote airs, overtures, and act-tunes for many dramas, among which may be mentioned Dryden and Lee's 'Œdipus,' 'Timon of Athens,' 'The Fairy Queen,' altered from 'A Midsummer-night's Dream,' and Dryden's 'Tyrannic Love, or the Royal Martyr.' [OPERA, p. 442, vol. 1.]

The three detached cantatas by Purcell are undeniable proofs of his fancy, energy, and deep feeling. It is sufficient to name 'Mad Bess,' 'Old Tom of Bedlam,' or 'Mad Tom' (the words by Mr. William Basse, Walton tells us, in his 'Angler'), and 'From rosie bowers,' written by Tom D'Urfey, but *not* originally sung in 'Don Quixote,' as Percy seems to think. So well known are these, so highly valued by true connoisseurs, and so much admired by all lovers of music, that one more word in their praise would be superfluous. Our limits will not allow us to enter into any account of, or even to name, his many single songs and duets. After the composer's death they were collected by his widow, and published in two folio volumes, under the title of 'Orpheus Britannicus,' the second and best edition of which is now very rare. His odes, glees, catches, and rounds are numerous, and several of them familiar to the admirers of vocal harmony. In 1683 he published twelve sonatas for two violins and a base. In the preface he says that 'he has faithfully endeavoured a just imitation of the most famed Italian masters, principally to bring the seriousness and gravity of that sort of music into vogue and reputation among our countrymen, whose humour 'tis time now should begin to loathe the levity and *balladry* of our neighbours.' Purcell's esteem for the Italian masters had been before confessed in the dedication of his 'Dioclesian' to the duke of Somerset, wherein he modestly remarks, 'Poetry and painting have arrived to their perfection in our country: music is yet but in its nonage, a forward child, which gives hope of what it may be hereafter in England, when the masters of it shall find more encouragement. 'Tis now learning Italian, which is its best master, and studying a little of the French air to give it somewhat more of gayety and fashion. Thus being farther from the sun, we are of later growth than our neighbouring countries, and must be content to shake off our barbarity by degrees.' Here he does justice to the French school, by which he had certainly profited, though in a perfectly fair manner.

Two years after his decease his widow printed the overtures, act-tunes, &c. before mentioned, under the title of 'A Collection of Ayres composed for the Theatre, and on other occasions,' &c. They are in four parts, and continued in use in Dr. Burney's time, till superseded by Handel's concertos and other newer compositions.

We have above alluded to Purcell's compositions for the church, and as regards these must add a few remarks. His published anthems amount in number to upwards of fifty; and to these are to be added a *Te Deum* and *Jubilate* with orchestral accompaniments,—a complete Service, several hymns, motets, and sacred songs. Some of his anthems, especially those in Dr. Boyce's Collection, are still in use in our cathedral and other choirs, and never can be allowed to fall into neglect while the influential persons in those venerable establishments possess any musical discernment. His *Te Deum* and *Jubilate*, to which the epithet 'grand' is the usual prefix, is a work that has seldom if ever been spoken of but in terms of unqualified panegyric. That it evinces many traits of originality—that it displays a vast deal of scientific skill—that an easy, pleasing melody runs through portions of it—and that it has also the merit of being the first of the kind ever produced in this country, cannot be denied: but, on the other hand, there is in its general structure a want of suitable grandeur,—mainly arising from the frequent occurrence of mean passages of pointed, jerking notes in the vocal parts, that take from it much of the solemnity which the subject demands; and these, together with certain divisions that disconnect the words and obscure the sense, produce an effect not only undignified, but nearly bordering on the ridiculous. Besides these greater defects, there are in the work some others of less importance, such as a few conceits, some harsh notes, and occasional errors in accentuation and emphasis. The best excuse for the composer is, that most of the errors we have ventured to point out were common at the time they were committed. Still they are errors, and of magnitude, and should have kept within moderate bounds that warmth of feeling which has led to such unreserved encomiums on what, in our opinion, is by no means to be reckoned among the best of the composer's works.

Purcell died in November, 1695, of consumption, Hawkins surmises; and it is to be wished that this always industrious and sometimes over diligent historian had not snatched from the oblivion to which it ought to have been consigned, a 'tradition' that his death was occasioned by a cold caught in an inclement night, waiting for admittance into his house, Mrs. Purcell having 'given orders to his servants not to let him in after midnight.' We regret to say that this exceedingly improbable story has lately been revived, without the slightest attempt at proof, accompanied by vituperative expressions most injurious to the memory of one who, if we may judge from her language in the dedication to the *Orpheus Britannicus*, was an attached, faithful wife, and incapable of the cruelty alleged against her. Purcell's habits, Hawkins states, were of the most convivial kind, and led him too frequently into the society of 'the witty Tom Brown,' together with other persons of irregular lives; and thus were, most likely, sown the seeds of a disease which at so early a period terminated a life of such inestimable value.

The remains of this great musician lie in the north transept of Westminster Abbey: on a pillar near the spot is a tablet, placed there by the Lady Elizabeth Howard, on which is the subjoined inscription, commonly attributed to Dryden:—

'Here lies
HENRY PURCELL, Esq.,
who left this life,
and is gone to that blessed place
where only his harmony can be exceeded.
Obiit 21mo. die Novembris,
Anno ætatis suæ 37mo.,
Annoq. Domini, 1695.'

On the stone over his grave was a Latin epitaph, now entirely effaced. The original and a translation are both given by Hawkins and Burney. Among the works of Dryden is an epitaph on the death of his friend Purcell, but it cannot be viewed as one of the happiest of the great poet's efforts. Sheffield, Duke of Buckingham, wrote an ode on the same occasion, in which are some noble thoughts concerning the desire of posthumous fame. It concludes with the following praise of the art in which our British composer signalised himself:—

'Music exalts man's nature, and inspires
High elevated thoughts, or gentle kind desires.'

We shall conclude this notice by repeating the substance of some remarks made by us elsewhere a few years ago. Purcell, take him for all in all, is the greatest musical genius this country ever produced; and our deliberate opinion is, that, from the earliest period in the history of the art, down to the time of his death, Europe would in vain be searched to find his equal as a composer of secular music. That he was to some extent indebted to Lulli will hardly be denied; but that he far surpassed what, perhaps in compliment to our second Charles, and to the taste of the time, he occasionally took as his model, every impartial critic must admit. If too his cantatas be compared with compositions in a degree similar, by Alessandro Scarlatti, which have been so highly praised, and so long were vaunted, the vast superiority of the English musician, whether as relates to air, to harmony, to variety of expression, or to beauty of effect, will never be disputed by unbiassed judges. He certainly was not wholly guiltless of the faults of the age in which he lived; or, perhaps, was obliged sometimes to yield his better judgment to the tyrannical demands of custom or of fashion; yet some of his ecclesiastical and most of his secular music, written under the influence of his own feeling, and uncontrolled by the necessity of submitting to the taste of the great and small vulgar, is so rich in melody, so expressive of the depth and energy of true passion, that all who understand the English tongue, who have acquired some knowledge of the language of music, and have no governing predilection for any particular school, confess his power, and admit the originality and vigour of his genius.

PURCHAS, SAMUEL, was born at Thaxted in Essex, in 1577. He was educated at Cambridge, and though Wood says that he could not ascertain at what college or hall, it appears from his own testimony that he was a member of St. John's College; for in speaking of this college he says, 'Where also the author first conceived with this travelling genius, whereof without travelling he hath travelled ever since.' (*Pilgrimmes*, part iii.; *Dedication to Lord Keeper Williams*.)

In 1604 Purchas was instituted to the vicarage of Eastwood in Essex, but he soon left this cure to a brother, and went to live in London for the sake of greater advantages in preparing and printing the collection of travels which he had begun to make. In July, 1615, he was incorporated bachelor of divinity at Oxford, as he stood at Cambridge, having previously been collated by the favour of Dr. John King, bishop of London, to the rectory of St. Martin's Ludgate, in London. He also became chaplain to archbishop Abbot, but he never obtained higher preferment. By the publication of his books he brought himself into debt, and it was reported that he died in prison; but Wood affirms that he died in his own house a little while after the king (Charles I.) had promised him a deanery, about 1628, aged fifty-one.

The works of this author are the following:—1, 'Purchas his Pilgrimage, or Relations of the World, and the Religions observed in all Ages, and Places discovered, from the Creation unto this present,' 1 vol. fol., 1613, 1614, 1617, 1626. The materials of this work he borrowed, as he says, of above thirteen hundred authors of one or other kind, in he knew not how many hundredths of their epistles, treatises, and relations. (*Dedication to Archbishop Abbot*, prefixed to fourth edition.) 2, 'Purchas his Pilgrimmes,' in four parts or vols., fol., 1625, each volume containing five books. The difference between these volumes and the former publication may be best shown in his own words: 'These brethren holding much resemblance in name, nature, and feature, yet differ in both the object and subject. This (the 'Pilgrimage') being mine own in matter, though borrowed, and in form of words and method; whereas my Pilgrims are the authors themselves, acting their own parts in their own words, only furnished by me with such necessaries as that stage further required, and ordered according to my rules.' (*Dedication*, as above.) 3, 'Microcosmus, or the History of Man,' 8vo., 1619; 4, 'The King's Tower, and triumphant Arch of London,' 8vo., 1623; 5, 'A Funeral Sermon on Psalm xxxix. 5,' 8vo., 1619.

Of these five publications, the first two are best known, though they are now very scarce. They are curious, and in some respects valuable, and are probably the first works of the kind in our language. The dedications and prefaces particularly show that Purchas was an honest, a benevolent, and a pious man, and that he was of unwearied industry in performing his clerical duties, as well as in preparing his books for publication. He is described by a foreign writer, quoted by Wood, as 'an Englishman admirably skilled in languages, and human and divine arts, a very great philosopher, historian, and theologian, a faithful priest of his own church, very widely known for his many excellent writings, and especially for his large volumes pertaining to the East and West Indies.'

(Wood's *Fasti Oxonienses*; *Biog. Brit.*; the latter contains a good description of Purchas's two principal works.)

PURCHASE. [PROPERTY.]

PURGATION. [ORDEAL.]

PURGATORY ('a place of expiation,' from the Latin verb *purgare*, 'to cleanse') is the name given by Roman Catholics to an intermediate state of souls after death, and before the final judgment, during which they are supposed to expiate by certain punishments the guilt which they have incurred through life. Roman Catholic divines teach that it is only the souls of those who die in a state of repentance and in the communion of the church that are admitted into purgatory; those who die impenitent, or in a state of unbelief, are doomed to everlasting punishment. As for the duration of the term of expiation in purgatory, that is a matter which rests with divine justice, and varies according to the guilt of the parties, but Roman Catholics believe that the prayers of the living and other pious works may serve to shorten the term of souls in purgatory. This has given rise to the doctrine of indulgences, with which that of purgatory is closely connected. [INDULGENCE.] The Protestant and other churches which dissent from the church of Rome do not believe in purgatory. No mention of purgatory appears before the time of Augustin, who in some of his works speaks of it in terms not very explicit. The doctrine is said to have been first inculcated as a matter of belief by Gregory the Great, at the end of the sixth century. In the Council of Ferrara, A.D. 1438, which effected a temporary reconciliation between the Greek and Roman churches, the question of purgatory was discussed at length. Mark of Ephesus, on the part of the Greeks, stated the belief of his church in this respect to be that souls were sent after death to a place of darkness and mourning, but not of fire, where they remained for a season in affliction and deprived of the light of God. He admitted that alms and other pious works might shorten or mitigate their penance, but he held that even the saints or souls free from stain would not be admitted to perfect beatitude till the resurrection of their bodies at the final judgment.

PURITANS, a name first given in the reign of Queen Elizabeth to such clergymen of the church of England as declined to subscribe to its liturgy, ceremonies, and discipline, according to the requirements of the bishops in their respective dioceses. Fuller assigns the origin of this name to the year 1564, and Strype to the year 1569; but it seems not very easy to ascertain the exact date when any such name might have been first used. The clergymen so called were advocates for a further reformation than the existing authorities deemed it proper to sanction; they desired a form of worship more simple and pure than they believed that to be of the church as then established. They were called Puritans probably out of derision, and the name was shortly applied to the laity as well as to the clergy. This name in the time of Fuller evidently savoured more of contempt than it does at present; for he speaks of it as 'the odious name of Puritans; a name which in this notion first began in this year (1564); and the grief had not been great, if it had ended in the same. . . . We will therefore decline the word to prevent exception; which, if casually slipping from our pen, the reader knoweth that only non-conformists are thereby intended.' (*Church Hist. of Britain*, b. ix., p. 76, ed. 1655.) The Puritans were by other writers of the seventeenth century generally called non-conformists, a name first applied to men who objected to the clerical vestments about 1550. 'For now,' says Fuller, 'non-conformity in the days of King Edward was conceived; which afterwards, in the reign of Queen Mary (but beyond sea at Frankfort), was born; which, in the reign of Elizabeth, was nursed and weaned; which, under King James, grew up a young youth, or tall stripling; but, towards the end of King Charles's reign, shot up to the full strength and stature of a man, able not only to cope with, but conquer the hierarchy, its adversary.' (*Ibid.*, b. xi., sect. i. 23.) The reader is referred, for a general history of the Puritans, to the work of Neal, on the one hand, and, on the other hand, to the works of Strype and Collier. On the political influence exercised by the Puritans, Hallam's *Constitutional History of England* may be consulted. [DISSENTERS; NONCONFORMISTS.]

PU'RPURA. (Conchology.) [ENTOMOSTOMATA, vol. ix., p. 488.]

PURPURIC ACID. This substance was first prepared and described by Dr. Prout. When uric acid [URIC ACID] is gently heated with nitric acid diluted with about six times its weight of water, it dissolves with effervescence, and decomposition of the nitric acid. If the solution be evaporated with a gentle heat, it becomes, on drying, of a fine red colour, which disappears when it is dissolved in water. When this solution is saturated with ammonia the red colour is restored, and granular crystals of purpurate of ammonia, of a deep red colour, are deposited; when these are decomposed by hydrochloric acid, a yellow powder separates, which is purpuric acid; if however the salt, previously to decomposition, be treated with potash, then the ammonia is expelled, and sulphuric acid added separates colourless purpuric acid.

The properties of this acid are, that it is so little soluble in water, that one part requires 10,000 even of boiling water for solution; the solution is sometimes colourless and at other times pale red, or yellow, but no cause has been assigned for these variations. Purpuric acid is inodorous and insipid; it reddens litmus paper; neither alcohol nor æther dissolves it. It does not fuse when heated, but becomes red; when heated in the air, it burns without yielding any peculiar odour. When decomposed in a retort, it yields carbonate of ammonia, hydrocyanic acid, a small quantity of empyreumatic oil, and a pulverulent charcoal. Nitric acid dissolves it with effervescence, and converts it into oxalic acid. It dissolves in concentrated sulphuric acid, and water precipitates it from the solution. It is also soluble in boiling concentrated acetic acid; but neither citric, oxalic, nor tartaric acid dissolves it. Authors differ extremely as to the composition of this acid; the variation is indeed so great as scarcely to admit of the supposition that they can have operated on the same substance as analyzed by Dr. Prout. It has indeed been lately asserted by Fritzche, that the substance obtained by the action of acids on purpurates is not purpuric acid, but is principally *murexane* resulting from its decomposition.

We shall state the results of the analyses of Dr. Prout (1), Fritzche (2), and Kodweis (3), premising that we have seen the last stated only in symbols, and the results are adapted to the numbers employed in this work:—

(1)

Two equivalents of hydrogen .	4·54
Two equivalents of carbon .	27·27
Two equivalents of oxygen .	36·36
One equivalent of azote .	31·81
	99·98

(2)

Four equivalents of hydrogen .	1·6
Sixteen equivalents of carbon .	38·4
Ten equivalents of oxygen .	32·0
Five equivalents of azote .	28·0
	100·0

(3)

Six equivalents of hydrogen .	2·04
Eighteen equivalents of carbon	37·07
Twelve equivalents of oxygen	32·65
Six equivalents of azote .	28·24
	100·00

The salts of purpuric acid are termed purpurates; we shall state the properties of a few of these compounds, copied chiefly from Dr. Prout. This acid combines with the alkalis, alkaline earths, and metallic oxides, and is capable, with the assistance of heat, of decomposing the alkaline carbonates with effervescence.

Purpurate of Ammonia.—This salt is obtained by saturating the acid with the alkali; it crystallizes in quadrangular prisms, which, when viewed by transmitted light, are transparent, and of a deep garnet-red colour; but by reflected light, their two broadest opposite faces appear of a brilliant green, while their other two opposite faces appear of a dull reddish-brown colour, or, if the light be very strong, slightly green. This salt is soluble in about 1500 parts of water at 60°, but in boiling water is much more soluble; the solution is of a beautiful deep carmine or rose-red colour; it is inodorous, but has a slightly sweetish taste. Alcohol and æther dissolve this salt very slightly if at all. It does not appear to have been analyzed.

Purpurate of Potash.—According to Fritzche, this is best obtained by decomposing a boiling solution of purpurate of ammonia by means of excess of nitrate of potash. This purpurate consists of very small reddish-brown crystals; it may however be obtained in large crystals, which have the colour and lustre of the ammoniacal salt. It is difficultly soluble in water, and much less so in saline solutions, and hence the advantage of using excess of nitre in preparing it. By Fritzche's experiments it appears to be a neutral salt.

Purpurate of Soda is of a dark brick-red colour, and may be obtained in crystals; it is much less soluble in water than the potash salt, requiring 3000 times its weight for solution, or even more at 60°. The purpurates of lime, barytes, and strontia are still less soluble than those above described; they are of a deep greenish colour, but when dissolved in water they impart a purple colour to it. In the opinion of Berzelius there are two salts of lime; one of which is a bulky red crystalline powder, and the other, which is greenish-black, appears to be a subsalt. The purpurate of magnesia is very soluble.

When purpurate of ammonia is added to a solution of metallic salts, the effects produced are as follows:—Cobalt, a granular reddish precipitate; zinc, a fine yellow; tin, a scarlet precipitate; mercury, protosalts, a purple precipitate; persalts, a pale rose precipitate; silver, a deep purple one; the salts of lead, iron, nickel, and copper, the chlorides of gold and platina, alter their colour by the addition of purpurate of ammonia, but are not precipitated by it.

With respect to the characteristic properties of the purpuric acid, Dr. Prout is of opinion that it may be readily distinguished from all other substances by the beautiful colours exhibited by its alkaline and earthy salts, independently of its other properties, which are very peculiar. He further observes that the well known pink sediment which generally appears in the urine of those labouring under febrile affections, appears to owe its colour to the purpurate of ammonia, and perhaps occasionally to the purpurate of soda; and he has suggested that some of the purpurates, especially that of lime, might be used as a paint, and that others might be employed in dyeing.

PURPURI'FERA, Lamarck's name for a family of mollusks belonging to the section of his order *Trachelipoda*. The family consists of the genera *Cassidaria, Cassis, Ricinula, Purpura, Monoceros, Concholepas, Harpa, Dolium, Buccinum, Eburna,* and *Terebra*. The whole of these genera are treated of in the article ENTOMOSTOMATA.

PURSER. [NAVY, pp. 121, 122.]

PURSLANE. There are two varieties of the garden purslane, the *Green* and the *Golden* (the Portulaca sativa and oleracea of botanists), but these cannot be considered truly distinct species, for seeds from the same individual produce occasionally both green and golden-leaved plants. They are annuals, with fleshy succulent leaves, probably indigenous to the East Indies, but now apparently wild in the South of Europe and South America.

Purslane was formerly more used than at present, at least in this country, in salads, as a pot-herb, in pickles, and for garnishing. It is considered to be very cooling, and hence in warm countries it is more esteemed. Any light soil will suit it; being succulent, it will even thrive in sandy soil. It requires to be sown in April, or when the danger of frost is over, and covered very slightly with a little fine mould. Successional sowings may be made in May, June, and July.

PURVEYANCE (*purveance*, a providing), a prerogative formerly enjoyed by the king through the means of officers called purveyors, of purchasing provisions and other necessaries for the use of the royal household, and of employing horses and carriages in his service, in preference to all other persons, and without the consent of the owners. A privilege of the same nature was also exercised by many of the great lords. The parties whose property was thus seized were entitled to a recompense; but what they received was so inadequate, and so many abuses were committed under the pretext of purveyance, that it seems to have been always considered a most intolerable grievance. About forty statutes were passed upon the subject, many of them, like all the important early statutes, being a re-enactment of those preceding. Some of the most stringent occur in the 36th year of Edward III. The parliament of that year, which is said to have been held 'for the honour and pleasure of God, and the amendment of the outrageous grievances and oppressions done to the people, and the relief of their estate,' after a general confirmation of former statutes, immediately proceeds to enact five statutes on the subject of purveyance. These statutes confine the exercise of it to the king and queen, and provide that for the future 'the heinous name of purveyor shall be changed into that of buyer:' they forbid the use of force or menaces, and direct that where purveyors cannot agree upon the price, an appraisement shall be made, &c. &c. The provisions of these statutes are very full and satisfactory, but they appear to have wholly failed in their operation. Other statutes were passed, but without effect. Several of the charges against Wolsey were the exercise of purveyance on his own behalf. (4 *Inst.* 93.) In the time of Elizabeth, two attempts were made in the same year by the Commons to regulate the abuses of purveyance. The queen was extremely indignant at this, and desired the commons not to interfere with her prerogative. In the early years of her reign, Elizabeth seems to have employed this prerogative for the purpose of victualling her navy. She afterwards revoked the warrants issued for that purpose, and designed likewise to have taken away the commissions relating to the provision for her own household, some counties having agreed, some time after, to furnish it at a certain rate, to get rid of the collectors—a kind of vermin which the Queen called *harpies*. During the first parliament of James I., Bacon, on presenting a petition to the king, delivered his famous speech against purveyors, which forms a sort of compendium of the heavy charges made against them. Several negotiations took place in that reign for the purchase of the prerogative of purveyance, but nothing was done. Under the Commonwealth it fell into disuse. Purveyance was not formally abolished till after the Restoration. By the 12 Ch. II., c. 24, this branch of the prerogative was surrendered by the king, who received in lieu of it a certain amount payable on exciseable liquors. Probably in the earlier periods of our history the existence of purveyance was almost necessary for the support of the royal household, especially during the progresses which were then so frequent. This seems almost a necessary inference from its continuance in spite of so many attempts to suppress it. Even after its final abolition by the statute of Charles II. several temporary statutes were passed, in that and the succeeding reign, for its partial revival on the occasion of royal progresses. On behalf of the navy and ordnance, a statute to that effect occurs as late as 11 and 12 Will. 3. (Camden, 388; Bacon's *Works*, vol. vi., p. 3, Montagu's edit.; Hume's *Hist.*; 1 Bl. *Com.*, 287; 3 *Inst.*, 82; 4 *Inst.*, 273.)

PUS. [ABSCESS; INFLAMMATION.]

PUSHKIN, ALEXANDER SERGEIVITCH, called by some the Russian Byron, and certainly the most distinguished poet of Russia in the present century, was born at St. Petersburg, May 26th (June 7th), 1799, and was educated in the Imperial Lyceum at Tzorskoe-Selo, which he quitted in 1817. While at that seminary he appears to have displayed more of natural quickness than of application, for though he made very little progress in his studies, he had even then begun to write poetry. On quitting the Lyceum, he began to exercise his pen with more of enthusiasm than of discretion in favour of liberalism; and although his first productions of the kind were circulated only in manuscript, his opinions became known, and he was represented to the government as the advocate of republican opinions. This occasioned his being sent into a kind of nominal banishment by the emperor Alexander in 1820, being compelled to accept some subordinate situation under the governor-general of Odessa. Perhaps Siberia would have been the place of his destination, had not his 'Ruslan and Liudmila' just then appeared, and been warmly received by the public. Of this legendary poem, in six cantos, which carries us back to the half-fabulous time of Vladimir, the Russian Charlemagne, a tolerably full account is given in an article on Russian literature in the second volume of the

'Foreign Review,' where it is said, 'Such is a brief outline of the romance, which is related with a grace and felicity that would do credit to the author of the "Bridal of Triermain."' A translation of an episode from the first canto may also be found in St. Maure's 'Anthologie Russe.'

The success of this, his first production of any length, did not however induce Pushkin to cultivate this kind of epic, if we may so term it, for he thenceforth abandoned it altogether, and adopted in his subsequent poetical narratives a looser and more lyrical form, in which, taking for his subject some single incident or brief and detached historical episode, he renders it a vehicle for the delineation of character, the expression of impassioned sentiment and feeling, and the portraiture of local manners and scenery. His earliest production of this class, his 'Plennik Kavkaza, or Prisoner of the Caucasus' (1822), is a mere sketch, almost meagre indeed in its outline, relating no more than the escape of a young Russian captive from a horde of wild Tcherkessians, through the assistance of a Tcherkessian maiden; but it is vigorously touched, the images are as varied as they are distinct, and the style is eminently graphic, though perfectly simple, and without any of that common-place frippery of fine words and phrases which are so frequently employed to conceal the inanity of a writer's ideas. This poem was translated into German almost immediately after its appearance.

To the 'Plennik' succeeded his 'Fountain of Bakhtchisarai' (1824), a production of much superior interest to the former, and in which the characters of Zarema and Maria, the former of whom has not a few traits in common with Byron's 'Gulnare,' are strikingly contrasted. For the manuscript of this poem, which consists of only six hundred lines, the author obtained 3000 roubles—a degree of remuneration then almost unprecedented. His reputation was now fixed, and the public impatiently waited for other productions of his muse. But he allowed an interval of nearly three years to elapse (1824-7) between writing his 'Tzigani' ('The Gypsies') and its being printed; and of his 'Evgenii, or Eugenius Onegin,' though the first chapter or canto appeared in 1825, the work was not printed till 1828. The 'Tzigani' had indeed been extensively circulated in manuscript previously to its issuing from the press, and in that form had acquired a celebrity that was no doubt enhanced by the kind of mystery attending it. It is a half-narrative, half-dramatic composition, constructed out of exceedingly slight materials, and gives a picture of the life of the gypsy tribes in Bessarabia, one evidently coloured after nature, but not calculated to render any one enamoured with the simplicity of that nomadic race. The 'Onegin,' avowedly a production akin to Byron's 'Beppo,' is a sort of novel in verse, descriptive of Russian life and manners in the capital and the provinces, and it is generally understood that the hero of it whose name it bears, was intended by Pushkin for a partial portrait of himself.

In 1829 appeared almost the last and also the best of his narrative poems, namely that entitled 'Poltava,' the hero of which is the same person as Byron's 'Mazeppa,' but here exhibited under a very different aspect—not as the loving page, but as the Hetman of the Kossaks, who, notwithstanding his well-matured years, inspires a maiden, whom he has carried off from her parents, with an ardent attachment. An analysis of this poem, together with metrical translations of one or two scenes from it, will be found in the ninth volume of the 'Foreign Quarterly;' and the same article also contains some account of the 'Fountain of Bakhtchisarai' and the 'Tzigani.' The extracts there introduced are the more interesting, as not a single specimen of Pushkin occurs in Bowring's 'Russian Anthology,' that work having been published before Pushkin had risen into celebrity.

His dramatic poem of 'Boris Godunov,' produced about this period, is one of the most interesting of all his productions, in which, while historical fidelity as to the principal events is strictly observed, the poetical element prevails both in the language and the characters and situations; besides which merits, this piece possesses no small attraction as a faithful picture of national manners and feelings, replete with force and truth. After this, Pushkin nearly abandoned poetry altogether, and applied himself to prose composition, having been not only recalled from exile, but taken into favour by the emperor Nicholas, who appointed him historiographer, with a pension of 6000 roubles. This change in his fortunes was—if it did not occasion—accompanied by no less striking a change in his opinions, which, after being on the side of liberalism, settled into the contrary extreme. On the other hand, his popularity in the literary world began to decline; at all events, it rather abated than increased, for during the last seven or eight years of his life, his pen was almost inactive, the chief thing he produced in that time being a history—not of Peter the Great, as was expected—but of the rebel Pugatchev. His other productions during that interval amount to no more than a few tales and essays, and his articles in the 'Sovremennik, or Contemporary,' a literary quarterly miscellany, projected by him in 1836, and afterwards continued for the benefit of his family. Several of his posthumous papers, including the 'History of the Iron Mask,' 'Memoirs of Moreau de Brasse,' and fragments of various unfinished tales, romances, &c., have since appeared in that publication, which also contains a circumstantial narrative of his last moments, by one of his friends. His death was in consequence of a wound received in a duel with an officer; and after lingering two days, at times in excessive agony, he expired at St. Petersburg, January 29th (February 10th), 1837, in his thirty-eighth year. Besides paying his debts and bestowing a pension of several thousand roubles upon the poet's widow and family, the emperor commanded a splendid edition of all his works to be published at his own expense.

PUSTULIPORA. [MILLEPORIDÆ.]

PUTCHUK is the name by which a fragrant root is designated in the price-currents of Calcutta and Bombay, whence it is exported to Canton, being highly esteemed by the Chinese as an incense. From the places of export this would appear to be a product of India, but neither the plant which yields it nor the place where it grows has been discovered until very recently. The discovery is interesting, as the Putchuk is a substance which was known to the antients. Dr. Royle, while in the north-western provinces of India, obtained a root which formed a considerable article of commerce, and which was said to be brought from still farther north, that is, from Lahore. It was warm and aromatic in taste, fragrant in odour, and frequently called *orris* (*Iris root*) by Europeans in India, though by the natives in northern India it is called *kooth*. On comparing specimens of kooth which he obtained in northern India with what was called *putchuk* in Calcutta, he found that they were identical, and he was subsequently informed by Mr. Beckett, who was long settled as a merchant in northern India, that what the latter purchased from Umritsur under the name of kooth, he sold in Calcutta by that of putchuk, so that there can be no doubt of the identity of the two substances; but all that had been ascertained with respect to the place where it was produced, was that it seemed to be to the north of the Sutledge.

Koot'h, being used in India as a medicine, as well as exported to China, is described in the Persian works on Materia Medica in use in that country, and has assigned to it *kust* as the Arabic, *kooshta* as the Syriac, and *kostus* as the Greek name. Three kinds are described. Dr. Royle states that he was only able to meet with two kinds in India, one called *koost-hindee*, and the other *koost-arabee*: these evidently refer to two of the three kinds of Costus described by Dioscorides as the Arabian, Indian, and Syriac. (*Illust. Himal. Bot.*, p. 360.) There can be little doubt therefore that the kooth or putchuk is one of the kinds of costus of the antients, which was highly esteemed by them, and formed an ingredient in their most famous compound alexipharmic confections, such as the Theriaca and the Mithridatium. It was also highly esteemed by them as an incense, as, in the line of Propertius, 'Ure puer costum Assyrium redolentibus aris;' and is mentioned by Horace as 'Achaemenium costum' (*Od.*, iii. 1).

The identity of *kooth* and *costus* was however long ago ascertained, though not generally known, as is evident in the following passage from Garcias ab Horto, in Clusius (*Exot.*, lib. x.), 'Est ergo Costus dictus Arabibus *Cost* aut *Cast*; in Malacca, ubi ejus plurimus est usus, *Pucho*, et inde vehitur in Sinarum regionem.' In MacCulloch's 'Commercial Dictionary,' Putchook is described as 'the root of a plant growing in Sinde. When burned, it yields a fine smell. The Chinese beat it into a fine powder, which they burn as incense in the temples of their gods.' Of the Putchuk 6697¾ bazar maunds, of the value of 99,903 rupees, were exported from Calcutta in the year 1837-38.

On Dr. Falconer's proceeding on his journey to Cashmere, Dr. Royle requested him to make inquiries respecting this substance, and he discovered that it was exported from the valley in large quantities to the Punjab, whence it finds its way to Bombay and Calcutta: and that it is sold in China at an advance of about three thousand per cent. on the price at which it is gathered in Cashmere. Dr. Falconer subsequently found it growing in great abundance all round the elevated summits of Cashmere. From the plants with which it is associated, and the circumstances under which the Koot grows, being one of the Compositæ, or Thistle tribe, with feathered seed, of which when once established the dissemination becomes easy, Dr. Falconer has no hesitation in thinking that it could be produced to an unlimited extent, of the best quality, in the Himalayas at elevations of from 7500 to 9000 feet above the sea, and that the Choor Mountain alone might be brought in a few years to produce thousands of maunds of it. Preparatory to diffusing the Koot or Costus, he has introduced it into the Himalayan nursery attached to the Saharumpore botanic garden.

Finding that it belongs to a new genus, he has named it Aucklandia, in honour of George earl Auckland, Governor-General of India, 'as a distinction well merited by his lordship's services in the cause of Indian botany.' (Royle, *On the Productive Resources of India.*)

PU'TEOLI. [POZZUOLO.]

PUTNEY. [SURREY.]

PUTRANJI'VA, an Indian genus referred by Dr. Roxburgh to Nageia, but which has been separated by Dr. Wallich under the above name, which is a Sanscrit compound, consisting of the words 'pootra,' *a son*, and 'jeeva,' *life*, in consequence of the seeds being strung by parents round the necks of children, under the supposition that they will preserve them in health. They are sold in bazaars throughout India for this purpose. P. Roxburghii, the only species known, forms a large timber-tree, with an erect straight trunk, and a white close-grained very hard wood. The head is large and shady, composed of numerous spreading branches, with shining dark-green leaves arranged on two sides of the branchlets. The flowers are diœcious, the male ones crowded together; the perianth small, calyx-like, four- to five-leaved; corol none; stamens three; filaments thread-like, all or only two united together, and the third free. The female flowers solitary in the axils of the leaves, with long footstalks; perianth five-leaved; ovary ovate, oblong, three-celled; cells two-seeded; styles three, filiform; stigmas crescent-shaped and toothed; drupe one-seeded. Young plants of this tree have been cultivated in moist stoves in this country. The genus has been referred to the natural family of Myricaceæ, but is considered by Endlicher as more nearly allied to the Antidesmeæ.

PUTREFACTION. [DECOMPOSITION; FERMENTATION: INTERMENT.]

PU'TSCHIUS, ELIAS, was born at Antwerp in 1580. He became early distinguished as a scholar, and at the age of twenty-one he published an edition of Sallust with fragments and notes. Four years afterwards he published the work by which he is chiefly known, 'Antient Authors of Latin Grammar,' small folio, Hanau, 1605. These authors are thirty-three in number, of whom several were never before printed, and the rest were so much corrected that they might seem, as he says in the title-page, to be then published for the first time. This work is dedicated to Joseph Scaliger, and it appears probable, from the character of the dedication, that Putschius had been a pupil of Scaliger. Three indexes are appended; the first of authors, the second of Greek words, and the third, which is most copious, of things and words in general. This collection of antient grammarians is of great value to all who are desirous of gaining a critical knowledge of the Latin language, and it also conveys indirectly many aids to the student of the Greek. Putschius died at Stade, March 9, 1606, in his 26th year. (Fabricius's *Bibliotheca Latina* contains an ample account of the treatises collected by Putschius.)

PUTTY, the useful cement used by glaziers for fastening the glass in the frames of windows, is composed of linseed-oil and whiting. The whiting should be well dried, and then pounded and sifted till it becomes a fine powder and is quite free from grit. The whiting, a little warm, should be gradually added to the oil, and well mixed by means of a piece of stick or a spatula. When it is sufficiently stiff, it should be well worked with the hand on a table, and afterwards beaten on a stone with a wooden mallet, till it becomes a soft, smooth, tenacious mass. Putty by exposure to the air gradually hardens till it becomes almost like stone. A ball of putty, when left some days, becomes somewhat hard, but may be easily softened by beating.

PUY, LE, a town in France, capital of the department of Haute Loire, and the seat of a bishopric, situated on the south bank of the Borne, one of the early feeders of the Loire; 273 miles in a direct line south by east of Paris, or 304 miles by the road through Nevers, Moulins, and Clermont-Ferrand; in 45° 2′ N. lat. and 3° 52′ E. long.

Le Puy originated in the eighth century, from the resort of pilgrims occasioned, it is thought, by the sanctity of an image of the Virgin. The town, thus formed, took its name from the old Aquitanian word *Puech*, or *Puich*, 'mountain,' a name descriptive of its situation on the slope of Mount Anis crowned with the volcanic rock Corneille. The site of the town, which lies among the high lands of central France, is about 2000 feet above the level of the sea. In the middle ages, Le Puy was the capital of Le Velay, and the place of assembly for the states of that province. In the religious wars of the sixteenth century, it suffered severely, and was one of the last places which held out in France against Henri IV.

Owing to its situation, the town presents a picturesque appearance; but the streets are ill laid out, steep, narrow, dirty, and paved with lava; the houses are of lava, and are for the most part old and ill built. The cathedral, built in the tenth century, the most striking public edifice in the town, is not worthy of the high encomiums which have been bestowed upon it. Its architecture is heavy and inelegant; and it is in a great degree hidden by the adjacent buildings of the hospital and episcopal palace. Even its lofty situation loses part of its effect by the superior elevation of the summit of the rock Corneille, on which summit are the ruins of the antient castle. The front of the cathedral is approached by an immense staircase of more than a hundred steps. The interior contains a good picture of the Massacre of the Innocents, an elaborate carving of the Martyrdom of St. Andrew in relief on wood, and the reputed miraculous image of the Virgin, to which it is supposed the town owes its origin. The material, cedar wood, covered with bands of fine linen firmly glued on the wood in the manner of an Egyptian mummy, and painted in distemper, and its posture, seated like some of the Egyptian divinities, indicate an Eastern origin. If brought hither, as some suppose, by one of the Crusaders, it cannot have been the object of the pilgrimages from which the town took its rise. It was certainly much venerated in the middle ages; and among those who visited it were several popes and nine kings of France. There are three other churches: that of St. Laurent is the burial-place of the bowels of Bertrand Duguesclin, whose tomb was destroyed by Baron des Adrets, the Huguenot leader, in the religious wars; that of St. Michel is remarkable for its situation on the summit of a conical volcanic rock, in which is cut a flight of more than two hundred and fifty steps. As the church is surmounted by a pointed spire, it presents, with the rock on which it stands, the appearance of an enormous cone or obelisk. The office of the prefecture is a handsome modern building, and there are a town-hall, three hospitals, and buildings for the seminary for the priesthood, for the college or high school, for the commercial court, and for the two justices of the peace; there are also a range of cavalry barracks and a large prison. The lower part of the town is partially surrounded by a kind of boulevard, and there is an agreeable public walk.

The population of Le Puy, in 1826, was 14,988; in 18[illegible], was 14,844 for the town, or 14,930 for the whole commune: in 1836 it was 14,924 for the commune. The chief manufacture is that of blond and other lace, which employs all the poorer women in the town and neighbourhood. The lace is exported, chiefly to North America. Blankets and woollen stuffs, and coarse woollen cloths, are made; woollen yarn is spun, and wool dyed. Lime-burning, brewing, and the tanning and currying of all kinds of leather are carried on; goat-skin bags or bottles for wine, oil, &c. are made; and hats, nails, and the small bells used by the muleteers and carriers in the centre and south of France are manufactured. The trade carried on is chiefly in grain and pulse, in which the neighbourhood is very productive, lace, and leather. There are fifteen yearly fairs. A great quantity of wine is produced in the neighbourhood, but, from its inferior quality, it is consumed only among the poorer classes.

There are, besides the institutions already mentioned, a cabinet of natural history, a museum of paintings, sculptures, and sculpture; a public library of 5000 volumes; a theatre, and a departmental nursery.

Le Puy is in the volcanic district of Central France; the surrounding mountains are granitic, capped with masses of rock of volcanic origin. The isolated rock Corneille, which commands the town, that of Polignac, about a mile distant, and that of St. Michel, crowned by the church of that name, are all of volcanic origin; and at the village of Espaly, close to the town, are a group of basaltic rocks, in the form of perpendicular prisms, and on a neighbouring mountain other basaltic rocks, formed of horizontal prisms. Among these natural curiosities are the remains of some buildings of the Roman period or of the middle ages.

The arrondissement of Le Puy comprehends 112 communes, and has an area of 900 square miles. The population in 1831 was 129,722; in 1836, 139,844. It is divided into fourteen cantons or districts, each under a justice of the peace.

The diocese of Le Puy comprehends the department of Haute Loire. The bishop is a suffragan of the archbishop of Bourges.

PUY DE DÔME, a department of Central France, bounded on the north by that of Allier, on the east by that of Loire, on the south by those of Haute Loire and Cantal, and on the west by those of Corrèze and Creuse. Its form approaches to that of a regular quadrangle, having its greatest length from east to west, from the neighbourhood of St. Anthême to the banks of the Chavanons, 72 miles; and its greatest breadth from north to south, from the neighbourhood of Montaigu to the border of the department of Cantal, 60 miles. The area of the department is estimated at 3087 square miles, exceeding the average area of the French departments in the proportion nearly of 4 to 3, and surpassing the conjoint areas of the English counties Kent and Sussex. The population in 1831 was 573,106; in 1836, 589,438; showing an increase in five years of 16,332, or nearly three per cent., and giving 191 inhabitants to a square mile. Both in amount and density of population it is inferior to very few departments, and very far exceeds the average in both respects. In density of population it slightly exceeds the county of Sussex, but falls far below Kent. Clermont-Ferrand, the capital, is near the mountain Puy-de-Dôme, on a small feeder of the Allier, 216 miles in a direct line south by east of Paris, or 232 miles by the road through Nevers and Moulins; in 45° 46′ N. lat. and 3° 5′ E. long.

The department is very mountainous. The principal chain of the Auvergnat mountains crosses the department from north to south. The Monts-Dômes, in the centre of the department, form part of the chain; the loftier group of the Monts-Dor, which are to the south of the Monts-Dômes, also belong to it. On the eastern border of the department is the chain of the mountains of Forez, and La Madeleine, or La Madle, separated from that just described by the broad valley of the Allier; and on the north-western border, separated from the principal chain by the valley of the Sioule, is a subordinate ramification of the Auvergnat mountains. We subjoin the altitudes of the principal summits of the main chain:—Monts-Dômes—Puy-de-Dôme, 4849 feet; Petit Puy or Dôme, 4183 feet; Puy Chopine, 3905 feet; Grand Sarcoui, 3436 feet; Grand Suchet, 4052 feet; Puy de Pariou, 4009 feet; Puy de Côme, 4174 feet; Monts Dor—Pic de Sancy, summit of Mont-Dor, 6224 feet; Puy Gros, 5925 feet; Puy de Monichar, 3931 feet; Cacadogne, 5920 feet; Puy Ferrand, 6116 feet; Puy de l'Aiguille, 5738 feet; Puy de la Haute Chaux, 5627 feet; Roche Vendeix, 3972 feet; Roche Sanadoire, 4259 feet. (*Ann. du Bur. des Long.* for 1837; Malte-Brun.)

The geology of the department is described elsewhere; it forms part of the district of Auvergne. [AUVERGNE, *Geology of*, vol. iii., p. 157; FRANCE, *General Geological Character*, vol. x., p. 498, seq.]

The department yields coal, lead, ironstone, and antimony. In 1825 a rich bed of alum was discovered at the foot of the Puy de Sancy in Mont-Dor. The number of coal-works in 1834 was eight, giving employment to 184 labourers, of whom 160 worked in the mines. The quantity of coal produced in 1834 was 9820 tons; in 1835, 11,387 tons. There are no iron-works. Gypsum is quarried.

There are several mineral springs, hot and cold. Those of Mont-Dor are the most frequented. Their temperature is 35° Réaumur, or 133° Fahrenheit; they are acidulous. There are other warm springs at Châtel Guyon (30° Réaumur, 100° Fahrenheit), St. Mart (24° Réaumur, 86° Fahrenheit), St. Nectaire (36° Réaumur, 115° Fahrenheit), Bourboule (52° Réaumur, 149° Fahrenheit), Chateauneuf (38° Réaumur, 118° Fahrenheit). There are cold mineral waters at Bar, Châteldon, Vic-le-Comte, and St. Myon, the last chalybeate.

The department belongs to the basin of the Loire, except a small portion at the south-western corner, which is included in the basin of the Garonne. The Loire itself is beyond the boundary of the department; but the Allier, one of its principal tributaries, enters the department on the south side, between Auzon and Nonnette, and flows northward for about 58 miles, till it enters the department of Allier above Vichy. It receives numerous tributaries; the Alagnon, the Couze, the Crouse, the Couses, the Monne, the Lachau (which receives the Ambène and the Morges), all small streams from the main chain of the Auvergnat group, on the left bank; and the Dore, which receives the Ance-dogne and some smaller streams from the mountains of Forez, and La Madeleine, on the right bank. The Sioule, which joins the Allier in the department of Allier, waters the valley between the principal Auvergnat chain and the subordinate ramification. It receives the Coulerou, the Sioulet, and some other small streams. The Cher, one of the principal feeders of the Loire, just touches the north-western border. That portion of the department which is in the basin of the Garonne is watered by the Dordogne, which rises on the slope of Mont-Dor, and its tributaries the Chavenous and others. There are several small lakes in the principal chain or the subordinate ramifications of the Auvergnat mountains; from the latter lakes some of the feeders of the Sioule flow. Lake Pavin, near Mont-Dor possesses some remarkable features. It is in a circular basin or hollow, resembling the crater of a volcano. Its margin is covered with wood, which owes its verdure to the refreshing dews produced by the copious evaporation of the lake, which is of great depth. The waters are very dark. The little river Crouse flows from this lake. The rivers and lakes abound with fish.

None of the rivers are navigable, except the Allier; and in Brué's *Map of France* (Paris, 1818) the navigation of the river is marked as commencing just where it quits the department. But the official document, *Statistique de la France*, assigns to it a navigation of 58 miles within the department, comprehending all that part of its course which is within the boundary. The difference arises from this part of the river being navigable at particular seasons, and only with the stream. There are no canals; and the industry of the department suffers materially from the want of water-conveyance.

There are seven government roads, having an aggregate length of 278 miles, viz. 127 in good repair, 84 out of repair, and 67 unfinished (1 Jan., 1837). The principal road is that from Paris by Clermont to Montpellier. It enters the department on the north, a short distance beyond Gannat in the department of Allier, and runs through Aigue-Perse, Riom, Clermont, Issoire, and St. Germaine Lembron, beyond which it enters the department of Haute Loire. A road runs eastward from Clermont by Thiers to Lyon (Rhône); another westward by Aubusson (Creuse) to Limoges (Haute Vienne); and a third south-west by Tulle (Corrèze) and Périgueux (Dordogne) to Bordeaux (Gironde), with a branch by Aurillac (Cantal) to Toulouse (Haute Garonne). The departmental roads have an aggregate length of 223 miles, of which (1 Jan., 1837) 111 were in repair, 44 out of repair, and 68 unfinished. The bye-roads and paths have an aggregate length of 7000 to 8000 miles.

The soil varies. The sides of some of the volcanic 'puys,' or mountains, are covered with fine grass, in which numerous cattle are pastured, and others are covered with extensive woods; the lower hills and slopes are occupied by fields of rye, oats, hemp, buckwheat, and potatoes, or by sheep-walks, with a little wood. The mountains of Forez and La Madeleine are covered with woods or with barren heaths. The valley of the Allier, known as the 'Limagne of Auvergne,' is eminent both for fertility and beauty; it produces in great abundance wheat, barley, oats, wine, and fruits of various kinds, especially walnuts, and hemp. The higher grounds produce rye. The quantity of land in the department under the plough is estimated at nearly one-half the whole area. The meadows occupy one-ninth of the area; the heaths and open pastures occupy one-fourth. The quantity of cattle reared is very great; they form an important article of traffic, and furnish an abundance of cheese and butter, of which the cheese is exported in considerable quantity. The vineyards are not so extensive as in many other departments: the best red wines are those of Chanturgue, Chateldon, and Ris; the best white wines are those of Corent. The woodlands occupy above a tenth of the area. The pine grows on the summits of the mountains, below them the beech grows, and still lower down are the oak, the service-tree, and the chestnut: the last furnishes an important article of food to the poor mountaineers. A considerable quantity of charcoal is made, and timber for masts and building is exported; walnut-oil is also an important article of trade.

The peasantry of the department are a primitive race, little instructed, and wedded to long established usages. In their heavy wooden-soled shoes, or sabots, they drive their cows or oxen attached to creaking cars, the wheels of which are without tire, or guide their clumsy plough: the words with which they stop their team, 'sta, bos,' indicate by their Latin form the long continuity of their usage. Their cottages are wretched, and their fare miserable. They are however industrious and honest: but long-standing prejudices have obstructed their improvement.

The department is divided into five arrondissements, as follows:—

Arrondissement.		Area in sq. miles.	Communes.	Population in 1831.	Population in 1836.
Clermont	Central & West	692	107	171,566	175,910
Ambert	S.E.	473	52	87,616	90,675
Issoire	S. & S.W.	705	116	99,559	100,740
Riom	N. & N.W.	885	130	146,495	151,456
Thiers	N.E.	332	39	67,870	70,657
		3087	444	573,106	589,438

It comprehends forty-seven cantons or districts, each under a justice of the peace.

The arrondissement of Clermont contains Clermont-Ferrand, capital of the department (population in 1831, 24,077 town, 28,257 whole commune; in 1836, 32,427 commune) [Clermont-Ferrand], on a feeder of the Allier; St. Amand, Montons, Le Crest, Les Martres, Cournon (population 2664), Lempde (population 1883), Beaumont (population 1858), Aubières (population 3513), Cebassat (population 2583), Gerzat (population 2498), and Pont du Château (population 3429), between the main chain of the Auvergnat mountains and the Allier: Beauregard, Vertaizon (population 2735), Mirefleur, Vic-le-Comte (population 2150 town, 3153 whole commune), and Billom (population 4157 town, 4746 whole commune), near the east bank of the Allier. All these places are in the Limagne. Rochefort, near the Sioule, Herment, near the Sioulet, and Bourg Lastic, near the Chavanoux, are on the western side of the principal mountain-chain. Les Martres, or more fully Les Martres de Vayre (population in 1831, 1920 town, 3026 whole commune), is near the bank of the Allier; the townsmen carry on trade in wine. Montons has probably about the same population in its commune. Pont du Château occupies the summit and slope of a hill on the left bank of the Allier, over which river is a fine bridge of eight arches. On the highest ground in the town is a mansion formerly belonging to the family of Montboissier, now to the municipal authorities; and attached to this mansion is a park. Pont du Château is a place of rendezvous for the boats which descend the stream, laden with coal, wine, &c. A considerable fishery is carried on on the river. Limestone quarries are worked in the neighbourhood, from which chalcedony and crystals of quartz are procured. Beauregard has a castle or mansion, formerly belonging to the bishops of Clermont, commanding a fine prospect. Vic-le-Comte (otherwise Vic-sur-Allier) takes its designation from having been for a long time the residence of the counts of Auvergne. It has mineral waters of considerable repute, and the ruins of a very beautiful antient chapel. Billom was in the middle ages the seat of a school of good repute, and was a place of some note during the war of the League. The townsmen spin linen-yarn, and carry on trade in the hemp and oil produced in the surrounding country. There is a commercial tribunal at Billom. The antient school exists at present as a secondary ecclesiastical school, and is under the direction of some Jesuits. Herment has sixteen yearly fairs for horses, horned cattle and sheep, grain, hemp, yarn, charcoal, and coal.

In the arrondissement of Ambert are Ambert (population in 1831, 3470 town, 7650 whole commune; in 1836, 8016 commune) [Ambert], Olliergues, Marsac (population 3206), Arlant or Arlanc (population 3567), on or near the Dore; St. Anthême (population 3286), and Viverols, in the country on the right bank of that river; and Cunlhat or Cunlhac (population 3470), St. German-Lherm, and St. Bonnet, in the country on the left bank. Olliergues or Oliergues has some manufactures of coarse linens and other woven stuffs: Marsac has manufactures of tapes, laces, linens, &c.; also some tanyards. Arlant and Viverols have manufactures similar to those of Marsac. Camlets, linens, and other woven goods are also made at Cunlhat. St. German-Lherm has several fairs for cattle, wool, woollen yarn, and hemp. At the village of St. Amand-Roche-Savine, between Ambert and Cunlhat, lead-mines are worked.

In the arrondissement of Issoire are Issoire (population in 1831, 5990 for the commune; in 1836, 5741), Nonette, St. Germain-Lambron (population 1938), and La Mongie, on or near the Allier; Sauxillanges and Usson, in the country on the east or right bank of that river; Ardes, on the Couze; Besse and Vodable, on or near the Crouse; Champeix, on the Couses, and La Tour, on a feeder of the Dordogne west of Mont-Dor. Issoire is a walled town on the Couze, a short distance from its junction with the Allier. It was formerly a place of strength, and in the war of the League sustained two sieges, by which it was nearly destroyed. The town is small and ill built. It has a very antient church, adorned outside with ornaments in mosaic. There is a covered market built of granite. The population is partly agricultural, the principal articles of growth in the neighbourhood are wine and hemp (which are sent, the former to Paris, the second to Nantes), and walnuts, in the oil of which considerable trade is carried on. The neighbouring district yields antimony and coal. Copper cauldrons and other utensils are made in the town. There are some judicial and fiscal government offices. Issoire was a place of some importance in the middle ages. Nonette is on a hill, nearly surrounded by the Allier, and was in the middle ages a place of strength. The counts of Auvergne had a castle here, which was rased in 1658 by order of the king, Louis XIV. At St. Germain-Lambron considerable trade in corn and wine is carried on; and there are several yearly fairs for cattle, timber, and corn. There are coal-pits near La Mongie. At Sauxillanges woollen stuffs, scythes, sickles, saws, and earthenware are made. Usson has the ruins of a castle, built of basalt, one of the strongest fortresses of the middle ages. It was for twenty years the residence of Marguerite (Margaret) of France, queen of Henri IV.; and was razed in the reign of Louis XIII. Besse is in the midst of picturesque scenery. It is built of basalt. The townsmen carry on trade in cattle and cheese. Flax is extensively cultivated in the surrounding district. Vodable or Vaudable has some ruins of a former residence of the counts of Auvergne. La Tour, distinguished as La Tour d'Auvergne, situated on a basaltic height, was the hereditary lordship of the last family which possessed the county of Auvergne. The ruins of the castle of these nobles still remain. There are several considerable yearly cattle-fairs. In the commune of Auzat, on the Allier, near Issoire, are iron and coal mines, and a glass-house for making bottles.

Just within the limits of this arrondissement is the village of Mont Dor-les-Bains. It is on the north-western slope of Mont Dor, near the source of the Dordogne, over which there is an iron bridge. The baths, a modern erection of volcanic rock, and of simple but solid and elegant architecture, are on the site of those erected by the Romans, by whom the mineral waters of the place were esteemed. The village, which has of late years been much enlarged and improved, is frequented during the season (which lasts from the commencement of June to the middle of September) by a great number of bathers. There are some remains of Roman buildings, and the picturesque scenery which surrounds Mont Dor increases the attractions of the place.

In the arrondissement of Riom are Riom (pop. in 1831, 11,992 town, 12,379 whole commune; in 1836, 11,[illegible] commune [Riom], and Ennezat, on the Ambène or Eubenne, a feeder of the Lachau; Volvic (pop. 1914 town, 3[illegible] whole commune), on another feeder of the Lachau; Manzat, Combrondes, and Artonne, on the Morges, a third tributary of the same stream; Randans and Aigueperse (pop. 32[illegible]), near the northern boundary of the department; Pont Gibaud, St. Gervais, and Menat, on or near the Sioule; and

Giat, Pionsat, and Montaigu les Combrailles, near the north-western boundary of the department. Volvic is on a volcanic site, and is built of lava quarried in the neighbourhood. There is in the town a school of design and of sculpture for architectural ornaments, the works of which, comprehending shafts of columns and capitals, funereal monuments and slabs, are chiefly of lava. The quarries are very curious; they furnish a section of successive currents of fused volcanic matter, increasing in closeness of grain in proportion as they are deeper beneath the surface. The lava is generally porous, but susceptible of a certain polish so as to be available for sculpture. Clermont-Ferrand, Riom, and most of the neighbouring towns are built of it; and for many years past large quantities have been sent to Paris for foot-pavements. Aigue-Perse is pleasantly situated, and consists of one wide and very long street on the road from Paris to Clermont, lined with houses, generally well built. The principal church has a tolerably good painting of St. Sebastian. Near the town is the château of La Roche, the birthplace of the celebrated chancellor Michael L'Hopital, and a spring, from which noxious exhalations of carbonic acid gas arise. At Pont Gibaud are a saw-mill and an extensive flour-mill. There are mineral springs and lead-mines in the neighbourhood. Black and red tripoli are obtained near Menat. Giat has a monthly fair for cattle, butter, and cheese.

In the arrondissement of Thiers are Thiers (pop. in 1831, 6586 town, 9836 whole commune; in 1836, 9982 commune), on a feeder of the Dore [THIERS]; Croupière or Courpierre, Puy-Guillaume, Châteldon, and Ris, on or near the Dore; Maringues (pop. 3072 town, 4181 whole commune) on the Lachau; Lezoux (pop. 1630 town, 3447 whole commune), between the Allier and the Dore; and Vollorre or Vollore (pop. 3881), in the country east of the Dore. At Courpierre is a bone-mill for grinding bones for manure. At Puy-Guillaume the pines of the neighbouring mountains are cut by saw-mills into deals and planks. Châteldon has mineral waters; and both this town and Ris are situated in a wine-growing district, and carry on trade in wine. At Maringues, chamois and other leather is manufactured, and a large corn-trade is carried on, favoured by the situation of the town, which is in the most fertile district of the Limagne. Lezoux, on the road between Thiers and Clermont, is a neat town, with a fine market-place, two small public walks, and an hospital. There are four yearly fairs, at which considerable business in corn and hemp is done. In the neighbourhood of Vollore is a Roman milliary column with an inscription in honour of the emperor Claudius Cæsar. At St. Remy, near Thiers, which, though only a village, has a population of about 4000, a considerable quantity of cutlery is manufactured.

The industry of the department is considerable; the paper of Ambert, the cutlery of Thiers, and the lava ornaments of of Volvic are among its principal productions; but its development is checked by the want of sufficient means of water-carriage. The project has been conceived of forming a lateral canal on the bank of the Allier, but no steps have been taken to carry the plan into effect.

The department constitutes the diocese of Clermont, the bishop of which is a suffragan of the archbishop of Bourges. It is in the jurisdiction of the Cour Royale of Riom, and in the circuit of the Académie Universitaire of Clermont, and in the nineteenth military division, the head-quarters of which are at Lyon. It returns seven members to the Chamber of Deputies. In respect of education it is one of the most backward of the departments of France. Of the young men enrolled in the military census of 1828-29, only 19 in every 100 could read and write, while the average of France was more than twice that number.

At the period of Cæsar's invasion the country now included in this department formed part of the territory of the Arverni or Arvernians, one of the most powerful of the Celtic nations, and leaders, with the Sequani, of one of the two great factions into which the Gauls were divided. Strabo writes the name of this nation Ἀρουερνοί, Plutarch Ἀρβερνοί. They had several other nations dependent upon or subject to them, as the Eleuteti, the Cadurci, the Gabali, and the Velauni. They had sustained some severe conflicts with the Romans before Cæsar's time; and in the general revolt against Cæsar, in the seventh year of his command, they acted a conspicuous part. Vercingetorix, the leader of that revolt, was an Arvernian [BOURGES; BOURGOGNE]; and Gergovia, the siege of which Cæsar was obliged to raise, was an Arvernian town in the neighbourhood of Clermont. The site of Gergovia is a mountainous ridge composed of volcanic and calcareous rocks, rising to between 2400 and 2500 feet above the level of the sea; it has a tolerably level summit nearly four miles in circuit, and agrees in other respects with the description of the locality given by Cæsar (*De Bell. Gall.*, lib. vii., 36-46).

In the subdivision of the diocese of Gaul under the emperors, the Arverni were included in the province of Aquitania Prima. The chief town of the nation, called at first Augustonemetum, afterwards Arverni, may be identified with Clermont-Ferrand, the capital formerly of the province of Auvergne, and now of the department. A station in the Peutinger Table, called by the frequently occurring name of Fines, was probably near the boundary of the department, in the subordinate ramification of the Auvergnat mountains. Martialis, mentioned by Sidonius Apollinaris, was near Volvic; and a station, the name of which appears in the Peutinger Table in the mutilated form Ub...m (perhaps Ublium or Ulbium), may be conjectured to be Olbie or Olby, on one of the early tributaries of the Sioule.

On the overthrow of the Romans, the country came into the hands of the Visigoths, and subsequently of the Franks. In the middle ages it was included partly in the county of Auvergne, but chiefly in the Dauphiné of Auvergne. A considerable district belonging to the province of Bourbonnais, and a small portion of Forez, a subdivision of the province of Lyonnais, are also included.

PUY LAURENS. [TARN.]

PWLLHELI. [CAERNARVONSHIRE.]

PYDNA. [MACEDONIA.]

PY'GATHRIX, M. Geoffroy's name for the Douc, or Cochin-China Monkey (*Lasyopyga*, Ill.).

Generic Character.—Head rounded; muzzle moderately prolonged; tail long; cheek pouches; hands longer than the fore-arms and the legs; anterior thumbs very short and slender; no callosities; buttocks fringed with long hairs.

Dental Formula:—

$$\text{Incisors } \frac{4}{4} : \text{ canines } \frac{1-1}{1-1} : \text{ molars } \frac{5-5}{5-5} = 32.$$

Example, *Pygathrix Nemæus*, Geoff. (*Lasiopyga Nemæus*, Ill.; *Simia Nemæus*, Linn., *Mant.*)

Pygathrix Nemæus.

This very rare monkey is perhaps the most remarkable of the whole tribe for the variety and liveliness of the colours with which it is marked, and which are the more striking from being distributed in large masses.

Description.—Upper part of the head brown with a dark reddish chesnut frontal band. The cheeks are clothed with very long and whitish or yellowish white hairs. The back, the belly, the arms, and the sides are grey with a somewhat greenish cast; the tail is whitish, and so are the rump and the forearms; the anterior fingers are blackish; the hips and thighs are blackish, and the legs of a brightish red chesnut; the more exposed parts of the face are of a reddish tint. Length rather more than two feet when erect; length of tail about 1 foot 7 inches.

Locality.—Cochin-China. Little or nothing is known of its habits.

PYGODA'CTYLUS. [BIPES; OPHIODES; SCELOTES; SCINCOIDEANS.]

PY'GOPODES, Illiger's name for those natatorial birds whose wings are well developed, and whose feet are placed very far back so as to facilitate their diving, as COLYMBUS, URIA, ALCA, &c. [DIVERS; AUK.]

PY'GOPUS. [BIPES; OPHIODES; SCINCOIDEANS.]

PYLORI'DIANS, *Pyloridea*, M. de Blainville's name for his ninth family of *Lamellibranchiata*, which he thus characterises:—

Body compressed, more and more cylindrical, the mantle more and more closed and prolonged backwards by two long tubes which are ordinarily distinct, with an anterior and inferior aperture for the passage of a very small and ordinarily conical foot; branchiæ narrow, free, and prolonged in the tube.

Shell regular, rarely irregular, nearly always equivalve, gaping at the two extremities; hinge incomplete, the teeth gradually vanishing (s'effaçant peu en peu); ligament internal or external; two distinct muscular impressions, united by a pallial impression which is very flexuous backwards.

M. de Blainville remarks that all the animals of this family live enclosed in the mud, the sand, or calcareous stone, almost without ever changing their place, always in a vertical position, the mouth below and the anus above. All their shells, he observes, (ordinarily white, and covered with an epidermis), hardly ever exhibit any striæ from the umbo to the base, but only lines of growth (stries d'accroissement).

Section 1. (Ligament internal.)

Pandora.

Generic Character.—*Animal* oval, compressed, rather elongated, with the mantle in form of a case, terminating backwards by two tubes united at their base only, and rather short, opening anteriorly for the passage of the foot, which is large, triangular, thick and swollen at its extremity; branchiæ large, free backwards, where the two pairs are united and terminate in a point in the siphon; labial appendages rather large, triangular, and not striated.

Shell delicate, regular, elongated, compressed, inequivalve, inequilateral, having the right valve flattened and the left more or less convex; umbones but little distinct; hinge composed of a cardinal tooth in the right valve, corresponding with a cavity in the left; ligament internal, oblique, triangular, inserted in a little pit with rather projecting edges; muscular impressions rounded, that of the mantle but little apparent and forming a small excavation. (Rang.)

M. Deshayes, for cogent reasons detailed in the last edition of Lamarck, is of opinion that both *Corbula* and *Pandora* should be arranged with the *Myæ* in the same family, viz. the *Myarians*, or *Myidæ*, and thus the family *Corbulidæ* would be obliterated as useless. He observes that when Lamarck wrote, but two living species were known. When M. de Blainville and M. Rang wrote, no more living species had been discovered, but they notice two fossil species. M. Deshayes further remarks, that Mr. G. B. Sowerby has published seven species in his *Species Conchyliorum*, and he refers to the descriptions of Mr. Say and of M. Quoy in the *Voyage of the Astrolabe*. This, with two fossil species, one from the environs of Paris and the other from Italy, makes, he observes, twelve species in a genus to which two species only were known to belong for some years. Notwithstanding this declaration, only eleven species, including but one fossil, appear in the text. In his Tables the number of living species given is seven and of fossil (tertiary) three. A *new species* and *Pandora rostrata* are recorded as both living and fossil (tertiary).

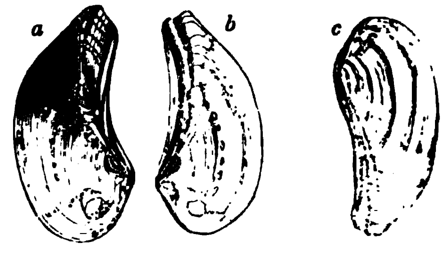
Habits of the Genus.—The *Pandoræ* live sunk in the sand so deep that it requires some difficulty to get them out. They have been found at depths varying from the surface to ten fathoms.

Geographical Distribution.—Wide. Species are recorded from Norway, the European seas, including the Mediterranean, the Pacific, the coasts of Georgia and Florida in North America, and New Zealand.

Example, *Pandora rostrata*.

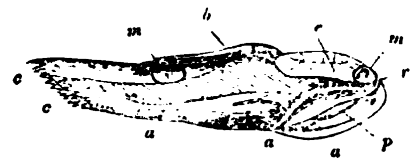
Description.—Shell with the anterior side produced, attenuated, rostrated, and angulated in each valve.

Localities.—Coasts of England and France, and the Mediterranean.



Shell of Pandora Rostrata.

a, Interior of deep valve; *b*, interior of flat valve; *c*, valves closed.



Soft parts of Pandora Rostrata.

a, a, a, r, Mantle, opened anteriorly to show the issue of the foot; *p*, foot; *b*, rectum; *e*, liver covered by the ovary; *m*, adductor muscles; *c, c*, tubes.

Mr. Cuming informs us that he has brought home several new species of *Pandora* from the Philippine Islands.

Mr. Garner, in his interesting paper 'On the Anatomy of the Lamellibranchiate Conchifera,' gives a view of the soft parts of a Pandora in the shell. (*Zool. Trans.*, vol. ii., pl. 18, *fig.* 6.)

Anatina.

Generic Character.—*Animal* oblong, rather thick, having the mantle closed by a rather large membranous lamina with a small rounded aperture at the antero-inferior part for the passage of a linguiform foot; two elongated tubes separated deeply at their extremity, the lower being rather greater than the upper; branchiæ narrow, free, and pointed backwards.

Shell delicate, sometimes translucent, oval, elongated or oblong, gaping at one or both extremities, equivalve; very inequilateral; umbones placed backwards, the upper anterior border being longer than the posterior; hinge without teeth, but having in their place a horizontal excavated apophysis or spoon-shaped process, receiving the internal ligament, and sustained by a lamina which is oblique and decurrent into the interior of the shell; muscular impressions distant, oval, united by a pallial impression which is but litte marked, but having a deep and rounded excavation backwards. (Rang.)

The genus *Anatina* does not appear in the Tables of M. Deshayes, but *Thracia* does. In the last edition of Lamarck, that acute malacologist observes, that having discovered in the hinge of many of the *Anatinæ* of Lamarck, as well as in that of other species which Lamarck did not know, a frail process (*osselet caduc*) which is free and retained solely by a part of the ligament, he has circumscribed certain genera founded upon the form and position of this process. Thus, he observes, there exists in the three first species of Lamarck's *Anatinæ* (*Lanterna, truncata*, and *subrostrata*) a tricuspid process or *osselet* applied upon the anterior side of the spoon-shaped processes; two branches of the process or osselet reach to the umbo, and there occasion a natural and constant fissure, closed by a very delicate membrane; the spoon-shaped process is narrow, and sustained by a buttress-like lamina. These shells are excessively delicate, and gape very much posteriorly.

He further remarks that in the *Anatina trapezoïdes*, of which Bruguière made a *Corbula*, and on which Schumacher founded his genus *Periploma*, the cardinal process or *cuslet* is in the shape of a wedge (point placed between the dorsal border and the spoon-shaped process; the umbo is not slit, and the shell, which is very inequivalve, does not gape.

A quadrangular osseous plate applied along the border, and sustained between spoon-shaped processes, which are very narrow and do not project, characterises another genus, to which M. Deshayes has given the name of *Osteodesma*. Example, *Osteodesma corbuloides* (*Mya Norvegica*, Linnæus; *Amphidesma corbuloides*, Lam.). The *Anatina longirostris* of Lamarck belongs to this genus.

Finally, M. Deshayes remarks that the *Anatina myalis* of Lamarck appears to have no *osselet* at the hinge, but its ligament and spoon-shaped processes have a particular form. On this species Dr. Leach founded his genus *Thracia*, which M. Deshayes adopts, and to which he has added many species.

Thus, M. Deshayes reduces the true *Anatinæ* to three species only, and from the other species adds the genera *Periploma*, Schum., *Osteodesma*, Desh., and *Thracia*, Leach. These may be comprised under the family name of *Anatinidæ*.

We select as an example one of the true *Anatinæ*, viz. *Anatina subrostrata*.

Description.—Shell ovate, membranaceous, anterior side attenuated and subrostrated.

Locality.—Seas of New Holland. Lamarck adds, the Indian Ocean.

Anatina Subrostrata.

a, inner view of valve, showing the hinge, &c.; b, external view; valves closed.

Habits.—The *Anatinæ* have hitherto been found for the most part in sands and shallow water.

Mr. Cuming informs us that he has brought home several new species of *Anatinidæ* from the Philippine Islands.

Anatina prismatica and *costata*, described by Mr. G. B. Sowerby, from Mr. Cuming's 'Western Voyage' (*Zool. Proc.*, 1834, *Müller*, *Syn.*), are not noticed in the last edition of Lamarck (1835), nor are *Periplomata lenticularis* and *planiuscula* described by Mr. G. B. Sowerby from the same collection (*loc. cit.*). M. Deshayes (ed. Lam.) observes that he knows but of one species of *Periploma*, viz. *Periploma inæquivalvis*.

Mya.

Generic Character.—*Animal* oblong, a little compressed, enveloped in a rather delicate mantle adhering by its borders, closed by a membranous lamina and forming backwards round the tubes a loose envelope in which they are withdrawn; tubes united, of moderate length, a little separated at their summit and radiated at their orifices; foot very small, conical, coming out of the mantle by a small slit situated at its antero-inferior border, in the median line; branchiæ moderate, not much elongated, unequal on the same side; mouth small, having triangular appendages striated like the branchiæ.

Shell enveloped with an epidermis prolonged upon the tubes and mantle of the animal, rather solid, gaping at both extremities, equivalve; umbones projecting but little; hinge composed of one or two oblique folds, diverging backwards from a horizontal, compressed, spoon-shaped process, belonging to the *left* valve and corresponding to an equally horizontal fosset in the *right* valve; ligament internal, inserting itself between the fosset and the spoon-shaped process; muscular impressions distant, the anterior elongated, the posterior rounded; pallial impression narrow and deeply excavated. (Rang.)

M. Deshayes, in the last edition of Lamarck, states that there are some species which so connect the *Myæ* with the *Sphenæ* of Turton, that their genus is only to be determined arbitrarily, and he cites for example *Mya plana*, *subangulata*, and *gregaria* of Sowerby (*Min. Conch.*), in support of this observation. He remarks that between the *Sphenia* and the *Corbulæ* properly so called, there exists an insensible transition which permits the separation of the two groups still less than the *Myæ*, and adds that an attentive examination of more than forty species of *Corbulæ*, both living and fossil, discovered to him the relationship which they bear to the *Myæ*. M. Deshayes concludes by observing, that if one could suppose the spoon-shaped processes of the *Myæ* to become flexible, and for it to be possible to bring them to the horizontal position from the perpendicular, we should evidently have the hinge of a *Lutraria*; but by stopping the bend of those processes at about an angle of forty-five degrees, we should have the hinge of *Anatina globulosa*, the *Tugon* of Adanson (*Mya Tugon*, Desh., *Encycl. Méth.*), which is in fact intermediate between the *Myæ* and the *Lutrariæ*.

The number of species given in the Tables of M. Deshayes is four living and five fossil (tertiary); *Myæ truncata*, *arenaria*, and *Tugon* are recorded as both living and fossil (tertiary). In the last edition of Lamarck four species only are given, and two of these are noted by M. Deshayes as not being *Myæ*, viz. *Mya erodona*, which he states to be a *Corbula*, and *M. Solemyalis*, which belongs to his genus *Osteodesma*, as already mentioned.

Habits of the Genus.—The Myæ live buried in sandy beaches, wherein they often lie with the tube just projecting; they are also found in the silt of estuaries.

Example, *Mya arenaria*.

Description.—Shell ovate, rounded anteriorly. The subjoined cut shows the hinge, muscular impressions, markings, and general form of the shell.

Locality.—British Channel, European seas.

Mya arenaria.

Lutricola.

Generic Character.—Body oval, very much compressed or subcylindrical, the mantle only closed in the half of its lower border; foot small, projecting but little beyond the abdominal mass; tubes long, distinct or united.

Shell oval or elongated, regular, equivalve, more or less inequilateral, sometimes scarcely gaping, the edges constantly simple and trenchant, the umbones but little marked; hinge subsimilar, formed of two very small diverging cardinal teeth, sometimes effaced before a large triangular fosset; ligament double, the external posterior rather small, the internal much thicker, and inserted in the fossets; two distinct muscular impressions united by a pallial impression, which is deeply sinuous backwards. (De Blainv.)

M. de Blainville divides the genus *Lutricola* into the two following sections:—

A.

Oval or orbicular species nearly equilateral, very much compressed, gaping but little; hinge similar; internal ligament inserted in the fosset of a vertical spoon-shaped process; two distinct tubes. (Genus *Ligula*, Leach.)

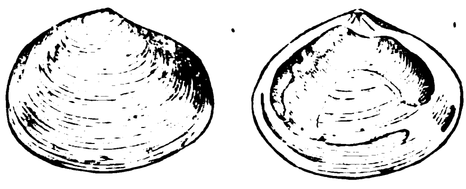
*

Without longitudinal striæ.

Example, *Lutricola compressa.*

Description.—Shell somewhat thin, compressed, rounded-trigonal, squalid, transversely striated, dirty grey, sometimes yellowish or reddish.

Locality.—British Channel.



Lutricola compressa.

B.

Striæ from the umbo to the base.

Example, *Lutraria rugosa* (*Mactra rugosa*, Gm.).

Locality.—European seas.

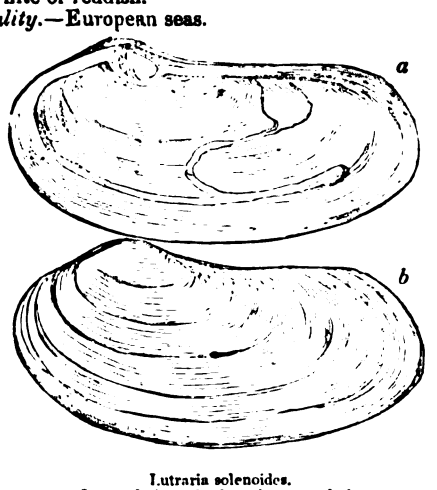
B.

Oblong species, subcylindrical, gaping very much; two very strong hinge-teeth; spoon-shaped process of the ligament vertical. (Genus *Lutraria*, Lam.)

Example, *Lutraria solenoïdes* (*Mya oblonga*, Gm.; *Mactra hians*, Dilw.).

Description.—Shell oblong, with transverse rugiform striæ, anterior end very long, apex rounded, gaping much; dirty white or reddish.

Locality.—European seas.



Lutraria solenoides.
a, Internal view of valve; *b*, external view.

M. de Blainville observes that the species of this genus belong generally to the seas of Europe, three only out of eleven recent species coming from the Indian Ocean. He notices one fossil species from the *faluns* of Touraine.

The genera above collected under the name of *Lutricola* by M. de Blainville belong to the genus *Lutraria* of Lamarck, in the last edition of whose *Animaux sans Vertèbres* M. Deshayes remarks that notwithstanding the observations of Lamarck, the *Lutrariæ* are not so clearly distinguished from the *Mactræ* as one might think. Moreover, he observes, there is so close a resemblance between the animals of the two genera, when deprived of the shell, that it would be impossible to distinguish them; and if the shells themselves be examined, an insensible transition will be found between them and those of the Mactræ. In the two first species of *Lutraria* (*solenoïdes* and *elliptica*) are found a spoon-shaped process and the cardinal tooth in the form of a V, as in the *Mactræ;* the lateral teeth are effaced or rudimentary; but in the third species (*L. rugosa*) the lateral teeth, though very short, show themselves nevertheless as strongly as in many species of *Mactræ*, and if this species preserving the external form of the *Lutrariæ* be followed by *Mactra striatella* and some others, the passage between the genera will be established; for it is impossible to find in the hinges of these species sufficing generic characters. If these three species of Lutrariæ, continues M. Deshayes, pass insensibly into the *Mactræ* [Conchacea, vol. vii., pp. 430, 431], it is different with regard to the greater part of the second section (*L. compressa*, *L. tellinoïdes*, &c.), which bear more resemblance to *Amphidesma* [Conchacea, vol. vii., pp. 429, 430]. Nevertheless those species preserve some traits of resemblance to the *Lutrariæ* which ought not to be neglected. The animals of these species approach more to that of the *Tellinæ* [Conchacea, pp. 428, 429], in the form and length of their siphons, than to those of the *Lutrariæ* and *Mactræ;* so that till the relationships shall be definitively fixed, it will be better to retain the genus *Ligula*, instituted for them by Dr. Leach.

Habits.—Sandy beaches are the localities in which the *Lutrariæ* are principally found buried.

The number of species given in the Tables of M. Deshayes is eleven recent and six fossil (tertiary). *Lutrariæ elliptica*, *rugosa*, and a new species are recorded as both living and fossil (tertiary). In the last edition of Lamarck sixteen species are described: of these *Lutrariæ solenoïdes* and *elliptica* are noted as recent and fossil; and *Lutrariæ crassidens*, *latissima*, and *sanna* as fossil only.

The place of the genus *Anatinella* (G. B. Sow.) is, in the opinion of M. Deshayes, between the *Lutrariæ* and *Thraciæ*, and that of *Cumingia* (G. B. Sow.) [Conchacea, vol. vii., p. 430], between the *Lutrariæ* of the second section and the *Amphidesmata*. The genus *Lyonsia* of the last-named author (*Zool. Proc.*, 1834; Müller, *Syn.*) appears to belong to the *Anatinidæ*. It is placed by Müller immediately before *Anatina*, and under the family *Myacea*, Mke.

Section 2. (Ligament external and convex.)

Psammocola.

Of the genera, or rather subgenera, enumerated by M. de Blainville, and noticed in the article Psammocola, M. Deshayes is of opinion that the genus *Psammobia* should be retained. It comes near to the *Tellinæ*, differing from them more in the shell, which has not the irregular posterior bend, than in the animal, if reference be made only to the figure of Poli. The species figured by MM. Quoy and Gaimard, in the 'Voyage of the Astrolabe,' presents particular characters, observes M. Deshayes, different from those which *Tellinæ* have hitherto shown. *Psammotæa*, he thinks, should not be continued as a genus. (Edit. Lam.)

The species are numerous. In his Tables M. Deshayes gives eighteen as the number of recent *Psammobiæ*, and notices four as fossil (tertiary). *Psammobiæ vespertina* and *muricata* he notes as both living and fossil (tertiary). The number of species of *Psammotæa* recorded is eight recent and one fossil.

Habits of Psammobia.—Species of this genus have been found in sands at depths varying from near the surface to thirteen fathoms.

Mr. Garner, in his paper on the *Lamellibranchiata* above quoted, gives figures of the animal of *Psammobia florida* in its shell and out of it.

Soletellina.

Generic Character.—Animal unknown.

Shell oval oblong, compressed, with sharp edges, but curved; equivalve, subequilateral, much more wide and rounded at the cephalic extremity than at the other, which is more or less attenuated and subcarinated; the umbones

Soletellina radiata.

subumbonal, not projecting much; hinge formed of one or two very small cardinal teeth; ligament thick, convex, and supported on very elevated nymphal callosities; two rounded, distant, muscular impressions; pallial impression very sinuous backwards. (Blainv.)

M. de Blainville observes that this genus, which he instituted for four or five species of Lamarck's *Solens*, differs very little from *Psammobia*.

Example, *Soletellina radiata*, (*Solen rostratus*, Lam.).

Description.—Shell transversely oblong, violaceous, with many obscure rays; anterior side attenuated and rostrated.

Locality.—Oriental seas.

M. Deshayes observes that *Solen violaceus* and *S. rostratus*, Lam., are referred to the genus *Soletellina* of De Blainville; but he thinks, from the characters of the shells, they ought to belong to *Psammobia*. The animals are unknown.

Sanguinolaria.

Generic Character.—*Animal* very like that of *Psammobia florida*. (Garner, 'Zool. Trans.,' vol. ii., pl. 18, figs. 1, 2.)

Shell oval, a little elongated, very much compressed, hardly gaping, equivalve, subequilateral, equally rounded at both extremities, without any posterior curvature; umbones slightly indicated; hinge formed of one or two approximated cardinal teeth in each valve; ligament projecting, convex; two rounded muscular impressions, which are distant and united by a narrow pallial impression, which is very sinuous backwards. (Blainv.)

Example, *Sanguinolaria livida*.

Both M. de Blainville and M. Rang state that the animal of *Sanguinolaria* is unknown.

Animal of Sanguinolaria residing in the shell. (Poli.)

Shell radiated and spotted with whitish and red.

Locality.—Mediterranean.

M. de Blainville speaks of this genus as differing but little from the preceding, and indeed most malacologists have felt the difficulty of discriminating between these closely similar forms. Of the four species recorded by Lamarck, M. Deshayes says that the three first, viz. *Sanguinolaria occidens*, *rosea*, and *livida*, are *Psammobiæ*; and that the last, *Sanguinolaria rugosa*, ought alone to remain as a species of the genus. He remarks that Mr. G. B. Sowerby, who has perceived the necessity of reforming the genus, has preserved *Solen sanguinolentus* as its type, joining to it those Solens of which M. de Blainville makes his *Soletellinæ*, whilst he places among the *Psammobiæ* the two species which, in the opinion of M. Deshayes, are true *Sanguinolariæ*. M. Deshayes does not admit Mr. Sowerby's opinion, not only because it is posterior to his own, but also because he believes that all the *Sanguinolariæ* of Sowerby have the characters of *Psammobiæ*, which is not the case with the species (*Sanguinolaria rugosa* ?) which he retains.

Shell of Sanguinolaria rosea. (Psammobia rosea, Desh.)

This species, he observes, is not compressed and tellinoid; it is thick, regular, pretty well closed, and very long and very thick *nymphæ* give insertion to a very convex and thick external ligament. The cardinal teeth in each valve, continues M. Deshayes, are two; the largest are bifid and convergent; the muscular impressions are nearly equal and rounded, and the pallial impression forms on the posterior side a narrow and but deep sinuosity.

Description.—Shell semiorbicular, slightly convex, white, with rosy umbones; the striæ transverse and arcuate.

Locality.—Jamaica. (Lam.)

Habits.—*Sanguinolariæ* have been found in sands and sandy mud, at depths varying from five to thirteen fathoms.

Mr. Cuming informs us that he has collected several new *Sanguinolariæ* and *Soletellinæ* at the Philippine Islands, &c.

Solecurtus.

Generic Character.—Both M. de Blainville and M. Rang mention the animal of *Solecurtus* as unknown. But see Poli (*Test. utriusque Siciliæ*, vol. i., tab. xiii.), and No. 172 E of the *Preparations of Natural History in spirit*, in the museum of the College of Surgeons.

M. de Blainville separates his *Solecurtus* into the following sections:—

A.

Flat, delicate species with an interior bar running obliquely from the umbo to the abdominal edge.

Example, *Solecurtus radiatus*.

B.

More cylindrical species, without an internal bar.

Example, *S. strigilatus*.

C.

Species still more elongated and subcylindrical.

Example, *S. Legumen*.

M. Deshayes confines the genus to those species which have all the same character with *S. strigilatus*.

Generic Character.—*Animal* much too large for the shell; lobes of the mantle thick forward, soldered together on their posterior moiety, and prolonged on this side into two great unequal siphons united near their summit; foot linguiform, large, very thick; labial palps very long and narrow; branchiæ narrow and very long, extending throughout the length of the branchial siphon.

Shell oval-oblong, transverse, covered with undulating oblique and longitudinal striæ, gaping at both extremities. Hinge median, two cardinal teeth in one valve, one, rarely two, on the other, non-intrant; nymphæ callous, thick, supporting an external and convex ligament; pallial impression very deeply sinuous. (Desh.)

M. Deshayes records four species:—1, *Solen strigilatus*, Lam.; 2, *Solen candidus*, Ren., living in the Mediterranean, and fossil in Sicily and Italy; 3, *Solen Quoyi* (*Voyage of the Astrolabe*, pl. 83, f. 11, 12, *Solen candidus*), South Pacific Ocean, smaller and proportionately wider than No. 2; 4, *Solen Parisiensis*, Desh. (*Solen strigilatus*, Lam., and of Deshayes, in *Desc. des Coq. Foss.*). This, which is fossil in the neighbourhood of Paris, Grignon, Courtagnon, Mouchy, Parnes, &c., had been previously confounded by M. Deshayes with *S. strigilatus*, Linn.

Example, *Solen strigilatus*.

Description.—Shell oval oblong, very convex, rosy with two white rays, sculptured with oblique striæ.

Locality, Mediterranean. Lamarck adds Atlantic Ocean.

Solen strigilatus.

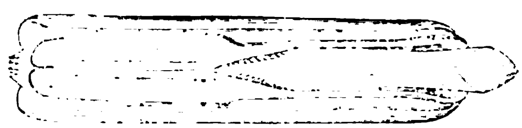
There is a fine specimen with the animal in the museum of the College of Surgeons (*Preparations of Nat. Hist. in spirit*, No. 172 E.).

Solen.

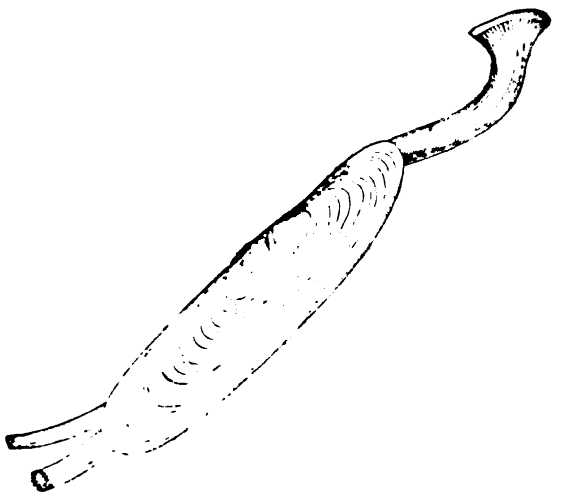
Generic Character.—Animal very much elongated, more or less cylindrical or compressed; mantle closed throughout its length, adhering by its borders, and bound to the lower edge of the shell by a double membrane, which folds back upon itself to form the epidermis, presenting backwards a single tube, double in the interior, conical, annulated, susceptible of much elongation, with two simple orifices, that of the siphon being greater than that of the anus; open entirely in front for the passage of a stout foot, which is conical, convex in its middle, pointed at its extremity, and which terminates the body of the animal in a straight line; branchiæ long, narrow, pointed backwards, nearly of equal size, adhering to two lines forward, one on each side of the body, uniting at last at a certain distance backwards on a single line, and then free and floating up to the entry of the siphon; labial appendages not striated like the branchiæ, elongated, triangular, recurved, and directing their point backwards: mouth small, anus at the extremity of a very small tube floating in the cavity above the free part of the branchiæ.

Shell rather delicate generally, translucid, equivalve, extremely inequilateral, elongated, gaping, truncated at both extremities, and with nearly parallel edges; umbones entirely anterior, hardly distinct; hinge composed of one or two teeth; ligament convex, slightly elongated; muscular impressions very distant, the anterior oblong, elongated, rather narrow, the posterior rather rounded; pallial impression straight, very long, terminated backwards by a short bifurcation. (Rang.)

In the second volume of 'The Descriptive and Illustrated Catalogue of the Museum of the College of Surgeons (Physiological Series),' will be found (pl. xix.) two figures of the soft parts of a Razor-shell (*Solen Siliqua*, Linn.), which will throw great light on the organization of this interesting genus. They are represented with the anterior extremity downwards (the natural position of the animal in the sand wherein it burrows when pressed so deftly that it requires sharp digging to overtake it), the anal and branchial tubes projecting from the surface when it is undisturbed, in order to maintain a communication with the sea-water. There may seem an apparent discrepancy between these accurate figures from the MS. catalogue of drawings (No. 28), and M. Rang's description in that part where he describes the mantle as closed throughout its length, and that part of the description of the plate which refers to 'the closed part of the mantle,' and 'the open part of the mantle.' The closed part of the mantle speaks for itself; the 'open part of the mantle' is evidently that which, in M. Rang's description, is 'bound to the lower borders of the shell.' The catalogue informs us that there is a third drawing (No. 29, M.S. Cat.), showing principally the viscera, which are placed at and in the basis of the pendulous body or foot. The mouth, the liver, the stomach, the intestines, and the anus are severally indicated.



Solen Vagina. Shell and soft parts.



Solen Legumen. Shell and soft parts.

The Catalogue further states that the branchiæ in this class of mollusks are composed of highly vascular membranes, supported by close-set parallel transverse filaments of a delicate horny texture: these are crossed at regular intervals by transverse lines or joints; and along either side of each supporting filament minute vibratile cilia are situated, which move rapidly in different directions, and excite and maintain a perpetual current of sea-water over the surface of the respiratory organs.

Pl. 18, fig. 8, of Mr. Garner's paper 'On the Anatomy of the Lamellibranchiate Conchifera,' shows the stomach, intestine, heart, &c. of *Solen Ensis*. Mr. Garner observes that in *Solen, Hiatella, Pholas*, &c., the branchiæ are prolonged into the inferior siphon, and so get access to the interior interlaminary spaces of the *branchiæ* (oviducts of some); and by the superior siphon, the *ova, fæces*, and secretions are discharged.

Habits of the Genus.—The species live in sandy beaches, wherein they often lie buried in a vertical position two feet deep, though their ordinary habit is to go only so low in the sand or silt (for they are found also in æstuaries) as to leave the tube just projecting. They may be said to have regular burrows. When the animal is undisturbed and the tide is in, it lies with the tubes at the entrance of its perpendicular hole; if it be disturbed, down it goes: in short its life is spent in descending to the depths of its burrow and ascending from it again to the surface by means of the extension and contraction of its great muscular foot, which is situated at that part of the shell which is lowest. They have been found at depths varying from near the surface of the sea to thirteen fathoms.

Localities. — Mediterranean. Lamarck adds Atlantic Ocean.

Shell of Solen Ensis.
a, external view of valves closed; *b*, internal view of valve.

Locality.—Seas of Europe and America. (Lam.)

M. de Blainville thus divides the genus:—

A.

Species somewhat curved longitudinally; umbo not terminal.

Example, *Solen cultellus*.

B.

Species straight, or hardly curved; umbo terminal.

Example, *Solen Vagina*.

M. Deshayes, in his Tables, makes the number of recent species of Solen twenty-six; and nineteen the number of the fossil (tertiary). He records *S. Vagina, Legumen, coarctatus, strigilatus, candidus*, and *Siliqua*, as found both in a living and fossil (tertiary) state; and *Solen siliqua* ... as being found in more than one tertiary formation. This number includes *Solecurtus*. In the last edition of Lamarck, the number of species, including *Solecurtus*, &c., is twenty-one in all; but with regard to *Solen Vagina*, M. Deshayes remarks, that having seen the types in Lamarck's collection, he is sure that the three varieties constitute three distinct species; and he adds that Lamarck, misled by a resemblance in the external form, has given as the fossil analogue of var. b. *Solen Vagina abbreviata* (Rumph., *Mus.*, t. ..., f. M.).

The genus *Solenella* of Mr. G. B. Sowerby (*Zool. Proc.*, 1832; Müll., *Syn.*), a marine genus allied to *Solecurtus* of M. de Blainville, may here be noticed. In it the general form and characters of *Solecurtus* are combined with a series of minute sharp teeth characteristic of *Nucula*. Mr. Sowerby states that it appears to belong to the family of the *Solenaceæ*, and that it may be at once separated from the *Mactraceæ*, to which, in his opinion, *Nucula* belongs, by the circumstance of the whole of the ligament being external. Established on *Solenella Norrisii*, which was found by Mr. Cuming at Valparaiso.

Solemya.

Generic Character.—*Animal* oval, transverse; lobes of the mantle united for their posterior half, terminated by two short and unequal siphons; foot proboscidiform, truncated anteriorly by a disk, or kind of sucker, the borders of which are fringed; a single branchia on each side in form of a pinnule, the limbs of which are united up to the base; anus terminal, not floating. (Deshayes.)

Shell very delicate, fragile, compressed, elongated, rounded at its extremities; the borders straight and parallel, gaping a little backwards, regular, equivalve, very inequilateral, covered with a shining epidermis which invests it on all sides, except in front and behind; anterior side much longer than the posterior; umbones but little distinct; hinge composed of a cardinal, dilated, compressed tooth, which is very oblique, a little curved above, serving for the insertion of the ligament in each valve; ligament almost entirely posterior; muscular impressions small, rounded, distant; some traces of a pallial impression. (Rang.)

M. Deshayes remarks that *Solemya*, perfectly characterised by the structure of the *branchiæ*, approaches the *Solens* more than any other genus in the rest of its organization. He adds that he had thought, before the animal of *Glycymeris* was so completely known, and from the resemblance of the shells, that *Glycymeris* and *Solemya* ought to be placed at the commencement of the family of *Solens*. Only three species appear to be known, *Solemya Australis*, *Mediterranea*, and *Borealis*. The first from New Holland; the second, as the name implies, from the Mediterranean; and the last from North America (Rhode Island).

Habits of the Genus.—Sands are the localities in which the genus has been found.

Panopæa.

Generic Character.—Animal unknown.

Shell thick, solid, convex, oblique, elongated, gaping at both extremities, equivalve, inequilateral, rather irregular; umbones well marked, contiguous, rather curved forward, and more approximated to the anterior than the posterior part; hinge presenting a conical tooth in each valve in front of a fossett, and of a thick callosity, not projecting outwards, and but little elongated, on which is inserted the external, posterior, and convex ligament; muscular impressions irregularly oval, the anterior the longest, both united by a pallial impression, which is wide, parallel to the border of the shell, and rather deeply excavated backwards. (*Rang.*)

M. Deshayes observes that when Lamarck published this part of his work, he knew but one species of *Panopæa*; but M. Deshayes, on examining his collection, found that his *Glycymeris Arctica* was of the former genus. At the time M. Deshayes made his Tables, the number of species recorded appears to have been two recent and three fossil (tertiary); and of these, *Panopæa Aldrovandi* is noted as both living and fossil (tertiary). Six (recent and fossil) is the number given by M. Deshayes in the last edition of Lamarck.

Habits of the Genus.—*Panopæa* has been found in sands and shallow water.

Glycymeris.

Generic Character.—Animal elongated, thick, cylindraceous, having the lobes of the mantle very thick, open only at the anterior extremity for the passage of a small cylindrical foot, and terminated posteriorly by two siphons, united into a single cylindrical very fleshy mass, and never capable of entering the shell; mouth moderate, oval, accompanied on each side by two large equal triangular palps, joined by their base to the anterior adductor muscle. Branchiæ long and thick, two on each side nearly equal. (Deshayes, after Audouin.)

Shell with a strong epidermis, elongated, rounded, gaping at both extremities, rather irregular, equivalve, very inequilateral; umbones projecting but little, skinned (écorchés); hinge toothless, presenting only a thick and but little elongated callosity; external ligament supported by *nymphæ* projecting outwards; muscular impressions distinct and very distant; pallial impression well marked, not excavated posteriorly; valves thickened by callosities in the interior. (Rang.)

The number of species in the Tables of M. Deshayes is one recent. In the last edition of Lamarck the same zoologist observes that he has examined the three shells comprised in Lamarck's genus, and that the first only (*Glycymeris Siliqua*) belongs to it. The second (*Glycymeris Arctica*) is, he adds, a true *Panopæa*; and the third (*Glycymeris margaritacea*) is the detached valve of a *Clavagella*, from Grignon.

Habits of the Genus.—Found on sands: moderate depths.

Saxicava. [Lithophagidæ, vol. xiv., p. 39.]

Byssomya. (See the article.)

Rhomboides.

Generic Character.—*Animal*—Very rhomboidal, elongated, rather compressed, with two distinct tubes backwards; a rather wide slit at the anterior and inferior part of the mantle for the exit of a small conical foot, with a byssus the filaments of which are enlarged at the extremity.

Shell rhomboidal, rather irregular, striated longitudinally, very inequilateral; umbones very distinct and very anterodorsal; hinge formed by two small cardinal teeth; ligament external, posterior, rather projecting; two rounded muscular impressions.

Example, *Rhomboides rugosus*, Poli, t. 2, p. 21, tab. xv., f. 18.

M. de Blainville established this genus upon a small mollusk figured and described by Poli under the name of *Hypogæa barbata*, and which he refers to the *Mytilus rugosus* of Gmelin. The animal, continues M. de Blainville, is tolerably like *Byssomya*; but the shell is entirely different, and would belong to the genus *Petricola* of Lamarck; but it does not perforate, and lives affixed to rocks by its byssus. M. de Blainville concludes by observing that the genus would perhaps be better placed among the irregular *Venerea*. M. Rang thinks that the genus comes extremely near to *Byssomya*.

Hiatella.

Generic Character.—*Animal* unknown. Shell delicate, elongated, subrhomboidal, equivalve, very inequilateral, gaping at its inferior border and posterior extremity; umbones very anterior and curved forwards; hinge dorsal, formed of a single tooth in one valve corresponding with a notch in the opposite valve, or of a small tooth with a cardinal fossett on each valve; ligament probably external and dorsal; muscular and pallial impressions unknown. (De Blainville.)

M. de Blainville divides the genus into the following sections:—

A.

Species with a tooth in one valve only.

Example, *Hiatella biaperta*.

B.

Species with a small tooth on each valve. (Genus *Biapholius*, Leach.)

Example, *Hiatella Arctica* (*Mya Arctica*, Oth., Fabr.). M. de Blainville remarks that this genus, established by Daudin, is but badly known, and that it contains but three living species, two from India and the other from the North Seas.

M. Rang, who remarks also on the incomplete knowledge of this genus, thinks that this, perhaps, is not the place for it.

Gastrochæna. (See the article.)

Clavagella. (See the article.)

Aspergillum. (See the article and Tubicolidæ.)

Fossil Pyloridea.

Our limits will not permit more than a reference to the information given under the heads of the respective genera, and the statement that *Gastrochæna*, *Panopæa*, *Mya*, *Lutraria*, *Psammobia*, *Sanguinolaria* ? and *Solemya* ? occur below the chalk. *Psammobia* and *Mya* are recorded by Mr. Murchison (*Silurian System*), the former as occurring in the lower Ludlow rock, the latter in the Aymestry limestone.

PYLO'RUS. [Digestion; Stomach.]

PYLOS. [Brasidas; Cleon; Messenia; Navarino.]

PYM, JOHN, was descended from a good family in Somersetshire, where he was born in the year 1584. It appears from the abstract of title to certain estates that John Pym was the lord of the manors of Woolavington Pym and Woolavington Throckmorton, near Bridgewater, in the county of Somerset. His son Sir Charles Pym, Bart., afterwards possessed these manors, which at his death descended on coheiresses, and ultimately by marriage passed into the family of Hales (of Kent), who became the representatives of the Pyms.

In the beginning of the year 1599, and the fifteenth year of his age, Pym became a gentleman-commoner of Broadgate Hall, now Pembroke College, Oxford. But he left the University without taking a degree, and went, as Wood supposes, to one of the inns of court.

Pym was early distinguished for his eloquence and knowledge in the common law. He served in several parliaments towards the end of the reign of James I., and in all those held in the reign of Charles I., as member for Tavistock in Devonshire. He soon distinguished himself in the house by his abilities and zeal in opposing the measures of the court.

In 1626 he was one of the managers of the articles of impeachment against the duke of Buckingham; and in the Short Parliament, which met on the 13th of April, 1640, he was one of the most active members. When the Long Parliament met (3rd of November, 1640), the value of Pym's knowledge and experience in the usages of the house, as well as of his talents as a speaker, was strongly felt. The reason of this is made apparent by the following words of Clarendon:—'The long intermission of parliament,' he says, 'having worn out most of those who had been acquainted with the rules and orders observed in those conventions' (*Hist.*, vol. iv., p. 437, Oxford, 1826).

On the 7th of November, the first day in which the house entered upon business, Pym made a long speech respecting grievances. He classed them under three heads, namely: 1, privilege of parliament; 2, religion; 3, liberty of the subject. Each of these divisions, as was usual in that age, he again divided into a great number of subdivisions.

The style of Pym's oratory, as far as we can judge of it from those speeches of his which were printed at the time, and have come down to us among the innumerable small quartos of that age which are preserved in the British Museum, is nervous, terse, and polished.

Upon the 11th of November a motion was suddenly made by Mr. Pym, who declared that he had something of importance to make known to the house, and desired that the outward room should be cleared of strangers, and the outer doors upon the stairs locked. This being done, Pym began. He alluded by way of exordium to the grievances under which the nation laboured. He inferred from these that a deliberate plan had been formed of entirely changing the frame of government. Then he thus continued:—'We must inquire from what fountain these waters of bitterness flow; what persons they are who have so far insinuated themselves into his royal affections as to be able to pervert his excellent judgment, to abuse his name, and wickedly apply his authority to countenance and support their own corrupt designs. Though he doubted not there would be many found of this class who had contributed their joint endeavours to bring this misery upon the nation; yet there was one who both by his capacity and inclination to do evil enjoyed an infamous preeminence; a man who in the memory of many present had sat in that house, an earnest vindicator of the laws, and a most zealous assertor and champion of the liberties of the people; but he had long since turned apostate from those good affections, and, according to the custom and nature of apostates, was become the greatest enemy to the liberties of his country, and the greatest promoter of tyranny that any age had produced.' He then named 'the earl of Strafford, lord-lieutenant of Ireland, and lord president of the council of York, who, he said, had in both places, and in all other provinces wherein his services had been used by the king, raised ample monuments of his tyrannical nature; and that he believed if they took a short survey of his actions and behaviour they would find him the principal author and promoter of all those counsels which had exposed the kingdom to so much ruin.'* He then instanced some imperious actions done by him in England and Ireland, some proud and over confident expressions in discourse, and certain passionate advices he had given in the most secret councils of state; adding, says Clarendon, some lighter passages of his vanity and amours; and so concluded, 'that they would well consider how to provide a remedy proportionable to the disease, and to prevent the further mischiefs they were to expect from the continuance of this great man's power and credit with the king, and his influence upon his counsels.'†

It is unnecessary to detail here the impeachment of Strafford, which followed, and in which Pym bore so prominent a part. On the 25th of November (1640), at a conference between the two houses in reference to the subject of this impeachment, Mr. Pym made a speech, in which he attempted with considerable though unsuccessful ingenuity to prove that the earl of Strafford was guilty of treason, on the ground that 'other treasons are against the rule of the law; but this is against the being of the law.' The laws against treason in England having been made to protect the king, not the subject, it would be in vain to look in the Statute of Treasons, the 25th Edw. III., st. 5, c. 2, which at that time

constituted the English law of treason (the statutes of Henry VIII., making so many new treasons, having been repealed by 1 Mary, c. 1), for any definition or description, or even any mention of that of which Strafford was accused, viz. an attempt to increase the power of the king, and to depress that of the subject. Pym was partly aware of this, and he endeavoured to meet it by saying that this treason of which he speaks 'is enlarged beyond the limits of any description or definition.'

On the 26th of February, 1640, when the articles against Laud had been read, Pym made a powerful speech against him. By a somewhat quaint ingenuity he applies to Laud the expression, 'Spiritual wickednesses in high places.' 'My lords, there is an expression in the Scripture which I will not presume either to understand or to interpret; yet to a vulgar eye it seems to have an aspect something suitable to the person and cause before you. It is a description of the evil spirits, wherein they are said to be spiritual wickednesses in high places; crimes acted by the spiritual faculties of the soul, the will and understanding exercised about spiritual matters concerning God's worship and the salvation of man, seconded with power, authority, learning, and many other advantages, do make the party who commits them very suitable to that description, "spiritual wickednesses in high places."'*

He says afterwards, 'It is a miserable abuse of the spiritual keys to shut up the doors of heaven, and to open the gates of hell; to let in profaneness, ignorance, superstition, and error.'

We are furnished by Clarendon with some interesting information respecting the manner of life about this time of Pym and one or two of his illustrious friends. 'When Mr. Hyde sat in the chair,' says Clarendon, 'in the grand committee of the house for the extirpation of episcopacy, all that party made great court to him (Clarendon); the house keeping those disorderly hours, and seldom rising till after four of the clock in the afternoon; they frequently importuned him to dine with them at Mr. Pym's lodging, which was at Sir Richard Mauly's house, in a little court behind Westminster Hall, where he and Mr. Hambden, Sir Arthur Hazlerig, and two or three more, upon a stock kept a table, where they transacted much business; and invited thither those of whose conversion they had any hope.'†

Clarendon also mentions that they sometimes went out after dinner to ride in the fields between Westminster and Chelsea.

At the conference held between the two houses on the 25th of January, 1641, on presenting to the lords certain petitions which the Commons had received from various parts of the kingdom, London, Essex, &c., Mr. Pym made a speech, concluding with the following remarkable peroration:—'I am now come to a conclusion, and I have nothing to propound to your lordships by way of request or desire from the House of Commons. I doubt not but your judgments will tell you what is to be done; your consciences, your honours, your interests will call upon for the doing of it; the Commons will be glad to have your help and concurrence in the saving of the kingdom; but if they should fail of it, it should not discourage them in doing their duty. And whether the kingdom be lost or saved (as through God's blessing I hope it will be), they shall be sorry that the story of this present parliament should tell posterity that in so great a danger and extremity the House of Commons should be enforced to save the kingdom alone, and that the House of Peers should have no part in the honour of the preservation of it, you having so great an interest in the good success of those endeavours in respect of your great estates and high degrees of nobility.

'My lords, consider what the present necessities and dangers of the commonwealth require; what the Commons have reason to expect; to what endeavours and counsels the concurrent desires of all the people do invite you: so that applying yourselves to the preservation of the king and kingdom, I may be bold to assure you, in the name of all the commons of England, that you shall be bravely seconded.'‡

'A Speech delivered at a Conference with the Lords, January 25, 1641,' 4to., 1641.

Die Martis, 25th January, 1641.

'It is this day ordered by the Commons House of Parliament, that Mr. Speaker, in the name of the house, shall give thanks unto Mr. Pym for his so well performing the service he was employed in by the Commons of the

It will convey some idea of the effect of Pym's eloquence to state that when he made his celebrated speech at Guildhall, the acclamations were so loud at the end of every period, that he was frequently compelled to remain silent for some minutes. So great indeed were his power and popularity, that he received the appellation of King Pym.

The influence of Pym on the councils of the parliament having exposed him to the chief odium of the opposite party, he some time before his death, in 1642, published a vindication of his conduct, in answer to the reproaches of having been the promoter of all the innovations which had been introduced into the church of England, and the person who had produced all the evils which then afflicted the kingdom. In this paper he declared that he was and ever had been and would die a faithful son of the Protestant religion, without having the least tincture of anabaptism, Brownism, and the like errors; and he justified his consenting to the abolishment of episcopacy. With regard to the reports of his being the author of the differences then subsisting between the king and his parliament, he affirmed that he never had a single thought tending to the least disobedience or disloyalty to his majesty, whom he acknowledged for his lawful sovereign, and would spend his blood as soon in his service as any other subject in the kingdom. That it was true, when he perceived his life aimed at, and heard himself proscribed as a traitor, he had fled for protection to the parliament, who justly acquitted him and the other gentlemen accused with him of the guilt of high treason. If this therefore had been the occasion of his majesty's withdrawing from the parliament, the fault could not in any measure be imputed to him, or to any proceeding of his which had never gone further, either since his majesty's departure or before, than was warranted by the known laws of the kingdom and the indisputable power of the parliament.*

In November, 1643, Pym was appointed lieutenant of the ordnance. He died at Derby House, on the 8th of December of the same year, and on the thirteenth of that month he was buried in Westminster Abbey, his body being carried to the grave by six members of the House of Commons. He left several children by his wife, a woman of singular accomplishments, who died about the year 1620.

'As his life, such was his death,' says one who stood by him when he lay on his death-bed.† He enjoyed, all the time of his illness, the same 'evenness of spirit' which he possessed in health, with an addition of a more 'clear evidence of God's love in Jesus Christ,' and a most ready subjection to God's will, declaring to Marshall that 'it was to him a most indifferent thing to live or die: if he lived, he would do what service he could; if he died, he should go to that God whom he had served, and who would carry out his work by some others.' A little before his end, having recovered out of a swoon, and seeing his friends weeping around him, he cheerfully told them he had looked death in the face, and knew and therefore feared not the worst it could do, assuring them his heart was filled with more comfort and joy, which he found and felt from God, than his tongue was able to utter.

A report was put in circulation by his enemies that Pym died of the loathsome disease called *morbus pediculosus*. However there exists a document, attested by seven physicians, two surgeons, and one apothecary, which states that the disease of which he died was an imposthume in the bowels. And Ludlow mentions that Pym's body was for several days exposed to public view in Derby House, before it was interred, in confutation of those who reported it to be eaten with lice.‡

PYNAKER, ADAM, a celebrated landscape painter of the Dutch school, was born in 1621, at the village of Pynaker, between Schiedam and Delft, and always retained the name of the place of his birth. It does not appear under what master he studied; he went however to Rome for improvement, and remained three years in that city, where he made such good use of his time, that he returned to his own country with the reputation of an excellent painter. He in general preferred a strong morning light, which allowed him to give his trees a more lively verdure. His landscapes are enriched with picturesque ruins or fine buildings, and his figures are spirited and suitable to his subjects. He is much esteemed for the skill with which, by a judicious disposition of the ground, interrupted by breaks, and diversified by hills and valleys, he gives the effect of distance gradually receding from the view as far as the eye can reach. His larger pictures are by no means equal to his smaller ones, which are highly esteemed. They are very scarce, in this country at least; for Dr. Waagen does not appear to have met with even one, in any of the great collections which he visited, and which are described in his work 'On the Arts in England.' In his volume on France he mentions several which he saw in the galleries of Paris. Pynaker died in 1673, at the age of 52.

PYRALLOLITE occurs crystallized and massive. Primary form, according to Lévy, an oblique-angled parallelopiped. Cleavage parallel to the two lateral faces of the primary form, and to one of the diagonal planes. Fracture earthy. Hardness, scratches carbonate of lime, and is scratched by felspar. Colour white and greenish; transparent on the edges; lustre resinous. Specific gravity 2·55 to 2·69.

Before the blowpipe, becomes at first black, and afterwards white; swells and fuses on the edges into a glass; with borax gives a transparent glass.

Massive Variety.—Yellowish, in small laminar masses, with white carbonate of lime, red phosphate of lime, and green pyroxene.

Occurs at Storgard, Pargas, Finland.

Analysis by M. Nordenskiöld:—

Silica, 56·62; magnesia, 23·38; alumina, 3·38; lime, 5·58; oxide of iron, 0·99; oxide of manganese, 0·99; water, 3·58.

PYRAMID (πυραμίς), a solid figure contained by a polygonal base, and the triangles formed on the sides of the base by lines drawn from one point to the angles of the base. It is among plane solids what the cone is among curvilinear ones, and its solid content is one third of that of a prism of the same base and altitude; that is, the number of square units in the base, multiplied by the number of linear units in the altitude, and the product divided by 3, gives the number of cubic units in the content.

The properties of a pyramid are important in the theory of PROJECTIONS, particularly the following:—Every quadrangular pyramid (or pyramid with a quadrangular base) has one section, and one only, which is a parallelogram. To find it, let the vertex be V, and let opposite sides of the base meet in A and B. Then every plane parallel to AVB cuts the pyramid in a parallelogram, one of whose angles is equal to the angle AVB.

PYRAMIDELLA, Lamarck's name for a genus of his *Plicacea*, and placed by M. de Blainville among his *Auriculacea*.

Generic Character.—Animal unknown.

Shell smooth, polished, without an epidermis, conical, elongated, or subturriculate; aperture oval from behind forwards; the outer lip extremely trenchant, toothed internally; the inner lip entirely formed by the tortuous and much plicated columella.

The number of species given in the Tables of M. Deshayes is eleven living and eight fossil (tertiary). *Pyramidellæ terebellata* and *acicula* are there noted as occurring in more than one tertiary formation. The living species inhabit the seas of warm climates in both the Old and New World.

PYRAMIDS. The pyramids of Egypt, especially the two largest of the pyramids of Jizeh, are the most stupendous masses of building in stone that human labour has ever been known to accomplish; and we have records of their having been objects of wonder and curiosity from the age of Herodotus, who was born 484 years B.C., to the present time.

The Egyptian pyramids, of which, large and small, and in different states of preservation, the number is very considerable, are all situated on the west side of the Nile, and they extend, in an irregular line and in groups at some distance from each other, from the neighbourhood of Jizeh, in 30° N. lat. as far south as 29° N. lat., a length of between 60 and 70 miles.

The pyramids of Jizeh are nearly opposite to Cairo. They stand on a plateau or terrace of limestone, which is a projection from the Libyan mountain-chain. The surface of the terrace is barren and irregular, and is covered with sand and small fragments of rock; its height, measured

House at this conference. And it is further ordered, that Mr. Pym be desired to put this speech he made at this conference into writing, and to deliver it unto this House, to the end it may be printed.

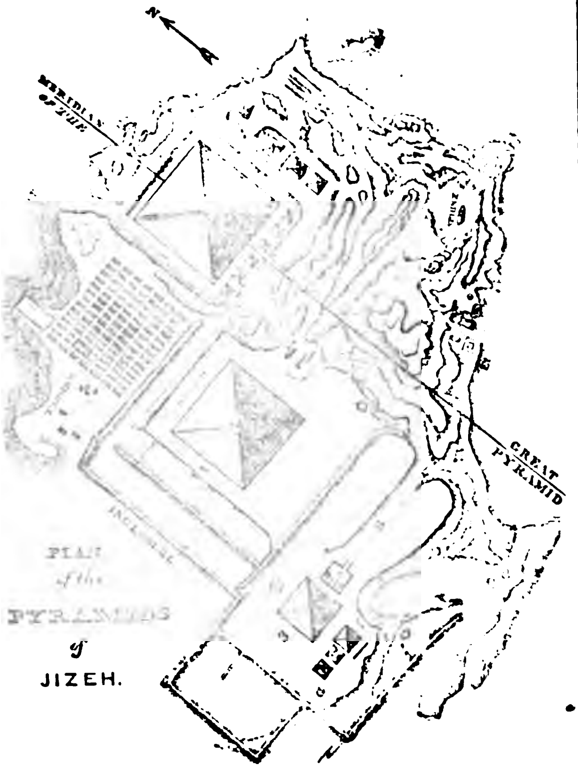
‡ Ludlow's 'Memoirs,' i. 75, fol., 1698, London, 1751.

from the base of the great pyramid, is 164 feet above the Nile in its low state, taken at an average of the years 1798 to 1801. The north-east angle of the great pyramid is 1700 yards from the canal which runs between the terrace and the Nile, and about five miles from the Nile itself. The accompanying plan, which is copied from the great French work, 'Description de l'Egypte,' shows the relative situations and sizes of these pyramids, and also the catacombs cut in the rock, the ruined buildings, and the great sphinx.



A, remains of an antient building; B, causeway; D, pyramids, dilapidated; G, pyramids with receding platforms.

Herodotus was informed by the priests of Memphis that the great pyramid was built by Cheops, king of Egypt, about 900 B.C., or about 450 years before Herodotus visited Egypt. He says that 100,000 men were employed twenty years in building it, and that the body of Cheops was placed in a room beneath the bottom of the pyramid, surrounded by a vault to which the waters of the Nile were conveyed through a subterraneous tunnel; a chamber under the centre of the pyramid has indeed been discovered, it is about 56 feet above the low-water level of the Nile. The second pyramid was built, Herodotus says, by Cephren, or Cephrenes, the brother and successor of Cheops; and the third by Mycerinus, the son of Cheops.

It will be seen, from the preceding plan, that there are three large pyramids and several smaller ones. All of them have square bases, and their sides face the cardinal points.

The pyramid of Cheops consists of a series of platforms, each of which is smaller than the one on which it rests, and consequently presents the appearance of steps, which diminish in length from the bottom to the top. Of these steps there are 203, and the height of them decreases, but not regularly, from the bottom to the top, the greatest height being nearly four feet and two-thirds (4·628), and the least rather more than one foot and two-thirds (1·686). The horizontal lines of the platforms are perfectly straight, and the stones are cut and fitted to each other with the greatest nicety, and joined by a cement of lime with little or no sand in it. It has been ascertained that a bed eight inches deep has been cut in the rock to receive the lowest external course of stones. The vertical height, measured from this base in the rock to the top of the highest platform now remaining, is 456 feet. This platform has an area of about 1067 square feet, each side being 32 feet 8 inches. If to this were added what is necessary to complete the apex of the pyramid, the total height would be about 479 feet. Each side of the base, measured round the stones let into the rock, is rather more than 763 feet (763·4), and the perimeter of the base is therefore 3053·6 feet. M. Jomard's figures differ a little from the above, in consequence of his measuring, not the lowest course of stones let into the rock, but the base of the steps which rest upon them. The whole height, according to him, would be nearly 473 feet, and he gives the following dimensions:—

	Feet
Diagonal of the base . . .	1069·[illegible]
Length of the edge, formed by the intersection of two adjacent sides . .	605·[illegible]

The following are the angles of the pyramid:—

	°	′	″
Angle of the base of the triangle forming one of the four faces	57	5[illegible]	[illegible]
Angle of the vertex of ditto	6[illegible]	[illegible]	
Angle of an edge with the diagonal of the base . .	41	[illegible]7	
Angle formed by two opposite edges . .	97	6	
Angle of the face with the plane of the base . .	51	1[illegible]	[illegible]
Angle of two opposite faces	77	[illegible]1	[illegible]

From this it appears that the faces of the pyramid are not equilateral triangles, as has sometimes been supposed.

The area of the base, measured along the outside of the stones let into the rock, is 64,753 square yards, or about 1[illegible] acres. This area is about the same as Lincoln's Inn Fields, London, measured by the wall of Lincoln's Inn garden and the sides of the houses within the court-yards. The surface of each face, not including the base let into the rock, is 25,493 square yards; and that of the four faces is consequently 101,972 square yards, or more than 21 acres. The solid content of the pyramid is about 3,394,307 cubic yards, which (not making any deductions for chambers and passages in it) has been estimated to be six times the mass of stone in the Plymouth breakwater. Reckoning the total height at 479 feet, the pyramid would be 15 feet higher than St. Peter's at Rome, and 119 higher than St. Paul's, London.

The entrance to the great pyramid is on the north face, about 47½ feet above the base, and on the level of the [illegible] step from the foundation. The entrance, which is nearly 21 feet east of the perpendicular which bisects the face, is easily reached by the mass of rubbish at the base, which has chiefly fallen from the top. The passage to which the opening leads is 3 feet 7½ inches square, with a downward inclination of 26°, or 26° 30′ at most. It is lined with slabs of limestone well joined together. This passage leads to another, which has an ascending inclination of 27°. The descending passage is 73 feet long to the place where it meets the ascending passage, 109 feet long, at the top of which there is a platform, with the opening of a well or shaft, which goes down into the body of the pyramid, and the commencement of a horizontal gallery 127 feet long, which leads to the queen's chamber, 17 feet long, 14 wide, and 12 high. But another passage or gallery 132 feet long, 26½ high, and nearly 7 wide, commences at the platform, and is continued in the same line as the former ascending passage, till it reaches a landing-place, from which a short passage leads to a small chamber or vestibule, whence another short passage leads to the king's chamber, which, as well as the vestibule and intermediate passage, is lined with large blocks of granite well worked. The king's chamber is [illegible] feet long, 17 wide, and 19¼ high. The roof is formed of nine slabs of granite reaching from side to side: the slabs are therefore more than 17 feet long by 3 feet 9½ inches wide. This chamber contains a sarcophagus of red granite; the cover is gone, having probably been broken, and carried away. The sarcophagus is 7 feet 6½ inches long, 3 feet 3 inches wide, and 3 feet 8½ inches high on the outside, the bottom being 7½ inches thick. There are no hieroglyphics upon it.

Mr. Davison, in 1763, discovered a chamber immediately over the king's chamber, which is reached by mounting by a ladder to a hole at the top of the upper ascending gallery, and Colonel Vyse has since (1836-7) discovered three other chambers, also above the king's chamber. All these chambers are from three to four feet longer than the king's chamber, and about the same width, the slabs which are the roof of the one forming the pavement of that which is above it; but none of them is much more than three feet high. They have probably been formed merely to lessen the weight of the mass above the king's chamber.

Captain Caviglia, in 1816, discovered that the entrance passage did not terminate at the bottom of the ascending passage, but was continued downwards in the same inclined plane 200 feet farther, and by a short horizontal passage opened on what appeared to be the bottom of the well. The passage however continued in the same direction 93 feet farther, then became narrower, and was continued horizontally 27 feet more, when it opened into a large chamber cut in the rock, and under the centre of the pyramid. This chamber is about 66 feet by 27. Another passage 55 feet long leads from this chamber, but it appears to terminate abruptly.

The well, which appeared to Mr. Davison and Captain Caviglia to descend no lower than where it was intersected by the descending passage, its depth there being 155 feet, was afterwards cleared out by the French to the depth of 207 feet, of which about 138 feet are in the solid rock; so that the base of the pyramid being 154 feet above the low-water level of the Nile, the present bottom of the well is 15 feet 6 inches above the Nile; but the actual bottom does not appear to have been yet reached. The temperature within the body of the pyramid was found to be 81° 5' Fahrenheit, and in the well it was still higher.

Herodotus was informed that the chambers cut in the solid rock were made before the building of the pyramid was commenced. It is evident that it was intended that the pyramid should not be entered after the body or bodies were deposited in it, as blocks of granite were fixed in the entrances to the principal passages in such a manner as not only to close them up, but to conceal them. There are traces however of the pyramid having been entered both by the Romans and the Arab conquerors of Egypt.

As the pyramids consist of a series of platforms, each smaller than the one on which it rests, the height of some of them being so much as five feet, and that height diminishing upwards, it is obvious that the stones could be lifted by manual labour and levers successively from step to step, so as to complete each platform before the next was commenced; but there is a passage in Herodotus respecting the building of this pyramid which is attended with a little difficulty. He says (ii. 125, 125), 'The pyramid was made in the following manner, in the form of steps, which some call crossæ (battlements), and others bōmides (little altars). When they had first built it in this fashion, they raised the remaining stones by machines or contrivances of short pieces of wood. They raised them from the ground to the first row of steps, and when the stone had ascended to this row, it was placed on another machine standing on the first row, and from this row it was dragged upon the second row on another machine. As many rows of stones as there were, so many machines also were there; but, according to another account (for I think it right to give both accounts as they were given to me), they transferred the same machine, it being easily moved from step to step as they raised each stone. The highest parts were accordingly finished first; then the parts next to the highest, and last of all the parts near the ground and the very bottom.'

The 'remaining stones' have sometimes been interpreted to mean casing-stones, similar to those which yet remain on the upper part of the pyramid of Cephren, and by which the whole surface was made smooth. And this indeed would be the only judicious way of putting on such a casing; otherwise, if they began from the bottom, the lower part of the pyramid would be rendered inaccessible, and the stones could only be carried up by external contrivances. There is no doubt that it had such a casing, but the difficulty is, that not a stone that can be proved to have belonged to it now remains either on or about the great pyramid. It is probable that the outer stones, which Herodotus says were highly polished, have been carried off for purposes of building, but it is extraordinary that not one should remain as a solitary witness for the veracity of the Father of History.

Herodotus also informs us, that when the great pyramid was designed, they began by making a causeway for the conveyance of the stone. This causeway was 3000 Greek feet in length, 60 in breadth, and 48 high at its greatest elevation. It was made of highly polished stone covered with sculptures; and in his opinion was as wonderful a work as the pyramid itself. Of this causeway however there are now no traces, though remains of causeways, along which the materials of the pyramids were probably conveyed, may be seen in many places, and particularly in that part of the plain marked H, where there is a causeway about 400 feet long, formed of very large stones, leading to the building A, on the east side of the third pyramid.

The materials of all the pyramids are limestone, and Jomard is of opinion that part of the stone for the second pyramid was procured immediately on the spot, judging from the manner in which the rock has been cut away round the pyramid. Herodotus certainly understood that all the stone was brought from the mountains near Cairo, where there are indeed ancient quarries of great extent; but it seems probable that the greatest part of the materials came from the west side of the Nile. The blocks of granite were of course brought from Syene, which is nearly 500 miles higher up the Nile. The rock on which the great pyramid stands has been found to project at least as high as 30 feet into the body of it. The stones of which it is built rarely exceed nine feet in length and six and a half in breadth; the thickness has been already stated.

The ascent of the great pyramid, though not without difficulty and danger, from the broken state of the steps, is frequently accomplished, and even by females. Belzoni describes the view from the top in terms of enthusiastic admiration.

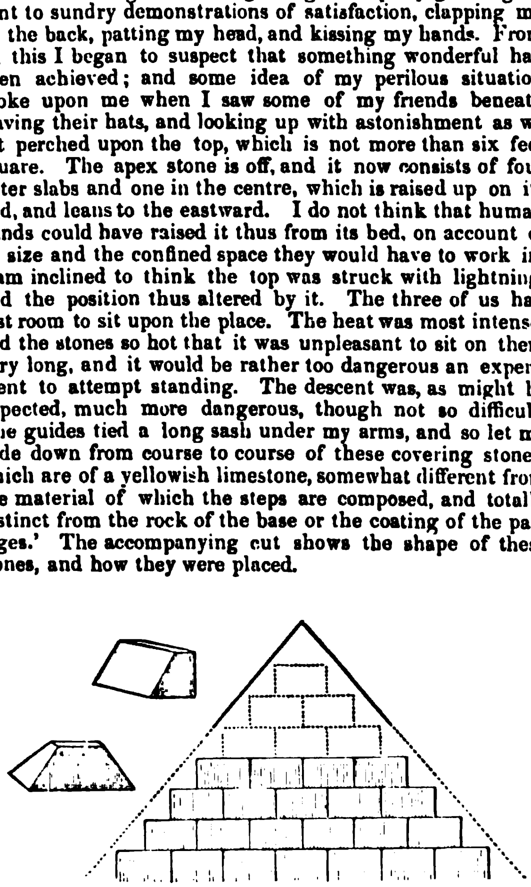
The pyramid of Cephren, the second in size, has the following dimensions, according to Belzoni:—

	Feet
Side of the base . . .	684
Vertical height . . .	456
Perpendicular bisecting the face of the pyramid	568
Coating from the top to the place where it ends	140

The angle which measures the inclination of each face to the base is 52° 2', and consequently this pyramid has a steeper ascent than the first. This second pyramid does not rise from the natural level of the plateau, but out of an excavation or deep cut made in the solid rock all round the pyramid. The rock in which this excavation has been made is higher than that on which the great pyramid stands, so that both pyramids may stand on the same level, but this does not seem to have been accurately ascertained.

Belzoni, after great exertion, succeeded in opening the second pyramid, and after traversing passages similar to those in the great pyramid, reached the main chamber, which is cut out of the solid rock. It is 46 feet 3 inches long, 16 feet 3 inches wide, and 23 feet 6 inches high. The covering is made of blocks of limestone, which meet in an angular point, and form a roof of the same slope as the pyramid. The chamber contained a sarcophagus, formed of the finest granite, which is 8 feet long, 3 feet 6 inches wide, and 2 feet 3 inches deep in the inside. There were no hieroglyphics on it. Some bones were found in it, which were ascertained to be those of an ox. From an Arabic inscription on the wall of the chamber, it appears that some of the Arab rulers of Egypt had entered this pyramid and closed it again. Belzoni also discovered another chamber in this pyramid.

The ascent of the upper part of the second pyramid is extremely difficult and dangerous. Mr. Wilde, who published, in January, 1840, a 'Narrative of a Voyage to Madeira, Teneriffe, and along the shores of the Mediterranean,' made the ascent; and as his account of the enterprise illustrates the subject of the casing, and is also interesting in itself, we give an extract from it, omitting such sentences or parts of sentences as are foreign to our purpose. 'I engaged two Arabs to conduct me to the summit of the pyramid, one an old man, the other about forty, both of a mould which for combination of strength and agility I never saw surpassed. We soon turned to the north, and finally reached the outer casing on the west side. All this was very laborious, to be sure, though not very dangerous; but here was an obstacle that I knew not how themselves could surmount, much less how I could possibly master; for above our heads jutted out like an eave or coping the lower stones of the coating, which still remain, and retain a smooth polished surface. As considerable precaution was necessary, the men made me take off my hat, coat, and shoes at this place; the younger then placed his raised and extended hands against the projecting edge of the lower stone, which reached to above his chin; and the elder, taking me up in his arms as I would a child, placed my feet on the other's shoulders, and my body flat on the smooth surface of the stone. In this position we formed an angle with each other, and here I remained for upwards of two minutes, till the older man went round, and by some other means contrived to get over the projection, when, creeping along the line of junction of the casing, he took my hands, drew me up to where he was above me, and then letting down his girdle, assisted to mount up the younger but less active and less daring climber of the two. We then proceeded much as follows:—One of them got on the shoulders of the other, and so gained the joining of the stone above, which was often five feet asunder; the upper man then helped me in a similar action, while the lower pushed me up by the feet. Having gained this row, we had often to creep for some way along the joining to where another opportunity of ascending was afforded. In this way we proceeded to the summit, and some idea may be formed of my feelings when it is recollected that all these stones of such a span are highly polished, are set at an angle less [more?] than 45°, and that the places we had to grip with our hands and feet were often not two inches wide, and their height above the ground upwards of four hundred feet. A single slip of the foot, and we must all three have been dashed to atoms long before we reached the ground. On gaining the top my guides gave vent to sundry demonstrations of satisfaction, clapping me on the back, patting my head, and kissing my hands. From all this I began to suspect that something wonderful had been achieved; and some idea of my perilous situation broke upon me when I saw some of my friends beneath waving their hats, and looking up with astonishment as we sat perched upon the top, which is not more than six feet square. The apex stone is off, and it now consists of four outer slabs and one in the centre, which is raised up on its end, and leans to the eastward. I do not think that human hands could have raised it thus from its bed, on account of its size and the confined space they would have to work in. I am inclined to think the top was struck with lightning, and the position thus altered by it. The three of us had just room to sit upon the place. The heat was most intense, and the stones so hot that it was unpleasant to sit on them very long, and it would be rather too dangerous an experiment to attempt standing. The descent was, as might be expected, much more dangerous, though not so difficult. The guides tied a long sash under my arms, and so let me slide down from course to course of these covering stones, which are of a yellowish limestone, somewhat different from the material of which the steps are composed, and totally distinct from the rock of the base or the coating of the passages.' The accompanying cut shows the shape of these stones, and how they were placed.



The upper part of the above design shows the coating, and the lower the steps: the upper left-hand figure gives the shape of the casing-stones, and the lower, that of those used at the corners.

The pyramid of Mycerinus, the third of the Jizeh group, is about 174 feet high; the side of the base is 330 feet, and the angle made by the plane of the face with the plane of the base is about 45°. Belzoni says that he found on the north side a considerable number of blocks of granite, which had evidently formed the coating: 'Proceeding yet lower as I cleared away the rubbish, I found that part of the coating still remained in its place down to the base.' This pyramid has not been opened.

The side of the base of the fourth pyramid is probably not more than 130 feet. Two pyramids to the west of the fourth consist each of four receding platforms, similar to the Mexican pyramids, and each of these platforms is ascended by high narrow steps, in which also they resemble the Mexican pyramids. The summit is a platform. Of the three pyramids which appear in the plan on the east side of the great pyramid, the middle one appears to be the pyramid which, as Herodotus tells us, was built by the daughter of Cheops.

There are some large pyramids at Sakkârah. One of them is next in dimensions to the pyramid of Cheops. Each side of the base is about 656 feet, and the height is 339 feet. It is built in receding platforms, and the interior is described by Wilkinson as a sort of hollow dome supported here and there by wooden rafters. At the end of the passage opposite to this dome is a small chamber, on the doorway of which there are some hieroglyphics, but this chamber and passage appear to be of a later date than the rest of the pyramid.

At Dashour there are also some large pyramids. One of them has a base, each side of which is 700 feet, a perpendicular height of 343 feet, and 154 steps. It has a little of the coating remaining on the top. The entrance is on the north face, and there is a principal chamber and some smaller chambers and passages similar to those which we have described in the great pyramid. In another pyramid, almost as large as the preceding, at the height of 184 feet, the plane of the side is changed, and a new plane of less inclination completes the pyramid; for which diminution of the angle there seems to be a sufficient reason, since the lower part of the side appears to make an angle of 70° with the base. This pyramid has been entered, and found to contain chambers and passages similar to the others. Near the first of these pyramids is one built of bricks. The base is a rectangle of 100 paces on one side and 75 on the other. The bricks are made of loam and chopped straw, and are sun-dried.

At Thebes there are some small pyramids of sun-dried brick, in which the central chambers have vaulted roofs. Judging from the style of the frescoes, Wilkinson infers that they date at least as far back as 1230 B.C., and from other buildings he concludes that brick vaults and arches were constructed by the Egyptians as early as 1540 B.C.

Herodotus informs us that in the lake Mœris, 'about the middle of it, there are two pyramids, each rising 300 feet above the water. The part that is under the water is just the same height. On the top of each is a colossus of stone, seated in a chair.' It is probable that these pyramids were built on an island in the lake, and that he was misinformed as to the depth under the water.

There are numerous pyramids in Nubia, perhaps eighty or more, but they are generally small. Many of them have propyla attached to one side, as if forming the entrance to the building. There are three groups of such pyramids at a place called Assur, near the Nile (about 17° N. lat.). They are built of sandstone, and the propyla are adorned with sculptures after the Egyptian fashion. They do not appear to have been entered. The sides of most, perhaps all, of the Nubian pyramids do not face the cardinal points. There is a group of pyramids at a place called Nourri, in lat. 18°25' N., a few miles north of Jebel Barkal, on the opposite (the east) side of the river. The largest of these pyramids contains within it another of a different date, stone, and architecture. The inner pyramid is seen in consequence of part of the outer one having fallen off. The base line is about 153 feet, and the height about 104 feet.

But buildings of this description are not confined to Egypt and Nubia. The temple of Belus (the Birs Nemroud), and the Mujelibè, at Babylon, were pyramidal buildings. The perimeter of the base of the Birs Nemroud is 762 yards. The Mujelibè has an oblong base, the sides of which face the cardinal points. The northern side is 200 yards, the southern 219, the eastern 182, and the western 186. The highest part of it which remains is 140 feet. There are passages in it, and a hollow shaft 60 feet square. Coffins and skeletons have been discovered in it. [BABYLON.]

Xenophon, in his account of the retreat of the ten thousand, speaks of a stone pyramid which he saw near the Tigris, about forty-five miles south of the present Mosul, the height of which he estimated at 200 feet. There are some temples of the pyramidal form near Benares, in the East Indies. But next to those of Egypt the most extraordinary pyramids now existing are those of Mexico. At Teotihuacan, eight leagues north-east of the city of Mexico, there are two large pyramids, surrounded by several hundred small ones placed in lines running due north and south, and east and west. The two large pyramids are formed of clay mixed with small stones, but they were cased with a sort of porous amygdaloid. They consist of four receding platforms, each of which is formed into a number of small steps, the edges of which were visible when Humboldt visited them. A colossal stone statue, covered with plates of gold, stood on the summit of each, but the soldiers of Cortez carried off the gold, and the statues were broken. The largest of the small pyramids is not above thirty feet high. The great pyramid of Cholula in Mexico has a base each side of which is 1440 feet, and the area of the base is therefore upwards of forty-seven acres and a half, more than three times the base of the great pyramid of Jizeh, but the present height is much less, being only 177 feet. The platform on the top has an area of more than 40,000 square feet, and a church has been built in the centre of it. This pyramid is built of alternate layers of clay and sun-dried bricks. [CHOLULA.] A small pyramid, built entirely of well-hewn stones of a remarkable size, has been discovered, which had escaped the notice of the early Spaniards. It is 59 feet high, and each side of the base is 82 feet. The casing of the platforms is adorned with hieroglyphic sculptures. It is to the east of the pyramid of Teotihuacan. Several other pyramidal buildings were discovered in Mexico by Captain Dupaix, between 1805 and 1808, in three successive expeditions which were prosecuted under the authority of the Mexican government. The Mexican pyramids, like those of Egypt, and the Babylonian and the Indian, have the four sides facing the four cardinal points; but this rule has not been observed in building the Nubian pyramids.

The East Indian, the Babylonian, and the Mexican pyramids appear to have been partly religious and partly sepulchral; but there is no trace of evidence to show that the Egyptian pyramids were built for any purpose but that of preserving the bodies and perpetuating the names of those who built them. Most of them were cased in such a manner as to render the ascent difficult and dangerous, if not impossible. The passages to the sepulchral chambers, and indeed to all the chambers, were carefully closed and concealed, and nothing has been found in any of them but coffins and their mouldering contents. As to their having been built for astronomical purposes, about which there has been much discussion, in addition to there being nothing to prove that they ever were used for such purposes, it may be asked, why build two of such enormous size so close together, when one would have answered the purpose, and why build so many of all sizes?

The preceding account has been abridged from the chapter on the pyramids in the 'Egyptian Antiquities,' vol. ii., in the 'Library of Entertaining Knowledge,' with some trifling alterations and additions. See also Savary's 'Letters on Egypt,' Lond. 1799; 'Description de l'Egypte,' vol. v., Paris, 1829; Wilkinson's 'Topography of Thebes and General View of Egypt,' London, 1835; Wilde's 'Narrative,' Dublin, 1840.

PYRARGILLITE occurs in four-sided prisms, with bevelled edges and massive; frequently traversed by chlorite. Colour black or blue; in the former case shining, in the latter dull. Emits an argillaceous odour when heated. Dissolves entirely in nitric acid.

It is found in granite near Helsingfors in Finland.

Analysis by Nordenskiöld:—Silica, 43·93; alumina, 28·93; oxide of iron, 5·30; magnesia, 2·90; potash, 1·05; soda, 1·85; water, 15·47.

PYREICUS, a Grecian painter of uncertain age and country, but he most probably lived shortly after the time of Alexander. He was the head of the antient *genre* painters (peintres du genre bas), or of those who practised in the lower classes of art, formerly so prevalent in the Netherlands, and which the Greeks termed Rhyparography (ῥυπαρογραφία). According to Pliny (xxxv. 10. 37), Pyreicus stood without a rival in this line of art, and though in an humble style, he attained the greatest fame. He painted barbers' shops and cobblers' stalls, shell-fish and eatables of all sorts, and the like: on this account he was called by the Greeks Rhyparographos, that is, literally, 'dirt-painter.'

PYRENEES, a range of mountains extending from the Mediterranean Sea to the Bay of Biscay, and constituting a natural barrier between France and Spain. They were well known to the antients, especially to the Romans, within the boundary of whose empire they were comprehended. The etymology of the name is uncertain: it is written by Strabo usually in the singular, Πυρήνη (ὄρος);* by Cæsar it is written in the plural form, Pyrenæi Montes; by Pliny indifferently in the singular or plural; and Lucan has given it (*Pharsalia*, i. 689) in the Greek form Pyrênê. Historically these mountains are associated with the celebrated march of Hannibal and the warfare of Cæsar against the Pompeians in Spain. In a later period they formed the limit of the Frankish conquests under Clovis, but were passed by the ambition and power of Charlemagne, who however lost his rear-guard among their defiles. In the middle ages they were crossed by the French in their successive wars in Spain; and by Edward the Black Prince in his expedition to support Peter the Cruel; and in modern times they were the scene of severe conflict in the Spanish wars of Napoleon, especially when the French were driven out of the Peninsula by the Duke of Wellington, in the winter campaign of 1813-1814.

The Pyrenees are usually considered as occupying the limits which we have assigned, and as constituting an insulated chain; but this is hardly correct. On the east, their ramifications are connected with those of the Cévennes [CEVENNES]; and on the west, the prolongation of the Pyrenees forms the mountains of Guipuzcoa, Biscay, Asturias, and Galicia, the loftiest summits of which all but equal in height those of the Pyrenees proper, and the extremities of which terminate in the capes Ortegal and Finisterre, and the other headlands of the north-west of Spain. Our present article will however comprehend a notice of that part only of the system to which the name of Pyrenees is usually applied.

The area occupied by these mountains is comprehended between 42° 10′ and 43° 20′ N. lat., and between 3° 20′ E. and 2° 0′ W. long. The length of the chain from Cape Creux, or Creuz, near the town of Rosas, or Roses, in Catalonia, on the coast of the Mediterranean, to the port of Passages in Guipuzcoa, is about 270 miles in a straight line from east by south to west by north. The breadth varies: it is greater near the central part of the chain than toward the extremities. Between Tarbes and Jaca, and again between Pamiers and Urgel, the breadth may be stated in round numbers at 60 miles; between La Bastide de Clarence, near Bayonne, and Pampeluna, near the western extremity, it may be estimated at 40 to 45 miles; and between Collioure and Figueras, near the eastern extremity, it is diminished to about 20 miles.

The Pyrenees pass along the border of the following districts of France, enumerated for the most part in their order from east to west:—Le Valespir, Le Conflent, La Cerdagne Française (to the north of which are Le Capsir and Le Donezan), and the valley of Carrol, all in the province of Roussillon, which now forms the department of Pyrénées Orientales; the county of Foix and the district of Couserans, the latter in the province of Languedoc, and both now in the department of Arriége; Le Haut Comminge (including the district properly so called, and the valleys of Beimale, Biros or Birosse, Luchon, Larboust or L'Arboüste, Oail, and Louron), now divided among the three departments of Arriége, Haute Garonne, and Hautes Pyrénées; Les Quatre Vallées, or the four valleys of Barousse, Aure, Neste, and Magnoac, forming part of the county of Armagnac in Gascogne; and the valleys of Campan, Barèges, Lavedan, and Azun, in the county of Bigorre, all now included in the department of Hautes Pyrénées: the valleys of Asson, or Ossau, Aspe, and Barreton, in Béarn; the Pays des Basques (including the Pays de Soule, Basse Navarre, and the Pays de Labour), all in Gascogne, and all now included in the department of Basses Pyrénées.

In Spain the Pyrenees pass through Catalonia, in which are included Spanish Cerdagne, and the valleys of Andorre, Pailiass or Paillas, and Arran, with a number of smaller valleys; Aragon, including the valleys of Venasque, Gistain or Justau, Bielsa, Broto, Canfran, Echo, and others; and Navarre, including the valleys of Roncal, Abescoa, Roncevaux, or, as the Spaniards write it, Roncesvalles (where Charlemagne's rear-guard was cut off by a combination of enemies), Erro, Henqui, Lanz, Bastan, and Lerin. Andorre, a valley locally in Catalonia, has existed for a thousand years, almost unnoticed, as an independent republic. [ANDORRE.]

The range of the Pyrenees may be regarded as consisting of two parts, both having the same general direction, but not forming one continuous line: the point of dislocation is near the head of the Garonne; from thence to the Mediterranean the principal ridge is more advanced toward the north than between the head of the Garonne and the Bay of Biscay. The point at which the two parts of the chain approach each other is occupied by a group of mountains which unite them to one another. The Spanish or southern slope of the Pyrenees is generally considered to be steeper than the northern or French side: the ascents on the Spanish side are invariably more rugged and difficult; and while on the south side of Mount Perdu and other lofty

* The word Πυρήνη occurs in Herodotus, ii. 33, but it is there given as a [illegible]

mountains the summits rapidly diminish in height, there are several peaks on the north side which scarcely yield to Mount Perdu itself in elevation. The French valleys generally ascend toward the main ridge by a succession of steps and terraces.

From each side of the principal range a number of smaller branches are thrown off, forming, as it were, buttresses to the principal range, and enclosing valleys between them. These lateral branches are thrown off at the points where the main ridge rises into lofty summits; while the heads of the valleys are marked by depressions, which constitute the natural passes between one side and the other of the mountains. Towards the extremities of the Pyrenees, especially towards the eastern extremity, these depressions are called 'cols' (*i.e.* necks), as in the Alps: in the central part, and, in some cases, toward the western extremity, they are more commonly designated 'ports.' Other terms of similar meaning are also used occasionally. The principal branches thrown off on the northern side are the Corbières, near the eastern end of the range, which connect the Pyrenees with the Cevennes; and a range, without name, which separates the basins of the Adour and the Garonne.

All the great valleys of the Pyrenees are transverse. The head of the valley is usually at a 'col' or a 'port,' and the valley extends twenty, thirty, or even forty miles toward the north or south, bounded by the lateral branches of the mountains. The longest valleys, as that of the Garonne, and the valley of Lavedan, which is watered by the Gave de Pau, are near the centre of the great range. There are some valleys which have their direction parallel to the principal range: and though not equal in extent to the transverse valleys, yet some of them are near twenty miles in length. Sometimes the mouth, or opening of the valley into the plain, is open or broad; in other cases the valleys have narrow entrances. Many of them in their course present a succession of basins, or circular hollows, called by the mountaineers 'oules,' *i.e.* pots or boilers,* through which the stream which waters the valley winds slowly, assuming a character in keeping with the quiet scenery of these secluded spots. These basins are usually elevated one above the other, and they communicate by narrow and deep ravines, or by a slope or descent more or less steep. In the upper part of the valleys, where these basins are more frequent and more perfect in their form, they often contain lakes. These lakes are numerous on the French or northern side of the mountains; on the Spanish or southern side they are seldom seen. Some of them are in very elevated sites. Malte-Brun (*Géographie Universelle*) enumerates eight which are at an elevation of above 2000 metres (= 6557 English feet). When they are of such elevation as to be surrounded with glaciers, they are commonly frozen. The lake at the 'port' of Oo (elevation 8800 feet) is covered with ice all the year round; the lake of Mont Perdu (elevation 8393 feet), and the lakes of Estom Soubiran, in the valley of Cauteretz, are covered with ice until the end of August. The most elevated lake given by Malte-Brun is that of the Pic-du-Midi (8813 feet).

The basins described above seldom if ever exceed eight miles in length by three or four in breadth. They are always at the point of junction of several valleys or gorges, and their extent bears a proportion to the number of valleys or gorges which open into them. They are found also in the elbows formed by the alteration in the direction of a valley. Their soil is alluvial, and often marshy or composed of peat. The manner in which the streams that water them break away through deep and narrow gorges is a proof that they have been antiently the beds of lakes, the water of which has been drained off by bursting through the rocky barrier by which they were surrounded.

The sides of the mountains which skirt the valleys seldom rise with an unbroken slope to their summit, but consist of a succession of slopes of varying inclination, with small plains or terraces intervening. Those terraces or plains in the mountains which rise on one side of a valley usually correspond in elevation and in the strata which compose them to those of the mountains on the other side. This arrangement is observable in the upper districts of the valleys; in the lower districts, where the mountains are of inferior height, they frequently consist of an unbroken slope from their base to their summit. At the head of some of the valleys is found one of the hollows or basins, locally termed 'oules,' surrounded by walls of almost perpendicular rock called 'cirques,' and sometimes 'amphitheatres.'

The line of perpetual congelation in the Pyrenees appears not to have been ascertained. Ramond fixed it at from 13 to 1400 toises (8600 to 9000 feet English measure); but on some mountains, as on the Pic-du-Midi of Bigorre, which exceeds this limit (9544 feet), the snow melts in August. Malte-Brun gives the line of perpetual congelation at 2[illegible] mètres (=9266 feet) on the northern slopes, and 25[illegible] mètres (=8308 feet) on the southern. The climate in the neighbourhood of the Pyrenees varies considerably. It is warmer at the extremities, because of the inferior height of the mountains and the proximity of the sea, this is especially the case at the eastern extremity, where the olive grows luxuriantly. The winters are short, and in the lower valleys snow rarely lies more than a day or two. In the upper valleys the climate is more rigorous. The pine and the fir, the box, the rhododendron, the Alpine rose, and a variety of other trees and shrubs, grow on the sides. The summers are very warm, and vegetation in all the valleys is very luxuriant. Thunder-storms are frequent, and are accompanied by rains, which cool the air greatly.

Numerous streams rise both on the northern and the southern side of the Pyrenees. Those on the southern side, except a few near the eastern extremity, flow into the Ebro. The Arga, which passes Pampeluna, the Iratie, the Esca, and several others are received by the Aragon, which rises near the Pic-du-Midi, and flows westward into the Ebro at Alfaro, between Calahorra and Tudela. The Gallego, or Gaillego, receives a number of mountain streams, and joins the Ebro below Saragossa. The Cinca and the Segre, which unite and flow into the Ebro near Mequinenza, receive all the drainage of the southern slope from the neighbourhood of Barèges to that of Mont Louis; several of the tributaries of these rivers, as the Ara, the Essera, the Noguera or Nogurra, the Ribagorsana, and the Noguera Pailleressa, are considerable streams. The Cardonner, the Fluvia, the Ter, and some others near the eastern extremity flow immediately into the Mediterranean.

The waters of the northern slope near the western extremity chiefly flow into the Adour. The Bidassoa indeed flows directly into the Bay of Biscay, but it is an inconsiderable stream, and would be of no importance but from the accidental circumstance of its forming the boundary between France and Spain. The Adour itself rises in the valley of Campan above Bagnères de Bigorre, and all the streams to the westward, as far as the Nive and the Hous[illegible] peleco, which rise in the neighbourhood of St. Jean-Pied de Port, fall into it. Eastward, from the source of the Adour to the source of the Arriège in the valley of Carrol, near the town of Ax, the waters all fall into the Garonne. The Garonne itself rises at the head of the valley of Arran, just at the point where the two portions of the principal range of mountains approach each other. Mont Maladetta, Maudit (Maledictus, 'accursed'), is on the south side of this valley. The Spanish river the Noguera Pailleressa rises very near to the source of the Garonne, and flows in an opposite direction. The streams eastward of the Arriège fall into the Aude, which waters Carcassonne, except the Tech, the Tet, and the Gly, which fall immediately into the Mediterranean.

There are numerous mineral springs in the neighbourhood of the Pyrenees; several of those on the French side are of considerable repute. Those of Bagnères de Bigorre, Bagnères de Luchon, and Barrèges, are noticed elsewhere. [BAGNERES DE BIGORRE; BAGNERES DE LUCHON; BARREGE.] Those of St. Sauveur, in the valley of Lavedan; of Cauterets or Cauteretz; of Eaux Bonnes, in the valley of Ossau; of Eaux Chaudes, in an adjacent valley; of Ax, in the valley of the Arriège; of Aleth, in that of the Aude; and some others, are also of considerable note.

In the higher Pyrenees glaciers are of frequent occurrence; they are found adjacent to the loftiest peaks. Avalanches also occur, as in the Alps. The glaciers of the Pyrenees are found on the slopes of the loftier mountains, not occupying deep gorges or valleys, as in the Alps; neither are they, as in the latter mountains, contiguous, but separated frequently by considerable intervals. They are frequently traversed by deep fractures or chasms. Glaciers are found only in one part of the mountains between the valleys of Arran and Ossau, and for the most part on the northern slope of the mountains. The principal are the

* The word 'oule' (*houle* or *eoil*) means a large pot or kettle, and appears to contain the same element as the Latin 'olla.'

of Maladetta, Crabioules, Mont Perdu, Brèche de Roland, Viguemale, and Neouvielle, which take their names from the peaks or depressions adjacent.

The recesses of the Pyrenees are the haunts of the izard, a variety of the chamois, of smaller size and brighter colour, possessing, it is probable, less strength and agility than the chamois of the Alps. The bear and the wolf are also found, but the bear is not so ferocious as that of Switzerland. The slopes of the mountains afford pasturage in summer to numerous flocks, which are driven thither from the plains or lower slopes where they pass the winter. Iron, copper, and lead and silver mines are wrought, and fine statuary and other marble, including some of the most beautiful varieties, is quarried. The shepherds and other mountaineers are a fine intelligent race of men, especially those on the southern or Spanish side, and, on the north side, the Basques, who inhabit the western part of the chain. An unhappy and despised race of men, disfigured, like the mountaineers of Valais in the Alps, by wens or goîtres, are found in the Pyrenees, where they are called Cagots. They were formerly held in abhorrence, and retained in a state of the utmost degradation and misery. With the general advance of comfort and civilization, and the prevalence of a better spirit, these deformities are becoming less frequent.

We subjoin a table of the elevation of the principal summits and depressions (cols, or ports) of the Pyrenees, and of some of the towns or other inhabited places near or amidst them:—

Summits.

(We have given only those which exceed 9000 feet.)

	Summit.	Department or Province.		Feet.
	Le Canigou	Aude		9,132
	Pic Peyrie, or Prigue	Arriège and Pyrénées Orientales		9,037
*	Pic Lanoux	Pyrénées Orientales		9,284
*	Pic Pedrous	Ditto		9,433
*	Pic de Fontargente, or Fonte Argente	Arriège		9,164
*	Pic de la Serrère	Ditto		9,592
*	Pic du Port de Seguier, or Siguier	Ditto		9,525
*	Montcalm	Ditto		10,513
*	Estats	Ditto	C. A.	10,611
*	Montvallier	Ditto		9,120
*	Pic de Montoulêon, or Tuc de Mauberme	Ditto		9,424
	Montarto, or Pic de Rious	Valley of Arran in Catalonia		9,557
*	Crabioules, or Carabioules	Haute Garonne		10,450
*	Tuque de Maoupas	Ditto		10,228
	Pic Fourcanade	Valley of Arran in Catalonia	C. A.	10,030
	Pic de Néthou, or Nétou, or Anethou, the highest summit of Mount Maladetta and of the whole range of the Pyrenees	Ditto		11,318
	Inaccessible ridge to the west of the Pic de Néthou	Ditto		10,304
*	Pic Poset, or Las Posets, otherwise La Punta de Lardana	Aragon		11,172
	Pic Quairat	Haute Garonne		10,038
	Pic de Montarouye	Ditto		9,107
	Pic des Hermittans	Ditto		9,842
*	Pic de Batoa, or Biedous	Hautes Pyrénées		9,918
	Pic d'Arré, upper	Ditto		9,525
	Ditto, lower	Ditto		9,405
*	Pic de Baroudes	Ditto		9,703
	Mont Perdu	Aragon		11,264
	Cylindre du Marboré	Ditto		10,950
*	Pic de la Cascade	Hautes Pyrénées		10,646
*	Tour du Marboré	Ditto		9,933
	Summit of Le Pimené	Ditto	M. B.	9,380
*	Le Taillon	Ditto		10,443
*	Troumouse	Ditto		10,399
	Pic d'Aiguillon	Ditto		9,646
	Commencement of the cascade of Gavarnie	Ditto		10,385
	Pic de Campbiel, or Cambielle	Hautes Pyrénées		10,513
	Pic Long	Ditto		10,488
	Pic de Neouvielle	Ditto		10,235
	Pic d'Arbizon	Ditto		9,247
	Pic-du-Midi de Bigorre	Ditto		9,432
*	Viguemale	Ditto		10,900
	Pic de Badescure	Ditto		10,228
*	Pic d'Arrieu Grand	Ditto		9,760
*	Pic or Som de Soube	Basses Pyrénées		10,178
*	Pic-du-Midi d'Ossau	Ditto		9,696
	Pic d'Aule	Ditto		9,532

Depressions.

	Summit.	Department or Province.		Feet.
	Col de Puymoreins	Arriège	M. B.	6,295
*	Port de Rat	Ditto		7,403
	Port de Lherz, or Lers	Ditto		4,927
	Col de la Couillade	Ditto		6,434
	Port de Viella	Valley of Arran in Catalonia		8,145
*	Portillon de Burbe	Haute Garonne		4,079
	Port de la Picade	Aragon		7,872
*	Port de Venasque	Haute Garonne		7,841
*	Port de la Glère, or de la Claire	Ditto		7,529
*	Port d'Oo	Ditto		9,753
	Port de Peyresourde	Ditto		4,991
*	Port de Clarabide	Hautes Pyrénées	C. A.	9,849
*	Port de Lapez	Ditto		8,008
*	Port de Plan	Ditto		7,289
*	Port Viel or Vieux	Ditto		8,322
*	Port de Pinède, or Estaubé	Ditto		8,176
*	Brèche de Tuque Rouye	Ditto		9,417
	Col de Pimené, or Brèche d'Allans	Ditto		8,176
*	Brèche de Roland	Ditto		9,766
*	Port de Gavarnie	Ditto		7,423
	Port de Campbiel, or Cambielle	Ditto		8,442
	Col de Tourmalet	Ditto		7,131
	Col de Lavasse, or L'Avase	Ditto	M. B.	5,836
	Col de Loubie	Ditto	M. B.	5,672
	Port de Canfranc, or St. Christine	Aragon		6,713
*	Port de Roncevaux	Navarre	C. A.	5,771
*	Port de Arräiz	Ditto	C. A.	4,347

The summits and depressions marked thus * are on the ridge along which runs the boundary of France and Spain. Pic means peak or summit; tuc or tuque, in the patois of the district of Couserans, has the same meaning. Col, port, portillon, and brèche all mean a depression at the head of a valley These cols or ports form the passages by which the peasantry pass from one valley to another. They are frequented by contrebandiers, or smugglers, a bold and hardy race of men, chiefly Spaniards, remarkable for the coolness which they exhibit in the critical circumstances to which their mode of life frequently exposes them. The most important of these passes are the Col de Pertus commanded by the fortress of Bellegarde, through which runs the road from Perpignan to Barcelona, practicable at all seasons, and for vehicles of every kind; the Col de la Perche, commanded by the fortress of Mont Louis, communicating between French and Spanish Cerdagne; the Port de Salo, through which runs the road from Toulouse and St. Girons to Lerida; the Port de Viella, by which communication is kept up between the valley of Arran and the rest of Spain; the Port de Canfranc, through which runs the road from Oléron by the valley of Aspe to Jaca; the Port of Orisson and the Port of Roncevaux, through which runs the road from St. Jean-Pied-de-Port to Monreal; and the Port de Maya, communicating between Bayonne and Pampeluna. Several of these are not given in our list. The main road from Paris. Bordeaux, and Bayonne to Madrid is near the sea, at the western extremity of the chain.

The chief authority for the above tables is Mr. Erskine Murray. A few are taken from Malte-Brun (M.B.), and the 'Companion to the Almanack (C.A.) for 1833.' The elevations in the latter are taken from Reboul and Vidal, Charpentier, Bory de St. Vincent, and others. The heights in Malte-Brun are given in mètres, here reduced to English measure, at the rate of 1 mètre = 3·279 feet, or 1 foot = ·305 mètre. Mr. Murray's table we have ascertained to be reduced from that of Charpentier at the rate of 6 feet 4 inches to the toise.

Our chief authority for this sketch of the Pyrenees has been the account of that mountain-range translated from Charpentier's *Essai sur la Constitution Géognostique des Pyrénées*, and subjoined to the Hon. James Erskine Murray's *Summer in the Pyrenees*, 2 vols. 8vo., 2nd edit., London, 1837; compared with Malte-Brun, Balbi, and the *Dictionnaire Géographique Universel*, Paris, 1831.

PYRE'NE'ES, BASSES, a department in the south of France, bounded on the north by the department of Landes, on the north-east by that of Gers, on the east by that of Hautes Pyrénées, on the south and south-west by the provinces of Navarre and Guipuzcoa in Spain (from which it is separated by the Pyrenees), and on the north-west by the Bay of Biscay. Its form is tolerably compact: the greatest length is from east to west, from the village of Montaner near Vic Bigorre (in Hautes Pyrénées) to the mouth of the Bidassoa (which separates France and Spain), 88 miles: the greatest breadth is from north to south, near the eastern side of the department, from near the town of Garlin to the crests of the Pyrenees, near the source of the Gave d'Azun, which flows into the Gave de Pau, about 54 miles. The area is estimated at 2901 square miles, being considerably above the average area of the French departments, and about equal to the conjoint areas of the three English counties of Gloucester, Worcester, and Warwick. The population in 1831 was 428,401; in 1836 it was 446,398: showing an increase in five years of 17,997, or more than 4 per cent., and giving 154 inhabitants to a square mile. In amount of population it is considerably above the average of the French departments; but in density of population it is somewhat below the average; and is, in both respects, surpassed by the united English counties with which we have compared it, in the proportion of two to one. Pau, the chief town, is on the right bank of the Gave de Pau, about 402 miles in a straight line south-south-west from Paris, or 497 miles by the road through Orléans, Vierzon, Châteauroux, Limoges, Périgueux, Bordeaux, Langon, Bazas, Roquefort, and Aire; in 43° 17′ N. lat. and 0° 23 E. longitude. [PAU.]

The southern border of the department is formed by the Pyrenees. The lateral branches of these mountains run from south to north, gradually subsiding into the plain which is watered by the Adour and its tributaries. The elevation of this part, the western extremity, of the Pyrenean range, is, as the name of the department indicates, lower than the central parts. Scarcely any of the summits exceed 9000 feet: we are not aware of more than three; the Som de Soube, on the principal ridge, between the valleys of Azun and Ossau; the Pic-du-Midi of Ossau or Ossan, at the source of the Gave d'Ossau, both in the south eastern corner of the department; and the Pic d'Aule, in the same neighbourhood. [PYRENEES.] The Pic d'Anie, on the principal ridge of the Pyrenees, between the sources of the Gave d'Aspe and the Seison or Soisson, has an elevation of 8398 feet: the mountain of Orhi or Hory, on the same ridge farther westward, has an elevation of about 6530 feet: Mendibelsa, in the canton of St. Jean-Pied-de-Port, has an elevation of 3734 feet: Ahady, at the source of the Nive, of 4790 feet; and Hausa, between the valley of Baigorry in the south-western part of the department, and the valley of Bastan in Spain, of 4224 feet. The chief passages across this mountain-frontier are the main road from Paris by Bordeaux and Bayonne to Madrid, which crosses the boundary at the western foot of the mountains near the sea; the Port de Maya, between Bayonne and Pampeluna, capital of Navarre; the Port de Roncevaux, or Roncesvalles, between St. Jean-Pied-de-Port and Monreal and Pampeluna; and the Port de Canfranc, between Oléron and Jaca. [PYRENEES.]

The Pyrenees consist of primitive rocks (especially granite mingled with gneiss), which occupy however but a small space in this department. The transition rocks (grauwacké, grauwacké slate, clay-slate, and transition limestone) form the principal component part of the mountains, skirting the nucleus of primitive rocks by which they are supported. The secondary formations, especially the new red-sandstone or red-marl formation, and the Alpine limestone which overlies it, form the predominant rocks; the former is observed in the higher part of the mountains, where it usually exceeds the transition rocks in elevation; the latter appears in the lower slopes and at the base of the mountains, extending northward in several parts to the banks of the Adour and the Gave de Pau. The immediate vicinity of these rivers, and the north-eastern part of the department, which extends across the Gave de Pau, are occupied by the tertiary formations. Masses of secondary trap rocks are found in the lower part of the valleys of Baigorry, Cize, and Laurhibare, watered by the branches of the Nive; in that of Soule; in those of Baretons, Aspe, and Ossau, watered by the tributaries of the Gave d'Oleron; and in the valley of Asson, watered by a feeder of the Gave de Pau. The formations of the cretaceous group are found on the flanks of the Pyrenees, but so altered in their mineralogical character by their vicinity to the granite, that it requires a careful examination of their characteristic fossils to distinguish them, and most writers have omitted to notice their occurrence.

The mineral wealth of the department is not considerable. There were formerly celebrated copper-mines in the transition formations of the valley of Baigorry. It has been said that mines were worked in this valley by the Romans; at any rate they were successfully worked for a considerable time in the middle ages. After having been given up, the working of them was resumed about the middle of the last century; but after occasioning immense loss to the proprietors and to the companies which successively undertook to work them, they were again abandoned. Iron-ore is obtained in the same valley. There were in the department, in 1834, six establishments for the manufacture of iron, comprehending three furnaces for making pig-iron, and eleven forges for the production of wrought-iron. The fuel employed in three establishments was charcoal alone; in the rest charcoal with other fuel. The mountains afford granite, freestone, and slate, in which some quarries are worked. There are several mineral springs.

The department belongs altogether to the basin of the Adour. The general slope of the soil is to the north-west. A number of rapid mountain-streams flow down from the Pyrenees and fall into the Adour, which has the lower part of its course on the border of the department. Of these streams the Lesset, the Larcis, the Lees, and the Gros Lees (which two unite their streams), the Gabas, the Louts, the Luy de France, and the Luy de Béarn (which two also unite), flow through the north-eastern part of the department into one or the other of the adjacent departments of Hautes Pyrénées, Gers, or Landes, and afterwards unite with the Adour. The Gave de Pau, which rises in the department of Hautes Pyrénées, and the Gave d'Oleron (which is formed by the junction of the Gave d'Ossau or Osson, and the Gave d'Aspe), flow through the centre of the department from south-east to north-west, uniting their waters in the adjacent department of Landes and falling into the Adour. The Gave de Pau receives the Baise and the Lussen on its left bank; the Gave d'Oleron receives the Saliès on the right, and the Vert and the Seison or Soisson on the left bank. The Bidouze, the Joyeuse, and the Nive flow into the Adour, having the whole of their course in the department or upon its border: the Bidouze receives the Hidoure on its left bank, and the Nive receives the Airi and the Heurespalare, also on its left bank. The Nivelle and the Bidassoa fall into the Bay of Biscay, but the latter only touches the border of the department (which it separates from Spain), and that but for a short distance.

The navigable rivers of the department are thus given in the 'Statistique de la France:'—Adour, 15 miles; Bidouze, 11 miles; Laran, 9 miles; Ardanabia, 8 miles; Nive, 12 miles; Nivelle, 6 miles; Bidassoa, 4 miles—total, 64 miles.

Two of the rivers mentioned in this return, the Laran and the Ardanabia, are not laid down in the maps, nor mentioned in the other authorities which we have consulted; unless, which is very likely, they are designated by some other name. There are no navigable canals in the department. There are some small lakes in the Pyrenees, in the south-eastern corner of the department, and some marshes in the neighbourhood of Pau and Lescar.

There are six *routes royales*, or government roads, having an aggregate length of 261 miles; of which (on January 1, 1837) 227 miles were in good repair, 15 miles out of repair, and 19 unfinished. The principal road is that from Paris to Madrid, which crosses the Adour and enters the department at Bayonne, and runs through St. Jean-de-Luz to the bank of the Bidassoa, opposite Irun, where it enters Spain. Roads run from Bayonne—one through the Port de Maya into Spain, and one by the valley of the Adour and the Gave de Pau to Orthès and Pau. The road from Paris to Pau branches off from the road from Paris to Bayonne at Roquefort, in the department of Landes, and enters the department near Garlin. The road from Paris to Orthès, St. Jean Pied-de-Port, and thence by the Port de Roncevaux, or Roncesvalles, into Spain, branches off from the road from Paris to Madrid, at Mont de Marsan, in the department of Landes, and enters this department at Sault de Navailles. Roads run from Pau, one to Tarbes (in the department of Hautes Pyrénées), and one to Oleron, and from thence by the Port de Canfranc to Jaca in Spain. The departmental roads have an aggregate length of 417 miles, of which (January 1, 1837) 263 were in good repair, 59 out of repair, and 95 unfinished. The aggregate length of the bye-roads and paths is above 5000 miles.

The climate is healthy and mild, and the soil in the lower grounds is tolerably productive. There is however much waste land. The area of the department may be estimated in round numbers at 2,000,000 of acres, of which nearly 400,000 acres (or about one-fifth) are under the plough. The principal grain crops are wheat, rye, barley, oats, millet, and maize: the produce in wheat is by no means equal to the consumption of the department; maize is much used as an article of food. Very fine flax is also grown. There are about 160,000 acres of grass-land, besides nearly 560,000 acres of heath or other open pasture-ground, a large portion of it on the slopes and in the valleys of the Pyrenees. The quantity of cattle is very great; also of pigs, from which the Bayonne hams are made. The breed of horses is considered good; and mules are bred for the Spanish market. The vineyards occupy nearly 60,000 acres; the red wines of Jurançon and Gan are in the highest repute of any grown in the department; the brandy of Hendaye, on the Bidassoa, is also esteemed. There are above 220,000 acres of wood-land; the forests are in a great degree composed of the fir, the pine, and the oak that produces the gall-nut; they supply excellent timber for house and ship building, and for the masts of vessels. About 16,000 acres are laid out in orchards and gardens. The mulberry is cultivated for the rearing of silkworms; the walnuts are excellent.

The department is divided into five arrondissements, as follows:—

Name.	Situation.	Area in sq. miles.	Communes.	Population in 1831.	1836.
Pau	N.E.	601	204	117,365	122,404
Oléron	S.E.	719	91	74,552	76,312
Orthès	N.	424	152	84,659	87,439
Bayonne	W.	413	23	78,411	84,319
Mauléon	S.	723	149	72,884	75,704
		2901	630	428,401	446,398

There are forty cantons or districts, each under the jurisdiction of a justice of the peace.

In the arrondissement of Pau are—Pau (pop. in 1831, 10,597 town, 11,285 whole commune; in 1836, 12,607 for commune) [PAU], Nay or Nai (pop. 3127 town, 3299 whole commune), and Lescar, all on the Gave de Pau; Gan (pop. 2027), on the Nées, a small stream which joins the Gave de Pau on the left bank below Pau; Morlaas, between the Luy de France and the Luy de Béarn; Garlin, near the Gros Lees; and Lembeye and Conchez, near the Lees. Nay is on the left bank of the Gave, and is a tolerably well built town; the inhabitants manufacture druggets, hosiery, blankets, and other woollens; and carry on trade in linens and in Béarnais handkerchiefs: there are two fairs in the year. Abbadie, a Protestant divine of some note, was born at Nay. The castle of Coarraze or Courase, where Henri IV. was brought up, is in the neighbourhood of this town. Lescar is on a hill; it was built in the tenth century, by Guillaume Sanche, duke of Gascogne, and suffered much in the civil wars of the sixteenth century. It was the seat of a bishopric previous to the Revolution, and had a college under the direction of the Barnabites. The present population may be estimated at about 2000. Gan is in the midst of vineyards, which produce good red wine and some white wine. There are some mineral springs near the town, of which no use is made. Morlaas was anciently the capital of Béarn, and had a mint. The townsmen, who amount to more than 1500, carry on some trade in wine.

In the arrondissement of Oléron are—Oléron (pop. in 1831, 5850 town, 6459 whole commune; in 1836, 6520 commune), and Sainte Marie (pop. in 1831, 2712 town, 2971 whole commune), adjacent to each other at the junction of the Gave d'Aspe and the Gave d'Ossau, whose united streams form the Gave d'Oléron [OLERON]; Laruns and Arudy (pop. 1534 town, 1863 whole commune), on the Gave d'Ossau or Osson; Monein (pop. 5026 whole commune), on the Luzon; and Luc, between the Luzon and the Gave d'Oléron. Laruns is frequented by the persons who resort to the waters of Les Eaux Chaudes and Les Eaux Bonnes, which are in the neighbourhood. The waters of Les Eaux Bonnes are furnished by three sources; they acquired great reputation in the sixteenth century from their efficacy in curing some Béarnais soldiers wounded in the battle of Pavia, who called them 'Les Eaux des Arquebusades.' They have since been in repute for their efficacy in pulmonary complaints, and are among the most frequented mineral springs of the Pyrénées. The springs of Les Eaux Chaudes are five in number: they are recommended in asthmatic complaints, paralysis, and rheumatism. Some trade in wine is carried on at Monein. Luc is a well built place in a pleasant situation, with a population of from 2000 to 3000.

In the arrondissement of Orthès are—Orthès (pop. in 1831, 3195 town, 7121 whole commune; in 1836, 7857 commune) [ORTHES], and Lagor, on or near the Gave de Pau; Navarreins, Sauveterre, and Salies (pop. 4730 town, 5420 whole commune), on or near the Gave d'Oléron; La Bastide de Béarn, near the Seison; Moriane, on the Luy de Béarn; Arthès, between the Gave de Pau and the Luy de Béarn; and Arzacq, near the Louts. Navarreins is a fortress of little strength; it was founded by Henri of Albret (maternal grandfather to Henri IV.) in 1569, and resisted an attack of the Catholic army in the religious wars of that century. It is built with tolerable regularity, with broad and straight streets, and is in a fertile plain on the right bank of the Gave d'Oléron, over which there is a stone bridge at the junction of two brooks. There are barracks and a prison. Some weaving is carried on by the townsmen, who scarcely amount to 1500. Salies owes its prosperity to two brine-springs, from which a very white salt is made, and to the hams cured in and about the town, which are exported under the name of Bayonne hams.

In the arrondissement of Bayonne are—Bayonne (pop. in 1831, 13,008 town, 14,773 whole commune; in 1836, 15,912), on the left bank of the Adour, a short distance above its mouth [BAYONNE]; Bidache and Guiche, on the Bidouze; La Bastide de Clairence [BASTIDE, LA] and Hasparren (pop. 5357), on or near the Joyeuse; Espelette, on a brook flowing into the Nive; and St. Jean-de-Luz (pop. 2056 town, 2860 whole commune), on the sea at the mouth of the Nivelle. Bidache has a population of from 2000 to 2500: freestone is quarried in the neighbourhood. Hasparren is a busy place, with many tan-yards and currying-shops, the leather made in which is exported to Spain. There is also a considerable trade carried on in cattle both at Hasparren and at Espelette. St. Jean-de-Luz is united by a bridge over the Nivelle, more remarkable for length than for beauty, with the little town or village of Sibourre, the population of which is about 1500 or 2000. St. Jean-de-Luz was formerly a place of considerable trade: in the time of Louis XIV., who was married here to Maria Theresa, Infanta of Spain, it is said to have contained a population of 14,000. It was one of the ports which carried on commerce with the French colonies in America. At present it is much decayed. The harbour is formed by the mouth of the Nivelle, which is tolerably wide, and up which the tide flows. The banks of the river are lined with quays, and the entrance is protected by a pier or breakwater. The inhabitants are chiefly seamen, engaged in the cod or pilchard fishery, or in carrying on some trade with Spain: they are said to speak the Basque tongue with greater purity than any of their neighbours. There is a free-school for teaching navigation. In the neighbourhood of the town some severe fighting took place between the French and Spaniards in 1793, and between the French and the allies under Lord Wellington in 1813-14. At the village of Cambo, on the Nive, are some mineral waters. The bath-rooms, which are of modern erection, are of simple and elegant architecture.

In the arrondissement of Mauléon are—Mauléon (pop. in 1836, 1259 commune) and Licharre, on or near the Seison (which is sometimes called the Gave de Mauléon); Ostabat, St. Palais, and Garris, on or near the Bidouze; and St. Jean-Pied-de-Port, on the Nive. Mauléon was antiently the capital of the valley or district of Soule, and is said to have been the first settlement of the Vascons, or Gascons, on the north side of the Pyrenees. The town is old and ill built, but in an agreeable situation: the population scarcely exceeds 1200. There are two yearly fairs. There are in the town a subordinate court of justice and a high school. St. Palais, a town of 1000 or 1200 inhabitants, is surrounded by an antient wall: it is situated in a fertile corn-district. It was formerly of more importance, and had a mint: it has now a subordinate court of justice. St. Jean-Pied-de-Port is situated, as its name implies, at the foot of one of the ports, or passes, of the Pyrenees: its situation renders it one of the keys of France on this side: its citadel, placed on an eminence, commands the entrance of three gorges, by which there is communication with Spain. The town is small, and has narrow streets, with a church and a prison. The inhabitants, who are about 2000 or 2500 in number, make leather, and carry on trade in wool: there are two cattle-fairs. This town was founded in the eighth century, and was the capital of Basse (Lower) Navarre: it was finally ceded to France by the treaty of the Pyrenees. The village of St. Etienne de Baigorry (pop. 1599 village, 3463 whole commune), was formerly the seat of mining operations of considerable importance: it is in the valley of Baigorry. [BAIGORRY.]

The population, when exactly given, is, unless otherwise described, that of the whole commune, and from the census of 1831.

The department constitutes the diocese of Bayonne, the bishop of which is a suffragan of the archbishop of Auch: it is in the jurisdiction of the Cour Royale and the circuit of the Académie Universitaire of Pau: it is included in the eleventh military division, the head-quarters of which are at Bordeaux: and it sends five members to the Chamber of Deputies. In respect of education, it is above the average of France. Of the young men enrolled in the military census of 1828-29, forty-seven in every one hundred could read and write, the average of France being thirty-nine in every one hundred.

This department was antiently included in the territories of the Tarbelli, who occupied the coast; of the Sibyllates, who are considered to have occupied the valley or district of Soule; of the Osquidates Montani, who probably occupied the valley of Ossau; of the Monesi, whose name may be traced in the town of Monein; and of some other Aquitanian nations, the names of which are not known. In the Roman division of Gaul, it was included in the province of Novempopulana, a subdivision of Aquitania. There were several Roman towns or posts within its limits. Lapurdum, mentioned in the 'Notitia' as a military post, and which has left a trace of its name in the province of Labour, was at or near Bayonne. Carasa and Imus Pyrenaeus (the foot of the Pyrenees), mentioned in the 'Antonine Itinerary,' in the route between Aquae Tarbellicae (Dax) and Pompelo (Pampeluna), were probably at or near Garris and St. Jean-Pied-de-Port respectively: while the Summus Pyrenaeus, which the Itinerary places in the same route, nearer Pompelo, corresponds to the Port de Roncevaux, or Roncesvalles. The Iluro of Antoninus may be easily recognised in Oléron: Aspaluca was probably at the village of Acous, in the valley of Aspe; and Forum Ligneum (the wood-mart) was probably at Urdos, higher up the same valley. These two places are mentioned in the route between Iluro and Caesaraugusta (Saragossa) in Spain; the Summus Pyrenaeus of this route was probably the Port de Bernère, between the valleys of Aspe and Aragues. The Beneharnum of Antoninus, which gave name to the province of Béarn, appears to have been between Orthès and Lescar, and the Oppidum Novum of the same writer at Nay.

In the centuries which immediately succeeded the downfall of the Roman empire, the Visigoths, the Franks, the Gascons, and the Saracens at different times occupied this country. It was subsequently included in the empire of Charlemagne; and in the middle ages a large part of it was comprehended in the viscounty of Béarn, which was possessed by the kings of Navarre, and united to the French crown on the accession of Henri IV. [BEARN.] The parts not included in Béarn were:—the Pays de Labour, capital Bayonne; Basse (or Lower) Navarre, capital St. Jean-Pied-de-Port; and the Pays de Soule, or Vallée de Soule, capital Mauléon, all comprehended under the general title of Pays des Basques [BASQUES, PAYS DES], and all included in the military government of Guyenne and Gascogne. [GUYENNE.] Béarn, though properly a part of Gascogne, formed a separate military government.

PYRE'NE'ES, HAUTES, a department in the south of France, bounded on the north by the department of Gers, on the east by that of Haute Garonne, on the south by Spain (from which it is separated by the crests of the Pyrenees), and on the west by the department of Basses Pyrénées. The form of the department approaches to that of a quadrangle, the diagonals of which are its longest dimensions. It length from north-west to south-east, from the neighbourhood of Castelnau de Rivière Basse to the source of the little river Pique at the Port de Picade, at the head of the valley of Luchon, is 75 miles; and from north-east to south-west, from the banks of the Gimone opposite Boulogne, to the source of the Gave d'Azun, 57 miles. The area is estimated at 1825 square miles, being much below the average area of the French departments, and rather less than that of the English county of Northumberland. The population, in 1831, was 233,031; in 1836 it was 244,170: showing an increase in five years, of 11,139, or nearly five per cent., and giving nearly 134 inhabitants to a square mile. In amount of population it is very far below the average of the French departments; in density of population also it is considerably below the average, but exceeds, both in amount and density, the English county with which we have compared it. Tarbes, the capital, is 4[illegible] miles in a direct line south by west of Paris, or 533 miles by the road through Orléans, Châteauroux, Limoges, Cahors, Montauban, Toulouse, and Auch; in 43° 14′ N. lat. [illegible] E. long. [TARBES.]

The surface of the department is very mountainous; the principal ridge of the Pyrenees forms the southern boundary, and the branches from that ridge traverse the department in a northward direction, leaving scarcely any portion of it which can be considered as a plain. The principal of these lateral branches is that which separates the basin of the Garonne from that of the Adour, and which extends through this department into the adjacent department of Gers. That part of the principal ridge which is upon or within the boundary of the department includes some of the loftiest summits of the whole range. Mont Maudit, or Maladetta, and Mont Perdu, lie indeed without the boundary, the first some distance to the south-east, and the second a little to the south; both belong to Spain; but the summits Estos or Bochou, Sîré (Upper and Lower), Baroude, Pic de la Cascade, Les Tours du Marboré, Le Vignemale, Le Taillon, Troumouse, Aiguillon, Campbiel, Pic Long, Neouvielle, Arbizon, Pic-du-Midi de Bigorre, Vignemale, or Vignemale, Badet, Arriau Grand, all of them exceeding 9000 feet, some exceeding 10,000, and one or two rising to more than 11,000 feet, belong to this department; besides a number of other peaks of considerable height. The ports or passes of Clarabide, Lapez, Plan, Viel or Vieux, Pinède or Estaubé, Gavarnie or Boucharo, Campbiel, the Brèche de Roland, and the Brèche de Taque Rouge; the Col de Pinède (otherwise Brèche d'Allanz), and the Cols of Tourmalet, Lavasse, or l'Aspin, and Loudon, also belong to this department. [PYRENEES.] None of the passes are much frequented; perhaps the most so is that of Gavarnie or Boucharo, through which passes the road from Tarbes to Ainsa and Jaca in Spain. Through the Port de Pinède runs another road from Tarbes by the valley of Cauterets to Jaca, and through the Port de Bielsa, a road from Auch by Arreau to Ainsa in Spain. The glaciers of the Brèche de Roland, Vignemale, and Neouvielle belong to this department.

The principal valleys of the department of Hautes Pyrénées are the valley of Barousse, the valley of Louron, the valley of Aure, into which open the valleys of Rioumajou and Campbiel, the valley of Campan, into which opens the valley of Oueil; and the great valley of Lavedan or Barèges, the upper part of which is sometimes called the valley of Gavarnie or of Gèdre, and into which open the valleys of Cauterets, Estaubé, Héas, Pouey-aspé, Campbiel, Troumouse, Bastan, Cauterets, Bun, Azun, Estrème de Salles, and Castel Loubon. We have enumerated the principal valleys in the order in which they occur from east to west; the subordinate valleys, in the order in which they open into the principal ones, commencing at the head of the principal valley on the Spanish frontier. The valleys of Barousse and Campan are a considerable distance northward from the main ridge.

Some of the loftiest mountains of the Pyrenees, as those east of the Port de Clarabide, Vignemale, and Neouvielle, with their respective surrounding peaks, are composed of granitic rocks, which rocks are also found in the upper part of the valley of Lavedan, between Gèdre and Gavarnie, in the valley of Héas, in the upper part of the valley of Aure, near the village of Plan, and in detached portions in one or two other places. The Pic-du-Midi of Bigorre, and the surrounding district, extending eastward to Arreau in the valley of the Neste, and westward to Cauterets, or Cauteretz, in the valley of Cauterets, are occupied by mica-slate. The greater part of the Pyrenees are however composed of transition rocks, namely, clay-slate and grauwacke, in the neighbourhood of the primitive formations, and limestone toward the foot of the chain and the plains at its base. The red sandstone, or red-marl formation, is found in one or two places, chiefly on the east side of the department. A district extending eastward from the neighbourhood of Bagnères de Bigorre, into the department of Haute Garonne, and having no great extent from north to south, is occupied by the Alpine limestone; and small detached masses of secondary trap rocks are found both in the transition and Alpine limestone districts. The rest of the department, north of a line drawn from west to east, from near St. Pé, passing between Tarbes and Bagnères de Bigorre to Barthe de Neste, is occupied by the tertiary formations.

The mineral produce of the department is not great. Some beautiful varieties of marble are quarried in the valley of Campan. There were in the department, in 1834, two establishments containing three forges for making wrought-iron. Charcoal was the fuel employed.

The department belongs partly to the basin of the Adour, and partly to that of the Garonne. The Adour rises at the upper end of the valley of Campan, through which it flows in a northward direction, passing Campan and Bagnères de Bigorre: it afterwards passes Tarbes and Maubourguet, a few miles below which it quits this department to enter that of Gers. The Lechez, which receives the Souy and the Louet, join the Adour on the left bank; the Estéous and the Arros, which last receives the Boues, join it on the right. The Arros and Boues belong partly to the department of Gers; the Louet partly to that of Basses Pyrénées. The upper part of the course of the Gave de Pau [PYRENEES, BASSES] belongs to this department: it waters the valley of Lavedan: the Gave d'Azun and the Gave de Bun, which water the valleys of Azun and Bun, and the Gave and the Lutour, which water the valley of Cauterets, flow directly or ultimately into the Gave de Pau. The principal feeders of the Garonne which belong to this department are the Baïse, the Gers, and the Neste. The two former rise in the eastern part of the department, and flow northward into the department of Gers, the Gers being the more easterly of the two. The Baïsole and the Baïse-devant, which run parallel to the Baïse, and ultimately unite with it, have their springs and their courses between the Baïse and the Gers. The Baïse, before the junction of the Baïse-devant, is sometimes distinguished as the Baïse-derrière. The Neste rises in the south-eastern corner of the department and flows northward to La Barthe de Neste, where it turns eastward and flows into the department of Haute Garonne: at Arreau it receives on its left bank the little river Neste. The Neste above Arreau is sometimes distinguished as the Neste de Louron, and the Neste as the Neste d'Aure. They water respectively the valleys of Louron and Aure. The Lourse is a small feeder of the Garonne, into which it flows a short distance above the Neste. The Garonne itself has a small part of its course on the eastern border of the department, near the town of St. Bertrand in the department of Haute Garonne.

There are no navigable streams or navigable canals in the department. The Garonne is used in this part of its course for floating the fir timber cut in the mountains near it. There are numerous lakes in the Pyrenees, but none of them large. The lake of the Port d'Oo, in the south-eastern corner of the department, is perpetually covered with ice: the lakes of Estom Soubiran, in the valley of Cauterets, are covered with ice till the end of August. The Lac de Gaube, at the head of the valley of Cauterets, abounds with trout. Waterfalls are frequent in the mountains; the most remarkable is the fall of the Gave de Pau at Gavarnie, near its source. It is in an amphitheatre at the head of the valley of Gavarnie, surrounded with walls of rock, which rise to the height of above 1400 feet perpendicular. A dozen of torrents shoot from these stupendous heights; some, dashing upon the projecting precipices, are split into slender jets, which a passing gust of wind converts into a shower; others, of greater volume and force, shoot from the platform and descend unbroken. The fall of the Adour is the most magnificent of these, and surpasses every other cataract in Europe in height.

There are five government roads (routes royales) in this department; their aggregate length is 179 miles, of which (on the 1st of January, 1837) 154 miles were in good repair, 17 out of repair, and 8 unfinished. The principal road is that from Paris by Auch to Tarbes; continued onward from Tarbes by Lourdes, Argelles, and Luz to Barèges, and by Luz and the valley and port of Gavarnie into Spain. Another road from Tarbes to Barèges passes through Bagnères de Bigorre and Campan; and there are roads from Tarbes to Pau (Basses Pyrénées); from Tarbes by Vic Bigorre and Maubourguet to Aire (Landes) and thence to Bordeaux (Gironde); and from Tarbes by Tournay and Lannemezan to St. Gaudens (Haute Garonne) and other towns on the banks of the Garonne. A road from Auch passes along the valleys of the Gers and the Neste to Sarrancolin, Arreau, and Aragnouet, and over the Port de Bielsa to Ainsa in Spain. The departmental roads have an aggregate length of 119 miles, of which (1st of January, 1837) 78 miles were in good repair, 32 miles out of repair, and 9 miles unfinished. The bye-roads and paths have an aggregate length of nearly 3000 miles.

The climate of the department varies with its elevation; from the lofty southern border to the lower grounds of the northern border the vegetation changes from that of the frigid to that of the temperate zone. The surface is estimated in round numbers at above 1,100,000 acres. Of this rather more than 230,000 acres are under the plough: the produce in grain is insufficient for the consumption of the department. Some flax is also grown. The meadows occupy about 110,000 acres, and the heaths and open pasture-grounds, chiefly on the slopes of the Pyrenees, amount to about 430,000 acres; the lower slopes furnish the winter pasturage and the upper valleys the summer pasturage for the numerous flocks and herds belonging to the active and intelligent peasantry who inhabit the mountains. When the uplands are cleared from snow, the peasant drives his flock or herd up to them; he finds his summer abode in some cleft, or in a cabin previously erected, or, in want of this, builds himself a hut of rude stones. On the approach of winter he drives his cattle to the lower ground, and occupies the hut which has served as a summer habitation to his family, who now descend into the village. Round this hut the fodder which is to assist in sustaining his cattle in the winter is grown; and the skill shown by the peasantry in irrigating their meadows is considerable. The oxen are commonly poor, but some good butter is made. Horses are little used in agriculture, but very much for carrying produce: they are an ill-looking though active race. Mules are bred in considerable number for exportation to Spain, and several of them are fine animals.

The vineyards occupy nearly 40,000 acres: the best red wines are grown in or near the valley of the Louet, about Castelnau-de-Rivière-basse and Madiran. A considerable part of the wine produced in the department is converted into brandy. There are about 6000 or 6500 acres of orchard or garden ground; and the osier beds cover more than 4000 acres. The woods comprehend an area of 200,000 or 210,000 acres.

The department is divided into three arrondissements, as follows:—

Name.	Situation.	Area in sq. miles.	No. of Communes.	Population in 1831.	1836.
Tarbes	N.	505	197	104,022	110,542
Argelès	S.W.	518	100	39,785	40,582
Bagnères	E.	730	195	89,224	93,046
		1753	492	233,031	244,170

There are twenty-six cantons, or districts, each under a justice of the peace.

In the arrondissement of Tarbes are—Tarbes (pop. in 1831, 9706; in 1836, 12,630) [TARBES], and Maubourguet (pop. 1506 town, 1725 whole commune), on the Adour; Vic-Bigorre (pop. 3599 town, 3679 whole commune), on the Lechez; Ossun (pop. 3243) and Ibos, on the Soui; Castelnau-de-Rivière-basse and Madiran, on or near the Louet; Rabastens, on the Estreux; Tournay and St. Sever, on the Arros; Trie, on the Baise-derrière; and Gallan, on the Baise-devant. Maubourguet has a parish church of great antiquity, built by the Templars; it is of singular architecture, the style being of a mixture of Gothic and Oriental. Vic-Bigorre has brandy-distilleries and tan-yards. The people of Ossun are distinguished from their neighbours by the singularity of their dress, language, and manners; they trade in hams. Castelnau-de-Rivière-basse is on a tolerably extensive eminence commanding the surrounding plain. It has a pretty good 'place,' or square, at one corner of which is the parish church. It has also a market-house. Rabastens was antiently fortified; it was taken and burned by the Roman Catholics under Montluc in the religious wars of the sixteenth century, and the townsmen massacred. The population is about 1500. There are several fairs in the year. Tournay is tolerably well built, with a very large 'place,' or square; but it is a very small town. It has several fairs. St. Sever, distinguished as St. Sever-de-Rustan, has the remains of the large and fine Benedictine Abbey of St. Sever, to which the town owes its name. Trie is tolerably built, and has a large square surrounded with a wooden arcade or piazza. The church is remarkable for its solid architecture and the loftiness of its spire; and there is a bridge over the Baise-derrière, of one arch, very lofty in order to give free passage to the floods to which that river is subject. Gallan, or Galan, is agreeably situated, and has a very antient parish church. It has four yearly fairs for cattle, mules, and corn.

In the arrondissement of Argelès are—Argellès, or Argellez (pop. in 1836, 1420 for the commune), Lourdes (pop. 3161 town, 3818 whole commune), St. Pé (pop. 1983 town, 2754 whole commune), and Lus, or Luz (pop. 1934 town, 2357 whole commune), on the Gave de Pau; Cauterez, on a feeder of the same river, in the valley of Cauterez; and Barèges, on another feeder not far from Lus. Argelès is situated in a delightful valley, abounding in fruits of every description: it has a high school, and a church of very massive architecture. Lourdes is built at the foot and on the side of a hill, the summit of which is occupied by the remains of an antient castle, now used for a prison. The fortifications of the castle were improved by Edward the Black Prince when duke of Aquitaine; and it was long and gallantly defended by the partisans of the English, until the entire expulsion of the latter from this part of France. Lourdes has an hospital; and the court of justice for the arrondissement has its seat here. There are several tan-yards; linens are manufactured, and there are four yearly fairs for corn, horses, and mules. Marble and slate are quarried in the neighbourhood. There are some remains of Roman architecture at Lourdes. St. Pé is surrounded by mountains and forests. It is a curious old town. The inhabitants manufacture linens, handkerchiefs, combs, nails, and tools. Lus, or Luz, has narrow streets and old houses. The church, built by the Templars, appears to have been designed for the purpose of defence: it is surrounded by a high wall provided with embrasures. The townsmen manufacture a fabric of silk and wool mingled. About half a mile from Luz, in a picturesque situation, are the baths of St. Sauveur, resorted to by a considerable number of visitors. In the neighbourhood are the ruins of the castle of St. Marie. Cauterez is built in a valley in the neighbourhood of some of the highest mountains and some of the finest scenery of the Pyrenees. It is a fashionable watering-place. The baths are higher up the valley, at some distance from the town; they are adorned with Grecian porticos, esplanades, and terraces. Those persons who cannot walk from the town to the baths are carried in a kind of chair or palanquin by porters. Barège has been described elsewhere. [BARREGE.]

In the arrondissement of Bagnères are—Bagnères de Bigorre (population in 1831, 5633 town, 7586 whole commune; in 1836, 8108 commune) [BAGNERES DE BIGORRE], and Campan (population 3015 town, 4171 whole commune) [CAMPAN], on the Adour; Ansizan, Arreau, and Sarrancolin, on the Neste; Lannemezan, on the Baise-devant; and Monléon and Castelnau de Magnoac, on or near the Gers. Arreau is a very old town; the inhabitants (who are about 1300 to 1500) manufacture the coarse woollens worn by the surrounding peasantry, and woollen hose. Sarrancolin, another old town, has a church built by the Templars. Paper is made in the town, and marble is quarried in the neighbourhood. Lannemezan is a dull place; it has however several considerable cattle-fairs. Monléon is pleasantly situated. At Castelnau de Magnoac considerable trade is carried on; wax is bleached, and wax candles and woollen stuffs manufactured.

The population given above, when given exactly, is (unless otherwise described) that of the commune, and from the census of 1831. When given approximately, it is from returns of an older date.

The department constitutes the diocese of Tarbes, the bishop of which is a suffragan of the archbishop of Auch. It is included in the jurisdiction of the Cour Royale of Pau, and in the circuit of the Académie Universitaire of the same city: it is in the tenth military division, the head-quarters of which are at Toulouse; and it sends three members to the Chamber of Deputies. In respect of education, it is considerably above the average of the French departments. Of the young men who were enrolled in the military census of 1828-29, 53 in every hundred could read and write; the average of France being 39 in every hundred.

This department was antiently comprehended in the territories of the Bigerrones, the Convenæ, the Ausci, the Camponi, the Onobusates, the Tornates, and other Aquitanian nations. The Bigerrones occupied the western, the Convenæ the eastern, and the Ausci the northern part. The Camponi probably occupied the valley of Campan; the Onobusates probably the district of Nébouzan in this department and in that of Haute Garonne. On the subjugation of Gaul, these nations were included in the Roman province of Aquitania, and on its subdivision, in that of Novempopulana. There were several Roman towns or posts within the limits of the department. Turba, now Tarbes, is mentioned in the 'Notitia,' with the description 'ubi Castrum Bigorra.' Gregory of Tours calls it Civitas Bigorra, and it was the capital of the Bigerri or Bigerrones.

who have left their name to the province of Bigorre. A place called Aquae or Aquensis Vicus is shown, by some Roman inscriptions found there, to have been at Bagnères de Bigorre. Tournay, to judge by its name, was probably the capital of the little tribe or nation of the Toruates. Aquae Convenarum, mentioned by Antoninus, was probably Capbern or Capvern, near Lannemezan, where there are still some tolerably frequented mineral springs. Belsinum, also mentioned by Antoninus, may probably be fixed in the neighbourhood of Castelnau de Magnoac, about upon [illegible] within the boundary of the department.

At a subsequent period, these territories were conquered by the Visigoths, Franks, Saracens, and Gascons. In the middle ages, the western side, except just the north-western extremity, constituted the county of Bigorre [Bigorre], subdivided into 'La Plaine,' the district north and west of Tarbes; Le Rustan, about St. Sever; and Les Montagnes, including the valleys of Lavedan, Campan, Barèges, and Azun. The rest of the department, except the valleys of Luchon and [illegible] in the south-eastern corner, which belonged to the district of Comminges (Comminges), was included in Armagnac [Armagnac]. Of this part the north-western extremity, about Castelnau de Rivière-basse, constituted the district of Rivière-basse, in Basse or Noir (Lower or Black) Armagnac: the remainder was divided between the county of Astarac, Les Quatre Vallées or the Four Valleys (of Magnoac, Neste, Aure, and Barousse), and Le Nebouzan, all in Haut or Blanc (Upper or White) Armagnac. These districts were comprehended in the province of Gascogne. [Guyenne and Gascogne.] Bigorre was included in the duchy of Aquitaine or Guienne, as established by the treaty of Bretigny (A.D. 1360), and its strongholds were held by the English for several years. It afterwards came to the kings of Navarre, and, on the accession of Henri IV., was united to the crown of France.

PYRÉNÉES ORIENTALES, a department of France, situated, as its name implies, at the eastern extremity of the Pyrenees. It is bounded on the north by the department of Aude, on the north-west by that of Arriége, on the west and south by the province of Catalonia in Spain (from which it is for the most part separated by the Pyrenees), and on the east by the Mediterranean. Its form approximates to that of a wedge or triangle, having its sides respectively facing the north-north-west and the south; the shore of the Mediterranean representing the back or base, and the upper extremity of the valley of Carrol the point: the side toward the north-north-west is about seventy miles long, the side towards the south seventy-five miles; the length of the back or base is little more than twenty-nine miles. The area is estimated at 1592 square miles, about two-thirds of the average area of the French departments; rather greater than the area of the English county of Kent, but rather less than that of Hampshire. The population, in 1831, was 157,052; in 1836, it was 164,325, showing an increase in five years of 7273, or more than 4½ per cent.; and giving 103 inhabitants to a square mile. Both in amount and density of population it is far below the average of France; in amount little more than two-fifths, and in density less than two-thirds of the average. Its population is about half that of Hampshire, and one-third that of Kent. Perpignan, the capital, is 423 miles in a straight line south of Paris, or 562 miles by the road through Orléans, Limoges, Cahors, Montauban, Toulouse, Carcassonne, and Narbonne; in 42° 42′ N. lat. and 2° 54′ E. long.

The coast runs from the northern boundary to the neighbourhood of Collioure, about twenty-one or twenty-two miles due south, in an almost direct line; it is throughout all this extent skirted by a low alluvial tract overspread with marshes, whose exhalations would be seriously injurious to health if it were not for the corrective influence of the keen north-west wind, called, from its blowing across the Corbières, a branch of the Pyrenees, the 'Tramontane.' In the northern part of this line of coast, partly in this department and partly in that of Aude, is the étang (pool or lagoon) of Leucate, and south of this are the smaller lagoons of St. Nazaire and St. Cyprien, all belonging to that line of étangs which characterises the French part of the Mediterranean coast. From the neighbourhood of Collioure the coast turns to the south-east, and its loftier character and more broken outline indicate its vicinity to the Pyrenees. The French portion of it terminates at Cape Cerbère or Cerbère, about eight or nine miles from Collioure.

The greater part of the department is of very mountainous character. The Pyrenees commence on the east coast and run westward, their principal ridge forming the frontier of the department toward Spain, and throwing off two subordinate lateral ranges in a north-east direction; one of which, not distinguished by any particular name, but remarkable for one of its mountains, Le Canigou, separates the valley of the Tech from that of the Tet or Teta; the other, the Corbières, separates the valley of the Teta from that of the Aude. From the Col de la Couillade, south of the fortress and town of Montlouis, the principal ridge lies within the boundary of the department, which includes the valley of Carrol or Carol and the other valleys drained by the upper waters of the Sègre on the southern slope. A branch of the Pyrenees forms the western boundary of the valley of Carrol. The peaks of Le Canigou in the branch range which separates the valleys of the Tech and the Tet; Peyric or Puigmal, at the head of the valley of the Teta; Lanoux, at the head of the valleys of the Arriége and of Carrol; and Pedrous, near Lanoux, all exceed 9000 feet in height, and the last rises to about 9500 feet. [Pyrenees.] The mountain of Mosset, one of the Corbières, has an elevation of 7820 feet; and Roc Blanc, at the separation of the Pyrenees and the Corbières, at the head of the valley of the Aude, of 8740 feet. The principal valleys are those of the Tech, between the branch to which Mount Canigou belongs and the main ridge of the Pyrenees; of the Tet, between this same branch and the Corbières; of the Gly, between the branches of the Corbières; and the valley of Carol (the stream from which joins the Sègre at Puycerda in Catalonia), and the other valleys drained by the upper waters of the Sègre. The principal depressions or passes are the Col de Pertus, through which runs the main road from Perpignan to Figueras in Spain; the Col de la Perche, through which passes the road from Montlouis to Puycerda and Urgel in Catalonia; the Col de la Marguerite, between the valley of the Teta and that of the Aude; and the Col de la Couillade, at the head of the valley of the Sègre. The bridge of Céret, a small town in the valley of the Tech, is 317 feet above the level of the sea; the town of Arles 889 feet, the village of Montferrer 2540 feet (both these are in the same valley), and the town of Montlouis 5206 feet.

The Pyrenees are in this part composed almost entirely of granitic rocks, as also is that part of the Corbières which lies nearest to the Pyrenees. Not only the peaks, but the intervening valleys are in great part occupied by these formations. This is the case with all that part of the valley of the Aude which lies in this department, with the valley of the Teta or Tet nearly down to the town of Millas, except just about Villefranche, and with the valley of the Tech to the village of Le Fort between Arles and Céret, except in the vicinity of the fortress of Prats-de-Mollo and the village of Le Tech. The mountains which bound the valley of the Aude on the western side, and occupy the extremity of the department toward the west, are composed of mica-slate, which is not found anywhere else in this department. The transition rocks are found near the base of the granitic mountains, except where their continuity is interrupted by the tertiary or alluvial beds. In the valley of the Tech above Céret, and extending northward across the extremity of that small branch mountain-range to which Le Canigou belongs, these transition rocks consist of clay-slate and transition limestone. A mass of similar formations occupies the upper part of the valley of the Tech, in the vicinity of Prats-de-Mollo and Le Tech. About Villefranche, in the valley of the Tet, is found a mass of compact grey limestone, enclosing beds of grey marble veined with red and green, probably belonging to the transition series. The localities occupied by these two masses of transition rocks are isolated in the district of the granitic formations. The valley of the Gly from Estagel upwards, and that part of the Corbières which lies at the head of the valley, are formed of transition rocks, which skirt the granitic district on the north side, and extend northward and westward into the department of Aude: the predominant rock is compact grey limestone. The valley of Carol and the valleys watered by the tributaries of the Sègre are, in this department, occupied by the transition rocks. A small portion of the department to the north of Estagel is occupied by the Alpine and Jura limestone, which formations extend northward into the department of Aude, where they overspread a large district. All the eastern side of the department, comprehending the sea-coast, the plain which extends for some miles inland from the coast, and the valleys of the Gly, the Tet, and the Tech, to near Estagel, Millas, and Céret respectively, are occupied by tertiary or alluvial formations, chiefly consisting of vast beds of sand or gravel. The mineral treasures of the department are inconsiderable. There are twenty establishments, each comprehending a single forge, for the manufacture of wrought-iron. Charcoal is the only fuel employed.

The department has no large rivers: three small portions, all near the western end of the department, belong to the basins of the Garonne, the Ebro, and the Aude. These portions are drained respectively by the Arriège, the Sègre, and the Aude, all of which have their rise and a small part of their course in this department. The Aude receives two small mountain-streams, the Balcerre and the Galba; the Sègre receives the Carrol or Carol from the valley of Carol, the Err, and the Vanera. The Tech rises in the Pyrenees on or near the southern boundary of the department, and flows about 40 to 45 miles east-north-east past Prats-de-Mollo, Arles, Céret, and Elne, into the Mediterranean. The Tet or Teta rises in the Pyrenees near the junction of the Corbières, and flows about 12 miles south-east to Montlouis, and from thence east-north-east about 50 to 55 miles, making its whole course 62 to 67 miles, past Olette, Villefranche, Prades, Vinçac, Ille, Millas, and Pepignan, into the Mediterranean. Between Ille and Pepignan, it is divided into two arms, enclosing between them a large island: the northern and principal arm retains the name of Tet; the southern, which passes by Thuir, is called the 'Canals.' The Tet receives below Montlouis the Carensa, the Lantilla, and the Boules on the right bank; the Cabrils and the Castellanne on the left. The Gly rises in the department of Aude, and flows about 40 miles, first south-east and then east, past St. Paul-de-Fenouillet, La Tour-de-France, Estagel, and Rivesaltes, into the Mediterranean; receiving on the left bank the Verdouble and the Robouls. Its course is mostly in this department. The Cantarana has its course parallel to and between the Tech and the Tet, and flows into the étang of St. Nazaire: it receives the Reart. There are some small lakes in the mountains, and the étangs of St. Cyprien, St. Nazaire, and Leucate on the coast. None of the rivers are navigable, neither are there any navigable canals.

There are in the department seven Routes Royales or government roads, having an aggregate length of 202 miles, viz. 103 miles in repair, 9 miles out of repair, and 90 miles unfinished. (1 Jan., 1837.) The principal road is that from Paris to Perpignan, which enters the department on the north side, close to the western bank of the étang of Leucate, and runs south to Perpignan; from whence it continues through Le Boulou and the fortress of Bellegarde, by the Col de Pertus into Spain. From Perpignan a road runs south-east through Elne, Argelès, Collioure, and Port Vendres into Spain. Another road from Perpignan follows the valley of the Tet by Ille, Vinçac, Prades, Villefranche, Olette, Montlouis, and Livia, by the Col de la Perche, to Puycerda and Urgel in Spain. Another road from Perpignan runs north-west to the valley of the Gly, and passes through Estagel, St. Paul de Fenouillet, and Caudies to Quillan in the valley of the Aude, forming part of a road which crosses France on the northern side of the Pyrenees from Perpignan to Bayonne. From Le Boulou, on the main road into Spain, between Perpignan and Bellegarde, a road runs up the valley of the Tech by Céret and Arles to Prats de Mollo. A road from Carcassonne, Limoux, and Quillan, in the valley of the Aude, runs up the valley, and crosses the mountains at its head to Montlouis, in the valley of the Tet. The aggregate length of the Routes Departmentales is 81 miles, viz. 27½ miles in good repair, 8½ miles out of repair, and 45 miles unfinished. The bye-roads and paths have an aggregate length of nearly 2000 miles.

The climate of the department is generally mild and temperate. The soil of the plain and of the valleys of the Tech and the Tet is remarkable for its fertility. Of the whole area of the department, which is estimated at about 1,000,000 acres in round numbers, about 230,000 acres, or less than one-fourth, are under the plough. The quantity of grass-land is small, comprehending little more than 24,000 acres; but the heaths and open pasture-grounds are extensive, amounting to nearly half the area of the department. The number of cattle is small; but sheep, including Merinos, are numerous, and the Cashmere or Thibet goat has been naturalised. Mules are reared in considerable numbers; and the breed of horses, already in good repute, is improving. The slopes of the mountains and other uncultivated lands are covered with thyme, rosemary, lavender, and various odoriferous shrubs or herbs, which furnish nourishment to swarms of bees, whose honey and wax form an important article of produce. The vineyards occupy from 90,000 to 100,000 acres: the produce is considerable, and about two-fifths of it are exported. The wines of the first quality are those of Rivesaltes, Salces, and Collioure. Part of the wines are liqueur wines. Orchards are not numerous, occupying only about 3000 acres; but the quantity of fruit grown is very considerable; among the kinds cultivated are the olive, the orange, the citron, the mulberry, and the melon; oil is made and raw silk produced. The woodlands amount to about 110,000 acres.

The department is divided into three arrondissements, as follows:—

Name.	Situation.	Area in sq. miles.	No. of Communes.	Population in 1831.	Population in 1836.
Perpignan	N. and N.E.	531	85	72,814	76,134
Céret .	S. and S.E.	358	41	35,421	37,539
Prades .	W.	705	100	48,817	50,652
		1594	226	157,052	164,325

There are seventeen cantons, or districts, each under a justice of the peace.

In the arrondissement of Perpignan are—Perpignan (pop. in 1831, 16,272 town, 17,114 whole commune; in 1836, 17,618 commune) [PERPIGNAN], and Millas (pop. 1881 town, 1970 whole commune), on the Tet; Thuir (pop. 2069 town, 2197 whole commune), on the Canals; Elne (pop. 1921 town, 2093 whole commune), on the Tech; Caudiès, St. Paul de Fenouillet (pop. 1665 town, 1743 whole commune), La Tour de France, Estagel (pop. 2003), and Rivesaltes (pop. 3208), on the Gly.

At Thuir, paper is manufactured from straw and leather. A battle was fought near this town in 1793, between the French and Spanish armies. Elne is of great antiquity; it was known to the Romans by the name of Illiberis, and subsequently of Helena, from the mother of the emperor Constantine, who rebuilt it and gave it her own name. Hannibal encamped under its walls. (Livy, lib. xxi., c. 24.) It was formerly an episcopal city, and a place of strength, but has been ruined by successive sieges. The see was transferred to Perpignan in 1604; but the antient cathedral is still standing. At St. Paul de Fenouillet some trade is carried on in Spanish wool. Rivesaltes is in a fertile plain surrounded by vine-clad hills. Part of the town is within the walls, and part without; the latter is the better built. The townsmen trade in the excellent liqueur wines produced in the neighbourhood and in brandy.

In the department of Céret are—Céret (pop. in 1831, [illegible] town, 3251 whole commune; in 1836, 3302 commune), Prats de Mollo (pop. 3484), Arles (pop. 1792 town, 2166 whole commune), and Le Boulou, all on the Tech; St. Laurent or Laurent (pop. 3119 town, 3207 whole commune), on a feeder of the Tech; Bellegarde, on the Col de Pertus in the Pyrenees; and Argelès, Collioure, and Port Vendre, on or near the coast. Céret has a bridge of one arch over the Tech, on the right bank of which river the town is built. It has a court of justice and a high school. The town is surrounded by lofty antient walls. Prats de Mollo was fortified in 1100, and again in 1679 with the addition of Fort La Garde, after the plans of Vauban. It was unsuccessfully besieged by the Spaniards in 1793. There is a stone bridge over the Tech, an hospital, and barracks. Coarse woollen cloth, blankets, and hosiery are manufactured; and considerable trade in these articles is carried on. There are mineral waters at Arles. Cork is prepared at Le Boulou. Bellegarde was regularly fortified by Louis XIV., and is a place of strength, and of importance from its position. It was taken by the Spaniards in 1793, and retaken in 1794 by the French under Dugommier. Collioure is defended by an old wall, and by a castle and three forts built on the neighbouring heights. The streets are narrow. The church is built on the sea-shore. There is a school of navigation, and there are two ropewalks. The townsmen carry on some trade with Spain, and are engaged in the pilchard fishery. Port Vendre has a safe harbour capable of containing 500 vessels; the entrance is defended by four batteries, in one of which is a lighthouse: on the land side the town is protected by Fort St. Elme on the west, and by another fort on the south. The townsmen (who amount to 2000 or more) carry on trade in corn, wine.

brandy, woollen stuffs, and hardwares. Port Vendres which was previously of no importance, owes its prosperity to the Maréchal de Mailly, who repaired its harbour. Both this town and Collioure were taken by the Spaniards in 1794, and retaken the same year by the French.

In the arrondissement of Prades are—Prades (population in 1831, 2768 town, 2838 whole commune; in 1836, 3013 commune), Montlouis, Olette, Villefranche, Vinçac or Vinça (population, 1851 town, 2004 whole commune), and Ille (population, 2914 town, 3102 whole commune), all on the Tet; Mosset, near the foot of the Corbières, on a feeder of the Tet; Sournia, on the Desix, a feeder of the Gly; and Livia, in French Cerdagne, on the Sègre. Prades is a small ill-built town, but very clean, in a valley on the right bank of the Tet. It has a court of justice, one or two fiscal government offices, a seminary for the priesthood, and a high school. The townsmen manufacture coarse woollen cloth, woollen hosiery, and paper, and carry on trade in wine, wool, honey, pulse, and fuel. A great number of sheep, whose wool is of excellent quality, are fed in the neighbourhood. Prades was taken by the Spaniards in 1793, and retaken the same year. Montlouis has the most elevated site of any town in France, and indeed in all Europe. It was fortified by Vauban, by order of Louis XIV. It has a quadrangular citadel. The town is well laid out, with eight streets and several places or squares, of regular form; the esplanade is extensive and well arranged. The works are chiefly built of granite. There are a military hospital and very fine barracks. Olette has warm mineral springs, but they are of little note. Villefranche has two stone bridges over the Tet. The town, which is very small, having but two streets, is defended by a wall flanked at the angles with bastions, and also by a strong castle, built by order of Louis XIV. There are barracks and a military hospital. Marble and variegated breccia are quarried in the neighbourhood. Vinçac or Vinça is surrounded by an old wall, and has two suburbs larger and handsomer than the town itself, which is ill laid out and ill built; there are fountains of excellent water in the street. There is an hospital or almshouse. Iron-ore is obtained in the neighbourhood. Ille is surrounded by walls flanked by towers; it is a well-built town, with three churches and an hospital. Considerable trade is carried on in the fruit produced in the surrounding district, and there are two yearly fairs for cattle and agricultural produce. Livia has an antient parish church and the ruins of an old castle. The townsmen manufacture hosiery. The possession of this little town, which is in French Cerdagne, close upon the frontier, is by some of our authorities assigned to Spain.

The department constitutes the diocese of Perpignan, the bishop of which is a suffragan of the archbishop of Alby; it is in the jurisdiction of the Cour Royale and in the circuit of the Académie Universitaire of Montpellier, and in the tenth military division, the head-quarters of which are at Toulouse. The department sends three members to the Chamber of Deputies. In respect of education it is below the average of the departments; of the young men enrolled in the military census of 1828-29, thirty-one in every hundred could read and write, the average of the departments of France being more than thirty-nine.

In antient times this department constituted the territory of the Sardones, perhaps some parts of the northern boundary may have been within the limits of the Atacini (the people who dwelt about the Atax or Aude), who were, as well as the Sardones, a Celtic, or possibly a Ligurian people. These nations were early subdued by the Romans, who possessed the whole of the Mediterranean coast before the proconsulship of Cæsar in Gaul; they were consequently included in the 'Provincia' of that writer, afterwards distinguished as the Provincia Narbonensis; and on the subdivision of that province they were included in Narbonensis Prima. The Tet was the Telis of the Romans; the Tech, the Tichis; the Verdoubre, or Verdouble, a feeder of the Gly, and perhaps the lower part of the Gly itself, was the Vernodubrum of Pliny; and the Aude, the Atax. Several Roman towns or posts were within the limits of the department. Ruscino is mentioned by Polybius and Livy, in describing the march of Hannibal. The Gallic chieftains of the district assembled here, on the approach of the Carthaginian army, to deliberate on the part they should take. (Livy, lib. xxi., c. 24.) The name is variously written by antient writers. All that now remains of it is an old tower, two miles from Perpignan, called La Tour de Roussillon, which province obtained its name by a corruption of the antient Ruscino, which in the middle ages was called Rossilione. Perpignan grew out of the ruin of Ruscino, which was ruined by the Normans.

The Combusta of the 'Itinerary' of Antoninus was north of Ruscino; the Salsulae of Mela may be identified with the modern Salses, on the west side of the Etang de Leucate, not only by the name, but by the occurrence of a phenomenon mentioned by the Roman geographer, viz. the occurrence of springs producing water salter than the sea. The Ad Stabulum of Antoninus has left a fragment of its name in Le Boulou, on the Tet; the Ad Centuriones of Antoninus (the Ad Centenarium of the Peutinger Table) was probably near it; and the Summum Pyrenaeum, which is marked by Antoninus on the route from Narbo and Ruscino into Spain, may be identified with the Col de Perthus, at the fortress of Bellegarde. The Portus Veneris of Mela and the Fanum Veneris of Strabo, Pliny, and Ptolemy, are easily recognizable in Port Vendres; and Illiberis, afterwards Helena (as already noticed), is the modern Elne. The Etang de Leucate is mentioned by Festus Avienus under the name of *Stagnum Sordicum*, or, according to the correction of Isaac Vossius, *Sordicum*. The same writer (Festus Avienus) applies the term Cynaticum Littus to the coast near the foot of the Pyrenees.

On the downfall of the Roman empire this territory came into the hands of the Visigoths, and was for several centuries attached to their monarchy; it was taken from them by the Moors, and from the Moors by the Franks. In the middle ages it was known as the province of Roussillon, and was alternately possessed by France and by Aragon (subsequently by Spain) until 1640, when it was finally incorporated with France.

PYRE'NE'ES SUPE'RIEURES, referred to by oversight instead of PYRENEES, HAUTES.

PYRENESTES, Mr. Swainson's name for a subgenus of *Coccothraustes*. [FRINGILLIDÆ.]

PYRGITA. [SPARROW.]

PYRGO, a genus of microscopic FORAMINIFERA.

PYRGO'MA. [CIRRIPEDA, vol. viii., p. 202.]

PYRGO'TELES, the most eminent engraver of gems of his age. He was a native of Greece, but the place of his birth is not recorded. He was contemporary with the most distinguished artists who were living in the last period of fine art in Greece, and after whom that which is termed the *high* style deteriorated. The leading sculptors of the time were Lysippus, Scopas, and their followers; Apelles and Protogenes were the chief painters; and Pyrgoteles ranked in his own art equally with those celebrated names. Alexander the Great conferred the same honour upon Pyrgoteles that was extended to Lysippus and Apelles, who had the exclusive privilege of representing him in their respective arts. In like manner he forbade any artist to engrave gems of him but Pyrgoteles. 'Idem hic Imperator edixit ne quis ipsum alius quàm Apelles pingeret; quàm Pyrgoteles sculperet; quàm Lysippus ex aere duceret.' (Plin., *Hist. Nat.*, vii. 37.) Again, '—— edictum Alexandri Magni quo vetuit in gemmâ se ab alio sculpi quàm à Pyrgotele.' (xxxvii. 1.)

No well-authenticated work of Pyrgoteles has reached our times. Some writers have supposed that two gems might be attributed to him (Bracci, *Memor.*, tab. 29, 30), but this opinion has been successfully disputed, and is no longer entertained by antiquaries.

PYRITES, COPPER. [COPPER—*Ores*.]

PYRITES, IRON. [IRON—*Ores*.]

PYRMONT is a county belonging to the Prince of Waldeck, about 25 square miles in extent, with 6000 inhabitants, the majority of whom are Protestants, whose chief occupations are agriculture and the breeding of cattle. It is very mountainous and wooded. It yields the prince a revenue of about 8000*l.* per annum, of which the mineral springs alone produce nearly 2000*l.*

PYRMONT, the capital, is a well-built open town, at the northern extremity of a romantic valley on the banks of the river Emmer. The principal street, shaded on both sides by lofty lime-trees, leads to the great avenue and to the celebrated mineral springs, of which there are four. The principal spring, called in former times the Holy Spring, rises at the upper end of the great avenue. The water is as clear as crystal, and has a refreshing taste. With respect to strength and salutary effect on the human body, it has preserved for some centuries the advantage over all other known chalybeate springs. It never freezes. Above 350,000 bottles are annually exported to all parts of the world. The Brodel Brunnen is used only for bathing, the water not being quite clear. The great avenue, 500 paces long and 40 broad, and planted with four rows of fine lime-trees, is the chief place of resort of the visitors, who are very numerous, being about 2000 in a year, and in some years 2500 and more, besides the country-people. On the two sides of the avenue are the coffee-house, the theatre, the assembly-rooms, and a great number of shops. Near it is the great bathing-house, which contains 140 apartments, tastefully fitted up, and handsome spacious baths. There is likewise a salt spring at which other baths have been fitted up. A few hundred paces from the great avenue stands the palace of Pyrmont, which has been the residence of the Prince of Waldeck ever since 1806. In a valley near Pyrmont there is a colony of Quakers, called Friedensthal. (Menke, *Pyrmont und seine Umgebungen*; Pittmann, *Pyrmont*.)

PYROCHLORE occurs in octohedral crystals. Primary form a cube. Cleavage parallel to the faces of a regular octohedron, but very difficultly obtainable. Fracture conchoidal, with a lustre between vitreous and resinous. Hardness 5·0. Colour reddish brown or black. Streak pale. Translucent, opaque. Specific gravity 4·206 to 4·216.

Infusible by the blowpipe; becomes greenish-yellow by calcination. Found at Fredrichswärn in Norway, and in Siberia.

Analysis by Wöhler:—Titanic acid, 62·75; lime, 12·85; oxide of cerium, 6·80; oxide of uranium, 6·18; oxide of manganese, 2·75; oxide of iron, 2·16; oxide of tin, 0·61; water, 4·20.

PYROLIGNEOUS ACID. [Acetic Acid.]

PYROLUSITE. [Manganese.]

PYRO'METER (literally, 'fire-measurer,' from πῦρ, 'fire,' and μέτρον, 'a measure'). No fluid has hitherto been found applicable to the construction of thermometers capable of indicating higher temperatures than that of boiling mercury (about 650° Fahr.). The term pyrometer was first employed by Musschenbroek to designate an instrument invented by him for measuring the effects produced in the dimensions of solid bodies by the application of heat; but the signification of the term has since been extended so as to include those instruments the object of which is to measure all gradations of temperature above those which can be indicated by the mercurial thermometer.

Musschenbroek's pyrometer consisted of a metallic bar, about six inches in length, one extremity of which was fixed, while the other was left free to advance as the metal elongated from the effect of several spirit-lamps placed beneath, which, at each experiment, were charged with the same quantity of highly rectified spirit of wine. The advance of the moveable extremity gave motion to a pinion and wheel, the latter of which drove an index over a graduated circle, each degree of which corresponded to a linear expansion of 12,500th of an inch. The instrument, as it was originally constructed, is described in the second part of Musschenbroek's translation of the 'Saggi di Naturali Esperienze fatte nell' Academia del Cimento,' Leyden, 1731; and as improved by Desaguliers (who substituted fine cords and friction-rollers for the wheel and pinion), in the first volume of his 'Experimental Philosophy,' p. 444.

To Musschenbroek's pyrometer succeeded those of Ellicott (described in the 'Philosophical Transactions' for 1736, p. 297, and 1751, p. 485), Graham ('Phil. Trans.,' 1754, p. 598), Smeaton, Ferguson ('Lectures,' vol. i., pp. 14 and 301), &c., which, like those that have since been constructed, with few exceptions, down to the present time, evince but little originality in the principle upon which they rest. A bar of metal is in most cases subjected to the direct action of flame, or immersed in a fluid of convenient temperature. The minute resulting expansion is multiplied, and thereby rendered appreciable by the intervention of a succession of levers or a system of wheels and pulleys. Supposing this intervening machinery to perform with theoretical accuracy, and that the same quantity of heat is successively communicated to different substances, the indications of such an instrument would give the relative expansions of those substances under the same circumstances. But where wheels, pinions, levers, &c. are employed, there must be considerable liability to error, arising from flexure, obliquity of action, and other causes, the magnitude of which it would be difficult to estimate, and which, even if it be supposed small in the first instance, will be magnified almost in the same proportion as the delicacy of the instrument is increased. Moreover the substance itself, if its nature be such as to be softened by heat, is very liable at high temperatures to undergo compression in giving motion to the machinery. Even therefore as measures of expansion they cannot be considered as deserving of much confidence. A similar remark is applicable, though in a less degree, to the contrivance employed by Lavoisier and Laplace, in which the expansion of the metal deflected a telescope from the position that it had at the commencement of the experiment, and the absolute expansion was deduced from the extent of this deflexion, which was read off upon a graduated scale placed at a considerable distance in front of the telescope. See a description of the apparatus employed in Biot's 'Physique Experimentale,' tome i., pp. 207-9, where also is given a table of the expansions of the several substances experimented on between the temperatures of 32° and 212° Fahr. Troughton, in 1794, constructed an instrument which bore some resemblance to the preceding, the principal difference consisting in the employment of a spirit-level, the deviations of which from the horizontal determined the expansion of the metal.

The 'Phil. Trans.' for 1777 contain a description of the method employed by De Luc in the construction of his compensating pendulums, in order to determine the length of one metal whose expansion is equal to a given length of another metal. For this purpose he suspended the bar of known length from an arm, projecting horizontally from an upright deal plank. To the lower extremity of this bar was adjusted a small horizontal platform, upon which a bar of the other metal rested in a vertical position. Upon raising the temperatures of both bars, every point on the surface of the second bar would obviously become subjected to two motions tending to move it in opposite directions; it would be depressed by the expansion of the first bar, and elevated by the expansion of the second. One point would therefore remain stationary, and this point, being ascertained by raising or lowering a microscope adjusted to the edge of the plank, determined the portion of the second bar, measured from its lower extremity, whose expansion was equal to the whole of the first bar.

The rods employed by Borda in measuring the base-line of the great French Survey consisted of a rule of brass laid upon a somewhat longer rule of platinum and attached at one extremity. The portion of the platinum rule not covered by the one of brass was divided into millionths of the entire length of the rule, and further subdivided by means of a vernier and microscope adjusted to the extremity of the brass rule. The value of each of these divisions having been previously ascertained by first surrounding the compound rule with melting ice, and then immersing it in boiling water, it was only necessary to observe the indications of the vernier in order to apply the requisite correction for reducing the length of the rod to the standard temperature.

For low temperatures, the contrivance of Ramsden, described in the 'Philosophical Transactions' for 1785, and employed by General Roy in determining the expansion of the rods used in measuring the base on Hounslow Heath for the Trigonometrical Survey, was perhaps unexceptionable. The rod was immersed in a trough of water, and over each extremity was placed a microscope, to which a slow motion could be given in the direction of the length of the rod by means of a fine micrometer screw. The lines of collimation of the microscopes being thereby adjusted at the commencement of the experiment so as to accurately coincide with two points near the extremities of the rod, the temperature of the water was gradually raised, till a thermometer placed in the trough indicated an advance of 10°, 20°, 30°, or any required number of degrees. The consequent elongation of the rod destroyed the coincidence of its extremities with the lines of collimation of the microscopes, which was re-established by turning the micrometer screws, and carefully noting the number of turns and fraction of a turn necessary for that purpose; when, the value in parts of an inch of each turn being previously known, a direct measure of the expansion was obtained, free from the errors of a system of levers or of a train of wheels and pinions.

The property of alumina whereby it undergoes a diminution of bulk when heated, was employed by Wedgwood as a measure of high temperatures. His pyrometer consisted of cylinders of fine white clay, and an apparatus for graduately measuring their length. This apparatus consisted of a metallic plate, upon which were fixed two brass rules slightly inclined to each other. The rules used by Wedgwood were 24 inches long, and divided into 240 equal parts. The distance between the rules at one extremity was three-tenths and at the other five-tenths of an inch; consequently the difference between their distances at any two consecutive divisions was the 1200th part of an inch. But it is obvious that these numbers are quite arbitrary; and that by increasing the length of the rules and diminishing their inclination the difference between their distances at any two consecutive divisions may be made as small as we please. The clay cylinders were first baked at a red heat, estimated at 947° Fahr., and then reduced to exactly five-tenths of an inch in length, so as to fit the first division of the scale. When afterwards exposed to a greater heat, they underwent contractions, and the amount of this contraction was determined by observing the division of the scale corresponding to their diminished length. If we then assume, with Wedgwood, that the contraction is proportional to the temperature at which it took place, the latter will likewise be determined; but independently of the difficulty of procuring pieces of clay of uniform composition, from which it resulted that two cylinders of equal length when exposed to the same heat seldom underwent the same degree of contraction, it has been found that the duration of the experiment has considerable influence upon the contraction, the longer continuance of a low temperature producing the same contraction as a higher degree of heat continued for a shorter time. As a measure of temperature therefore this method cannot be relied on, though as a direct measure of expansion we doubt if it has been surpassed either in the simplicity of its principle or in the minuteness of the indications of which it is susceptible. A description of the instrument and of the experiments made with it will be found in the *Philosophical Transactions* of 1782, 1784, and 1786.

A pyrometer was constructed by Achard, similar in form and principle to the common thermometer, but intended to indicate much higher degrees of heat. It consisted of a bulb and graduated tube of semi-transparent porcelain highly baked, and containing a very fusible alloy, composed of bismuth, lead, and tin, which became liquid at about 212°, and indicated higher temperatures by its expansion, which was visible through the semi-transparent tube.

Dulong and Petit employed a very direct mode of measuring the absolute, not linear, expansions of various substances. By observing the difference of altitude at which mercury of different temperatures stood in the two arms of an inverted glass siphon, they determined the absolute expansion of the mercury, and by comparing that with the apparent expansion of mercury in a glass tube, they deduced the absolute expansion of the glass. A cylinder of the metal whose expansion was sought was then placed within a glass tube, closed at one extremity and terminating at the other in a capillary opening, and the rest of the tube occupied with mercury. Upon the whole being heated, a portion of the mercury was expelled equal to the excess of the absolute expansions of the mercury and metal above that of the glass; and as the expansions of the mercury and glass were previously known, the weight of the expelled mercury determined the expansion of the metal.

Dr. Brewster has proposed to measure expansions by the number and intensity of the polarized tints produced by the pressure of a plate of glass against which the expanding substance is made to press. The reader will find some account of this in Brewster's 'Cyclopædia' under the articles 'Pyrometer' and 'Optics.'

Guyton's pyrometer, which was exhibited before the National Institute in 1803, and described in the 'Annales de Chimie,' xlvi., p. 276, and in Nicholson's 'Philosophical Journal,' vi., p. 89, consisted of a bar of platinum nearly two inches in length, placed in a groove of porcelain. One extremity of the bar rested against the solid end of the groove, while the other pressed upon the short arm of a lever, the longer arm of which carried a vernier over a graduated circular arc. The whole was constructed of platinum, and a spring was made to press upon the vernier to prevent its displacement while in the act of withdrawing the instrument from the furnace. The indications of the vernier at the commencement and termination of the experiment were the data from which the expansion was subsequently computed. 'The defect of this instrument,' observes Mr. Daniell, 'arose from the nature of platinum, which at a red heat becomes soft and ductile, so that the lever would be liable to bend, and thereby frustrate the experiment; and this is supposed to have been the reason why the inventor never extended his experiments to temperatures higher than that of the melting point of antimony.'

As early as 1821, the last-named gentleman, Mr. Daniell, the present Professor of Chemistry at King's College, London, had invented an instrument which, he states, 'afforded correct determinations connected in an unexceptionable manner with the scale of the mercurial thermometer;' but it was only suited to the experimental furnace of the chemist, so that, he continues, 'the great desideratum still remained of a pyrometer which might be universally applied to the higher degrees of heat, as the thermometer had long been to the lower, and which, in addition to its use in delicate researches, might effect for the potter, the smelter, the enameller, and others, in the routine of their business, what the latter daily performs for the brewer, the distiller, the sugar-refiner, and the chemist.' The annexed diagram represents the second pyrometer invented by Mr. Daniell, for which the Rumford medal was awarded to him by the Royal Society. A description of it is given in the 'Philosophical Transactions' for 1830, and an account of the experiments made with it is inserted in the 'Transactions' of that and the following years.

It consists of two distinct parts, the register and the scale. The register is a solid bar of black-lead earthenware, DDDD, eight inches long and seven-tenths of an inch wide and thick, cut out of a common black-lead crucible. In this a hole is drilled three-tenths of an inch in diameter, and seven inches and a half in depth. At pp the upper end of this bar, and on one of its sides about six-tenths of an inch in length of its substance, are cut away to the depth of half the diameter of the bore. When a bar of any metal six inches and a half long is dropped into this cavity, it rests against its solid end; and a cylindrical piece of porcelain, q, about one inch and a half long, called the index, is placed on the top of it, which, projecting into and beyond the open part, is firmly confined to its place by a strap of platinum, r, which passing round the black-lead bar and over the piece of porcelain, is made to press upon the latter with any required degree of tension by means of a small wedge s of porcelain inserted between the bar and the strap. When the register is exposed to the heat of a furnace, it is evident that, the expansion of the metallic bar exceeding that of the black-lead, the porcelain index will be forced forward; and when the register is afterwards cooled, the tension of the strap will retain the index at the point of greatest elongation.

The object of the scale is the accurate measurement of the distance through which the index has advanced. It consists of a frame *aaaa* composed of two rectangular plates of brass joined at right angles by their edges, and fitting square upon two sides of the register. At one extremity of this frame is a small plate of brass a', which, when the two former plates are applied to the register, is brought down upon the shoulder formed by cutting away the black-lead at *p*, and the whole may be thus firmly adjusted, when required, to the black-lead bar by three planes of contact. To the outside of this frame is firmly attached, by means of the screws *bb*, a brass plate AA, the extremity of which *d* projects so that a point *c* near to it may be immediately opposite to the cavity in the black-lead bar when the latter is adjusted to the frame. About *c* as a centre, turns an arm *dn*B slightly bent at *n*, carrying at its extremity a graduated circular arc *ee*. The radius of this arc is five inches, and its moveable centre *n* is distant from the fixed centre *c* exactly half an inch. About *n* turns a straight and lighter arm *hg*, five inches and a half in length, the distance from *h* to *n* being half an inch. The extremity *g* of this arm carries a vernier, by which the divisions of the graduated arc are subdivided into minutes, and also an eye-glass *i* to assist the reading. The other extremity terminates in a steel point *h*, or, as the instrument is now constructed, a knife-edge, which, when the register is adjusted to the frame, is inserted in a small cavity *t*, formed for its reception at the extremity of the porcelain index. A small steel spring let into the larger arm at *m* is made to press upon the lighter arm, whereby the latter has a constant tendency to move towards the commencement of the graduation.

When the instrument is used, the metallic bar to be experimented on is placed in the cavity of the register, and the index pressed down upon it and firmly fixed in its place by the platinum strap and porcelain wedge. The scale is then applied by carefully adjusting the frame to the register and fixing it by pressing a' upon the shoulder. Holding the whole together steadily in the left hand, the lighter arm is so placed that the steel point *h* may rest upon the edge of the index, against which it will be pressed by the spring: then by slightly turning the larger arm, the point will move along the surface of the index till it drops into the cavity *t*. The indications of the vernier being then read off, the register is detached from the scale, placed in the furnace, and after it is removed and cooled, it is again applied to the scale in the same manner as before, and the second indication of the vernier noted. From the two readings of the vernier may be deduced the excess of the expansion of the metallic bar above that of the black-lead, though a correct formula for this purpose has not, to the writer's knowledge, been hitherto given.

The one employed by Mr. Daniell, though probably sufficiently correct for all practical purposes, gives the expansions one per cent. too great without exception, and in many cases much more, so that more than the first *significant* figure can seldom be depended upon in those published by him in the 'Philosophical Transactions' of 1830-31. The error thus introduced is perhaps within the limits of the error to which the instrument itself is liable; but should this not be the case, it might be desirable to employ the correct formula, for which reason we subjoin its investigation.

Let *cn*B, *hng*, represent the positions of the two arms of the scale relative to the register, before the expansion has taken place, and *cn'*B', *h'n'g'*, their positions after the expansion; *h* and *h'* the two positions of the steel point, the line joining which passes through the fixed centre *c*; *e* and *e'* the two positions of the zero of the graduated arc. Put the angle $cnB = cn'B' = \alpha$; $enB = e'n'B' = \beta$; eng (the first reading of the vernier) $= \phi$; $e'n'g'$ (the second reading) $= \phi'$; also $cn = cn' = nh = n'h' = r$; and $hh' = \epsilon$, the excess of the expansion of the metal above that of the black lead: then

$$\epsilon = \frac{\sin hnn' - \sin h'n'n}{\sin h'hn - \sin hh'n'} \times \text{chord } nn';$$

$$\begin{aligned} \text{But} \quad hnn' &= 270^\circ - \alpha + \beta - \tfrac{1}{4}(3\phi + \phi'); \\ h'n'n &= -90^\circ + \alpha - \beta + \tfrac{1}{4}(3\phi' + \phi); \\ h'hn &= \tfrac{1}{2}(\alpha - \beta + \phi); \\ hh'n' &= 180^\circ - \tfrac{1}{2}(\alpha - \beta + \phi'); \\ \text{chord } nn' &= 2r \sin \tfrac{1}{2}(\phi' - \phi); \\ &= \sin \tfrac{1}{2}(\phi' - \phi), \text{ since } r = \tfrac{1}{2}. \end{aligned}$$

∴ substituting and reducing by means of the formula

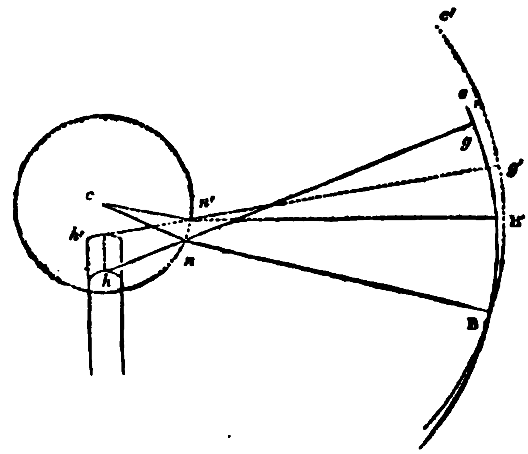
$$\sin A - \sin B = 2 \cos \frac{A+B}{2} \sin \frac{A-B}{2}, \text{ there results}$$

$$\epsilon = 2 \sin \tfrac{1}{2}(\phi' - \phi) \sin \left\{\tfrac{1}{2}(\alpha - \beta) - \tfrac{1}{4}(\phi' + \phi)\right\}$$

If $\alpha = 180^\circ$ and $\beta = 15^\circ$, as is nearly the case, this reduces to

$$\epsilon = 2 \sin \tfrac{1}{2}(\phi' - \phi) \cos \left\{7^\circ\, 30' + \tfrac{1}{4}(\phi' + \phi)\right\}.$$

where the unit of measurement is one inch.



The formula used by Mr. Daniell is $\epsilon = \sin \frac{1}{2}(\phi' - \phi)$, or its equivalent, since $\phi' - \phi$ is generally a small angle, $\epsilon = 2 \sin \frac{1}{2}(\phi' - \phi)$; from which it appears that all the expansions given by him should be diminished in the ratio of $1 : \cos\{7^\circ\, 30' + \frac{1}{4}(\phi' + \phi)\}$; but as he has recorded only the difference $\phi' - \phi$ of the readings of the vernier, and not the readings themselves, this correction can only be made by a repetition of the whole of the experiments. The error is inconsiderable so long as ϕ and ϕ' are both small, but it increases with the increase of either of those angles.

The excess of the expansion of the metal above that of the black-lead being thus obtained, and increased by the expansion of the latter (the determination of which is less direct and conclusive), the expansion of the metal becomes known. In order that the instrument may then be employed as a measure of temperature as well as of expansion, the doubtful assumption is introduced that equal increments of length are the effects of equal increments of temperature, and thence, having determined the expansion between any two known points on the thermometric scale, say the temperatures of melting ice and boiling mercury, a mere proportion will of course give the temperature at which any other observed expansion took place.

It remains to notice a paper communicated to the Royal Society by the late Mr. Prinsep, the assay-master of the Mint at Benares, 'On the Measurement of high Temperatures,' and published in their 'Transactions' for 1828. 'The fusing-points of pure metals,' observes that gentleman, 'are determinate and unchangeable; they also comprehend nearly the whole range of temperature; the unoxidable or noble metals alone embrace a range from the low melting-point of silver to the high ignition of platina. There are it is true only three fixed points in this scale, but as many intermediate links may be made as are required, by alloying the three metals together in different proportions. When such a series has been once prepared, the heat of any furnace may be expressed by the alloy of least fusibility which it is capable of melting.' As the melting-points of silver and gold are comparatively near to each other, Mr. Prinsep assumed only ten intermediate gradations of heat, the lowest of which corresponded to the fusing-point of pure silver, and the others to the fusing-points of silver alloyed with 10, 20, 30, &c. per cent. of gold. From the melting-point of gold to that of platina, he assumed one hundred gradations of heat, which were the melting-points of pure gold and of gold alloyed with 1, 2, 3, &c. per cent. of platina. Among the advantages of this mode of identifying temperatures are:—the smallness of the requisite apparatus, nothing more being needed than a small cupel, containing in separate cells eight or ten pyrometric pieces, each of the size of a pin's head; the indestructibility of the specimens, since those melted in one experiment need only to be flattened under a hammer, when they will be again ready for use; and the facility of notation, since two letters and the decimal of alloy will express the particular heat: thus S ·4 G expresses the temperature of the fusing point of silver when alloyed with gold in the proportion of [illegible]; and G ·23 P expresses the fusing-point of gold when alloyed with platina in the proportion of 77 to [illegible]. For a more particular account of this mode of determining temperatures we refer the reader to the memoir cited.

Several suggestions have been made for employing the expansion of air, on the principle of the differential thermometer, as a measure of high temperatures. It is proposed that one-half of the instrument be composed of platinum, so as to fit it for exposure to a great heat, and the other part of glass. The suggestion, we believe, is originally due to Mr. Schmidt (Nicholson's *Journal*, xi., p. 141); but was brought forward under another form by Mr. Nicholas Mill, in the 'Monthly Medico-Chirurgical Review and Chemico-Philosophical Magazine,' vol. x., Lond., 1824; again by Dr. Ure, in his 'Dictionary of Chemistry;' and lastly by Mr. Prinsep. The instrument, we believe, has been constructed upon each of the plans proposed. That of Mr. Prinsep appears the most complete (see a drawing of the apparatus in full operation at page 57 of his Memoir above referred to), and was employed by him to connect the fusing-points of his alloys with the thermometric scale; but the principle upon which they all rest involves the assumption that the increase of temperature is proportional to the expansion of the air.

A valuable table of the expansions of different substances, collected from various sources by Mr. Francis Baily, is given in the first volume of the 'Transactions of the Astronomical Society,' p. 416.

PYROMORPHITE. [LEAD—*Ores*.]

PYROPHYLLITE (*Radiated Talc*) occurs in fibrous radiating masses, and small prisms of indeterminate form. Hardness 1·5. Colour light green. Lustre pearly, transparent in thin laminæ. Specific gravity 2·8.

Before the blowpipe, exfoliates into white leaves, but does not fuse. With borax, gives a green glass, which becomes colourless when cold; with soda, gives a transparent yellow glass. Occurs near Beresof, in the Uralian Mountains, Siberia.

Analysis by Hermann:—Silica, 59·79; alumina, 29·46; magnesia, 4·00; oxide of iron, 1·80; water, 5·62.

PYRORTHITE occurs imbedded in granite or quartz, in single or aggregated slender columnar masses. Fracture conchoidal, uneven, earthy. Hardness 2·5. Colour blackish brown. Lustre resinous. Opaque. Specific gravity 2·19.

When cautiously heated by the blowpipe it takes fire and burns without either flame or smoke; it afterwards becomes white, and eventually fuses into a black enamel. With borax it gives a transparent glass. Dissolves in acids when heated, except a black powder. It is found near Fahlun in Sweden.

Analysis by Berzelius:—Silica, 10·43; oxide of cerium, 13·92; oxide of iron, 6·08; yttria, 4·87; alumina, 3·59; lime, 1·81; oxide of manganese, 1·39; water, 26·20; carbon and loss, 31·41.

PYROSMALITE occurs crystallized in hexagonal prisms. Primary form a rhomboid. Cleavage distinct, perpendicular to the axis; indistinct, parallel to the planes of the prism. Fracture uneven, conchoidal. Hardness 4·0 to 4·5. Colour greyish yellow. Streak pale. Lustre vitreous, pearly on the cleavage faces. Translucent, opaque. Specific gravity 3·08. When heated in a tube, yields water. Heated with borax dissolves readily, and exhibits the characteristic colours of iron.

It is found at Nordmark in Sweden.

Analysis by Hisinger:—Silica, 35·850; muriatic acid, 2·912; protoxide of iron, 21·810; protoxide of manganese, 21·140; lime, 1·210; water, 2·950.

PYROSPERMA. [SALSACEÆ.]

PYROXENE. This mineral has received various names, probably because it has been found in different countries, and under slightly varying circumstances and properties. The different names by which it has been known are *Alalite*, *Augite*, *Baikalite*, *Coccolite*, *Diopside*, *Fassaite*, *Jeffersonite*, *Malacolite*, *Mussite*, *Pyrgom* and *Sahlite*.

Primary form an oblique rhombic prism. Cleavage parallel to the lateral planes and both diagonals. Fracture uneven, conchoidal. Hardness 5·0 to 6·0. Colourless, grey, black, brown, yellow, green of many shades. Streak paler. Lustre vitreous and vitreo-resinous. Transparent to opaque. Specific gravity 3·23 to 3·5.

Massive Varieties, amorphous. Structure granular, columnar, parallel, and radiating, laminar.

Found in lava and basaltic rocks, and the older rocks in most parts of the earth.

Analysis of the variety called Augite, from Etna, by Vauquelin:—Silica, 52; lime, 13·20; magnesia, 10; protoxide of iron, 14·66; alumina, 3·33; oxide of manganese, 2.

The results of the analysis of the different varieties vary considerably, especially in the proportion of oxide of iron, lime, and magnesia.

PYROXYLIC SPIRIT. This substance was discovered by Mr. Philip Taylor in 1812, but not described by him till 1822, when he gave an account of it in the 'Philosophical Magazine' for that year, under the name of *pyroligneous ether*; its present appellation was given to it by Macaire and Marcet.

When wood is distilled for the purpose of preparing pyroligneous or impure acetic acid, pyroxylic spirit is also formed, and found in the liquid distilled: when this is subjected to rectification, the first tenth part of the product contains the spirit in question. It is purified by repeated rectifications, the last being made over lime, by which a quantity of ammonia is set free that had existed in the state of acetate. Dr. Kane purified it by rectification with chloride of calcium.

The properties of this substance are, that when pure it is colourless, has a peculiar penetrating smell, partaking both of alcohol and æther, and its taste is pungent: its specific gravity at 60° is 0·798, and that of its vapour at 212° is 1·120, that of the vapour of water = 1. It boils at about 150° Fahr. It does not become coloured by exposure to light and air, mixes with water without being rendered turbid, has no action upon vegetable colours, and does not form a black precipitate with protonitrate of mercury. It is an extremely inflammable liquid, and burns without residue; and being cheaper than spirit of wine it is advantageously substituted for it in spirit-lamps, and for the purpose of dissolving resins in rendering certain manufactures water-proof; it is especially employed for this purpose in hat-making. Pyroxylic spirit is similar to alcohol in many of its properties, in density, volatility, inflammability, the solution of resins, and miscibility in all proportions with water: they differ however in one very remarkable circumstance, which is, that pyroxylic spirit yields no æther by the action of acids.

This spirit has been analyzed by Kane and by Dumas and Peligot, with results which very nearly agree:—

	Kane.	Dumas and Peligot.		
Hydrogen . .	12·39	12·49	or 2 eqs.	12·5
Carbon . .	37·15	37·22	„ 1 eq.	37·5
Oxygen . .	50·46	50·32	„ 1 eq.	50
	100·	100·		100·

Dumas and Peligot consider pyroxylic spirit as containing a peculiar carburetted hydrogen, which they call *methylen*, and which is in fact a dicarburet of hydrogen, similar in composition to light carburetted hydrogen gas. It is capable of combining with chlorine, iodine, and other elementary bodies; it unites also with acids to form various compounds, and pyroxylic spirit is an oxide of this carburetted hydrogen.

PYRRHO, a Greek philosopher, and founder of the Pyrrhonian or first Sceptic school, was the son of Pleistarchus, or Pleistocrates, and a native of Elis, a town of Peloponnesus. He lived about the time of Philip and Alexander of Macedonia, and was originally a poor painter; but after having learned the elements of science from Dryson, he followed Alexander the Great in his eastern expedition, and thus became acquainted with the doctrines of the Indian gymnosophists and the Persian magi. (Diog. Laert., ix. 11, 2.) He was also an ardent admirer of Democritus. During the greater part of his life he lived in quiet retirement, abstaining from pronouncing any decided opinion upon anything, and endeavouring to preserve the greatest calmness and composure in whatever circumstances he was placed, so that neither pain nor pleasure affected him. Notwithstanding this apparently inactive and indolent mode of life, he was highly honoured by his countrymen, who not only made him their high-priest, but, for his sake, decreed that all philosophers should be exempt from the payment of taxes. (Diog. Laert., ix. 11, 5.) Pausanias (vi. 24, 4) saw his statue in a portico at Elis, and a monument erected in honour of him at a little distance from the town. The Athenians honoured him with the franchise of their city, though the motive which Diogenes Laertius gives for it is a mere fable. He died at the advanced age of ninety.

An undisturbed peace of mind (ἀπαθία) appeared to him the highest object of philosophy; and thinking that this peace of mind was disturbed by the dogmatic systems and the disputes of all other philosophic schools, he was led to scepticism, which he carried to such a degree, that he considered a real knowledge of things to be altogether impossible, and virtue to be the only thing worth striving after. (Cic., *De Fin.*, iv. 16.) On all occasions therefore he answered his opponents, 'What you say may be true, but I cannot decide.' This and other similar expressions drew upon him the ridicule of his adversaries; and most of the absurd anecdotes respecting his conduct in the common occurrences of life, which Diogenes repeats with all the credulity of a gossip, are probably the fabrications of his opponents, made for the purpose of ridiculing Pyrrho. He had many distinguished followers and disciples, who are called Pyrrhonii, or simply Sceptics: some of them are mentioned and characterised by Diogenes Laertius (ix., c. 7, &c., and c. 12; comp. *Gellius*, xi. 5: and Cic., *De Orat.*, iii. 17). Their doctrines and mode of reasoning are seen clearest in the works of Sextus Empiricus: their object was rather to overthrow all other systems than to establish a new one; hence we can scarcely speak of a school of Pyrrhonists, inasmuch as they opposed every school. The whole philosophy of Pyrrho and his followers is called Pyrrhonism, a name which, in subsequent times, has been applied to any kind of scepticism, though the Pyrrhonian philosophy in reality is only one particular and an elementary form of scepticism. Cicero, in several passages, speaks of the philosophy of Pyrrho as long exploded and extinct. Pyrrho himself is said by some antient authors to have left no works behind him; the tropes, or epochs, or fundamental principles of his philosophy, being justly ascribed to one or more of his followers. But Sextus Empiricus (*Adv. Math.*, i. 282) says that he wrote a poem addressed to Alexander the Great, for which he was richly rewarded: and Athenæus (x., p. 419) quotes a passage from a work of Pyrrho, the character of which is entirely unknown. The first writer on the scepticism of Pyrrho is said to have been Timon, his friend and disciple, whose life is written by Diogenes Laertius.

PYRRHOCERAS. [Corvidæ, vol. viii., p. 72.]

PY'RRHOCORAX. [Corvidæ, vol. viii., p. 72.]

PYRRHO'DES. [Psittacidæ.] Mr. Swainson's generic character is as follows:—

Bill and general structure as in *Lorius*. Tail cuneated, very long; the feathers narrow and pointed; the two middle pairs greatly exceeding the others.

Locality.—Indian Islands.

Example, *Pyrrhodes Papuensis*, Le Vaill., i., pl. 77.

PY'RRHULA. [Bullfinch.]

PYRRHULI'NÆ, Mr. Swainson's name for a subfamily of *Fringillidæ*, comprising the genera *Pyrrhulauda*, Smith; *Pyrrhula*, with subgenera *Crithagra* and *Spermophila*; *Psittirostra*; *Corythus*; *Hæmorhous*, Sw.; and *Loxia*, Linn.

PYRRHULAUDA. The following is the generic character:—

Bill short; the sides much compressed; the tip entire; the culmen arched; commissure straight. Nostrils concealed by the frontal feathers. Wings moderate; the first quill very small and spurious; the three next equal, and longest. Tail moderate, slightly forked. Feet black. Tarsi moderate. Toes very small. Lateral toes equal. Hinder claws lengthened, slightly curved. Smith. (Sw.)

Example, *Pyrrhulauda leucotis*, 'Pl. Col.' 269, f. 2.

PY'RRHUS, king of Epirus, born about the year 318 B.C., was the son of Aeacides and Phthia, daughter of Meno the Thessalian, who distinguished himself in the Lamian war. The fabulous genealogies of his family traced his origin back to Neoptolemus, whose father Achilles is said to have been honoured as a god by the Epirotæ under the name of Aspetus. Aeacides, who had come to the throne after the death of Alexander the Molossian, excited discontent among his subjects by his constant wars against the Macedonians, and was in the end driven out of his kingdom. (Justin, xvii. 3.) His only son Pyrrhus, then two years old, would have been put to death but for the care of a few friends, who, with the greatest difficulty, saved the child's life. Pyrrhus was carried to Glaucias, king of the Illyrians, whose wife belonged to the family of the Aeacidæ, and who received the infant prince, and had him educated with his own children. Great offers were made to Glaucias to induce him to surrender the child, but in vain. In his house Pyrrhus remained until his twelfth year. Aeacides, who had in the meanwhile returned to his country, fell in a battle against Cassander; and Glaucias now, with an armed force, led Pyrrhus back to Epirus, and the Epirotæ gladly received the young prince as their king. (Plut., *Pyrrh.*, 3; Justin, xvii. 3.) A regency was appointed, who governed the kingdom in his name. When Demetrius, the chief adversary of Cassander, was obliged to withdraw his forces from Europe to Asia, Cassander contrived to induce the Molossians to expel their king again. Pyrrhus, now seventeen years of age, joined Demetrius, who had married his sister Deidamia. In the battle of Ipsus (301 B.C.), which terminated so unhappily for Demetrius and his father, Pyrrhus gave the first proofs of his impetuous courage. After the battle he went over from Asia to Greece, and exerted himself to save the remains of the forces of Demetrius; and when Ptolemæus, king of Egypt, made peace with him, Pyrrhus went as a hostage to Alexandria. Here he soon won the affections and the esteem of Berenice, the king's favourite wife, who gave him her daughter Antigone, by her first husband Philip, in marriage, and seems to have prevailed upon Ptolemæus to provide her new son-in-law with a fleet and money, and to send him back to his kingdom. Pyrrhus, on his arrival, reconciled himself with Neoptolemus, whom the Molossians, during his absence, had raised to the throne, and agreed to share the government with him. Neoptolemus was of a savage and cruel temper; and he soon conceived such a jealousy and hatred of his colleague, that he even attempted the life of Pyrrhus, who, to secure himself, put Neoptolemus to death, 295 B.C. (Plut., *Pyrrh.*, 5.) From this time Velleius Paterculus (i. 1) dates the commencement of the reign of Pyrrhus. Soon after this event, Alexander, the younger son of Cassander, who had been expelled from Macedonia by his brother Antipater, sought the aid of Pyrrhus, which was granted on condition that Alexander should give up Tymphaea and Parauaea (Niebuhr, *Hist. of Rome*, iii., p. 536), together with Ambracia, Acarnania, and Amphilochia. Pyrrhus at the same time formed an alliance with the Ætolians, and was thus enabled to resist Demetrius, who, after having murdered Alexander, had become king of Macedonia (294 B.C.). Secret jealousy had long existed between Demetrius and Pyrrhus. After the death of Deidamia, Demetrius carried off Lanassa, the second wife of Pyrrhus, who brought to her new husband the island of Corcyra, which her father, Agathocles of Syracuse, had conquered. Upon this open war broke out between the two kings. Demetrius invaded Ætolia, where he made some conquests, but leaving Pantauchus behind with a considerable force, he directed his march against Pyrrhus, who at the same time was setting out to protect his allies. The two kings, having taken different roads, passed each other without being aware of it; and Pyrrhus entered Ætolia, while Demetrius ravaged Epirus. Pyrrhus met Pantauchus, and a great battle ensued. Pantauchus, who was by far the ablest general of Demetrius, challenged Pyrrhus to single combat, in which the Macedonian, after receiving two severe wounds, was conquered, but not killed, being snatched away by his friends. The Epirotæ, encouraged by the news of the victory which their heroic king had gained, slaughtered many of the Macedonians, made five thousand prisoners, and chased the rest out of their country.

Pyrrhus now invaded Macedonia, where he penetrated as far as Edessa, and was joyfully received by many Macedonians, who joined his army. Lysimachus at the same time made an attack on Macedonia from Thrace. The conduct of Pyrrhus during this expedition induced nearly the whole of the Macedonian army to desert Demetrius, and to salute Pyrrhus as king of Macedonia (287 B.C.). Demetrius fled into Asia, where he was defeated by the son of Lysimachus, and surrendered himself prisoner to Seleucus.

Lysimachus now claimed to share the conquest; and Pyrrhus, who did not think it safe to enter into a new contest with the aged general of Alexander, consented to divide Macedonia between himself and Lysimachus. But this division only gave rise to fresh disputes. Lysimachus soon began to feel that Pyrrhus was an obstacle to his ambition. (*Plut.*, *Pyrrh.*, 12.) The consequence was, that a few years after the division of Macedonia, when Demetrius was detained in Syria, Lysimachus, having now no other enemy to fear, attacked Pyrrhus in his portion of Macedonia. The Macedonians, perhaps bearing a grudge against Pyrrhus for having assisted in the division of their country, were easily persuaded to abandon the king of Epirus, who, without offering any resistance, withdrew his forces from the kingdom of Macedonia about 283 B.C. (Niebuhr, *Hist. of Rome*, iii., note, 813.)

Pyrrhus now enjoyed a few years of peace and happiness; but in 281 B.C. he was requested by the Tarentines to give them his assistance against the Romans. The Tarentines declared that they merely wanted a skilful general, that a sufficient number of soldiers would be raised in Italian Greece, as the Lucanians, Messapians, the Samnites, and they themselves, would furnish an army of 20,000 horse and 350,000 foot. These promises, and the hope of adding Italy and Sicily to his dominions, excited among the Epirots, no less than in Pyrrhus himself, so great a desire to enter this new field of action, that neither the wise remarks of the eloquent Cineas, nor the unfavourable season of the year, could prevent him from immediately setting out. Cineas was sent first with 3000 soldiers, and the king followed in Tarentine vessels of transport with an army of 3000 horse, 20,000 foot, 2000 bowmen, 500 slingers, and 20 elephants. (Plut., *Pyrrh.*, 15.) His son Ptolemaeus, by Antigone, then fifteen years of age, was left behind as guardian of the kingdom. (Justin., xviii. 1.) When the transports had reached the open sea, a tremendous storm arose. The king himself reached the Italian coast; but many of the ships were wrecked, and others effected their landing with great difficulty. Only a few horsemen escaped, and 2000 foot and two elephants were lost. With the remnant of his army Pyrrhus entered Tarentum. He soon discovered that the objects of these frivolous Greeks could not be attained, unless he assumed dictatorial power. He therefore shut up all their places of amusement, compelled all the men capable of bearing arms to serve as soldiers, and the younger to submit to regular military training in the gymnasia. The effeminate Greeks, who had not expected this, left their city in great numbers. The troops which had been promised by their allies did not arrive; the Lucanians and Samnites however were prevented from joining Pyrrhus by the Roman consuls. When the consul Laevinus entered Lucania with a numerous army, Pyrrhus provided for the security of Tarentum, and went out to meet the enemy. As he however wished to defer a decisive battle until the arrival of his Greek allies, he offered to act as mediator between the Greeks and Romans; but the haughty answer of Laevinus put a stop to all negotiation, and Pyrrhus pitched his camp on the north bank of the small river Siris, in the plain between Pandosia and Heraclea. The Romans, who were encamped on the south bank, were anxious to offer battle. The consul sent his cavalry across the river to attack the enemy's rear; but Pyrrhus discovered the movement, and, leading his own cavalry against them, the battle commenced. The king displayed the greatest activity, and was always in the midst of danger. His brilliant armour rendering him too conspicuous, he exchanged it for that of his friend Megacles, who, being taken for the king, was slain by a Roman. His armour was carried to Laevinus, who thought that the king himself had fallen. The battle lasted the whole day, and the Romans advanced and retreated seven times. The elephants were of great advantage to the Greeks; for as soon as the Roman cavalry perceived the huge animals advancing and opening the way for the Thessalian horse that formed part of the army of Pyrrhus, they fled back across the river. The infantry was involved in their flight, and the whole of the Roman army would perhaps have been destroyed, had not one elephant, growing faint from his wounds, stopped the pursuit. The remnants of the Roman army then escaped in the darkness of the night, and the enemy took possession of their camp. Pyrrhus, on the next day, visited the field of battle, buried the bodies of the slain enemies, amounting to 7000, as well as those of his own soldiers, and proposed to the Roman captives to serve in his army. They all refused; and Pyrrhus honoured their fidelity by sending 200 of them back to Rome. (Niebuhr, *Hist. of Rome*, iii., p. 559; Justin., xviii. 1.) Pyrrhus purchased this success with the flower of his own army, and he said that another such victory would compel him to return to Epirus.

The field of battle on the river Siris has latterly become a subject of great interest. In the year 1820 two bronzes of the most exquisite workmanship were found not far from the river, and near the site of the old town of Grumentum (now Saponara in the province of Basilicata), and within the enclosure of a ruin which has perhaps been a small temple. These bronzes, called the Bronzes of Siris, which were originally gilt, are each a little more than seven English inches in length. On each of them is represented in very high relief a hero fighting with an Amazon. They are now in the British Museum, and may at first sight be recognised as fragments of a magnificent cuirass. The character and the beautiful style of the work render it certain that they belonged to the school, or at least to the period, of Lysippus. They were in all probability brought over to the spot where they were found, by some one in the army of Pyrrhus, and may perhaps have formed part of the armour of the king himself or of one of his generals, though there is no evidence to prove this supposition. (Bröndsted, *The Bronzes of Siris*, an archaeological essay, London, 1836.)

After the battle on the Siris, Pyrrhus advanced to within 300 stadia of Rome, and was joined by the Lucanians and Samnites. The Romans, undaunted by their defeat, and deserted by many of their allies, raised new troops and determined to try their strength again. It was not the intention of Pyrrhus to conquer or destroy Rome, but to conclude an honourable peace, and accordingly he sent his friend Cineas to Rome to negotiate while he assembled his Italian allies. The conditions which he proposed were, according to the most probable account of Appian (iii. 10, 1), that peace should be concluded with himself and the Tarentines, that all Italian Greeks should be free, and that all conquests which the Romans had made in Lucania, Samnium, Daunia, and Bruttium, should be given up. At the same time he offered to deliver all the Roman captives without ransom. The senate of Rome hesitated, until Appius Claudius, the blind, threw all his influence into the scale, and persuaded his fellow-citizens to send Cineas out of the city and to break off all negotiations. Pyrrhus, seeing that there was no hope of peace with the Romans, advanced with his army as far as Anagnia, and seems even to have taken possession of Praeneste. (Flor., i. 18, 24; Eutrop., ii. 7.) He had ravaged all the country through which he had passed, and his soldiers, laden with booty, began to show great want of discipline. The Romans had now concluded a peace with the Etruscans; and the season of the year was too advanced to begin a new campaign: these circumstances combined to induce Pyrrhus to lead his troops back to Campania, where he found Laevinus with a numerous army. But neither of the two parties was anxious for battle, and Pyrrhus took up his winter-quarters at Tarentum. During the winter the Romans sent an embassy headed by C. Fabricius to negotiate for an exchange of prisoners. Pyrrhus refused the proposal, unless peace was concluded on the terms proposed by Cineas; but in order to show his esteem for the enemy, he allowed the prisoners to go to Rome for the purpose of celebrating the Saturnalia, on condition that if their fellow-citizens should not be willing to conclude peace, they should return after the festival. The senate would not hear of peace, and, after the festival was over, they sent the captives back to Pyrrhus. (Appian, iii. 10, 5; comp. Niebuhr, *Hist. of Rome*, iii., p. 580, &c.)

In 279 B.C., Pyrrhus began his new campaign, and in the neighbourhood of Asculum in Apulia he met the Roman consuls P. Sulpicius and P. Decius. The king compelled the Romans to come forward into the open field by sending his elephants with a division of light-armed troops to attack their flank. The Romans endeavoured in vain to break through the phalanx; Pyrrhus was irresistible, and the elephants dispersed and routed the Roman horse. The Romans, after having lost 6000 men, took refuge in their camp; Pyrrhus lost 3500 of his soldiers, and among them the flower of his army (Plut., *Pyrrh.*, 21; comp. Niebuhr's *Hist. of Rome*, iii., p. 589, &c.), and although he had gained the day, he retreated to Tarentum. He is said to have exclaimed, 'One more such battle, and we are lost.'

The Bronzes of Siris, drawn from the originals in the British Museum.

He had discovered how little he could rely on the discipline of his Italian allies; to draw reinforcements from Epirus was impracticable, as an insurrection had broken out among the Molossians (Appian, iii. 11, 1), while the northern part of Epirus was threatened with an invasion of the Gauls. The Romans, on the other hand, who seemed to gain new strength after every defeat, had formed a close defensive alliance with Carthage (Polyb., iii. 25), which immediately sent out a fleet to co-operate with the Romans against Pyrrhus. The Romans however declined this aid, and Mago, the Carthaginian admiral, sailed to Pyrrhus, who had already directed his attention to Sicily, to sound his intentions. In the meanwhile however an occurrence is said to have taken place which afforded to the Romans as well as to Pyrrhus a favourable opportunity to put a stop to hostilities. In the year 278 B.C., when the consuls C Fabricius and Q. Papus had taken the field against Pyrrhus, a traitor belonging to the retinue of the king proposed to the consuls to destroy his master by poison. The Romans are said to have apprised the king of his danger (Niebuhr, *Hist. of Rome*, iii., p. 594, &c.), who, as a reward for their honesty, ordered Cineas to lead all the Roman prisoners back, without ransom, and laden with rich presents. Cineas was also authorised to make peace. The generosity of the king rendered the Roman senate more flexible than before, and although peace was refused unless the king would consent to quit Italy, yet the Tarentine prisoners and other allies of Pyrrhus were sent back, and a truce was concluded (Appian, iii. 12, 1), which enabled the king to cross over to Sicily with his army. The garrison in Tarentum and other places remained, and Alexander, son of Pyrrhus by Lanassa, was entrusted with the command at Locri. (Justin, xviii. 2.) Pyrrhus had been invited by the inhabitants of Agrigentum, Syracuse, and Leontini to lend his aid against some Sicilian tyrants and the Carthaginians, who had already taken possession of many towns in the island and were besieging Syracuse by land and by sea. Pyrrhus willingly complied with their wish, hoping that it would not be difficult to make himself master of the island, and thus more effectually to support his Italian allies.

After having spent two years and four months in Italy (Diodor., *Fragm.*, lib. xxii. 11), Pyrrhus landed with his army in Sicily. The Carthaginians withdrew their forces from Syracuse. Almost all the towns of Sicily threw open their gates to him; Eryx was besieged and soon reduced. The Mamertines, who held several towns in subjugation, and exacted heavy tributes, were likewise subdued. The Carthaginians were at last driven from Sicily, with the exception of Lilybæum, where they fortified themselves, and were besieged by Pyrrhus. They were willing to give up the whole island, with the exception of this last stronghold, and even offered money if Pyrrhus would conclude peace on these terms. But Pyrrhus, urged by the chief Sicilians, whom nothing short of an entire evacuation of their island by the Carthaginians would satisfy, declared that he could enter into no negotiation unless they would withdraw all their forces from Sicily. (Diodor., *Fragm.*, lib. xxii. 14.) After a long and useless siege of Lilybæum, the king determined to man his fleet and make a landing on the coast of Africa. But his severity in compelling the Sicilian Greeks to man his vessels, and his mistrust of them, roused their discontent. The two leading men among them, Thynon and Sosistratus, incurred his suspicions, and one of them was put to death. This act suddenly called forth the hatred of the Sicilians, and some of them threw themselves again under the protection of the Carthaginians, while others called the Mamertines to their assistance. While this dangerous spirit was spreading in Sicily, Pyrrhus received information that the Tarentines and Samnites were no longer able to hold out against the Romans, and he gladly seized this opportunity of quitting the island, and hastened to Italy.

In his passage through the straits he was attacked by the Carthaginian fleet, and lost seventy of his ships, and reached the coast of Italy with only twelve which were in sailing condition (276 B.C.). On arriving at Locri, he found himself in great difficulties, not being able to pay his soldiers. To satisfy their wants, he took the sacred treasures from the temple of Proserpine. When the treasures were embarked, a storm arose, in which some of the ships were

5.), the ships, laden with the treasures, were cast back on the coast of Locri.

Pyrrhus, whose mind seems to have lost its former energy and self-possession, fancied that he had incurred the anger of the goddess, and not only restored all the treasures to the temple, but endeavoured to atone for his crime by offering rich sacrifices; and as the signs appeared to be inauspicious, he put to death all those who had advised or consented to the sacrilegious act. (Appian, iii. 12.) On his march towards Tarentum his army was attacked and harassed from the mountainous districts by numbers of Mamertines, who had come over from Sicily before him. Pyrrhus here again evinced his usual courage. A huge barbarian challenged the king to single combat, and Pyrrhus, though already wounded, hurried forward, and cut the man in two with his sword. This proof of his undaunted spirit put an end to the attacks of the barbarians, and he reached Tarentum in safety.

Having here reinforced himself, he set out against the Romans, and pitched his camp in Samnium. The Romans sent out two consular armies, under Manius Curius, who marched into Samnium to meet Pyrrhus, and L. Cornelius Lentulus, who took up his position in Lucania (275 B.C.). The Samnites sent a contingent to his army, but it was small, as they bore some ill will towards him. Pyrrhus sent a part of his army to Lucania, to prevent Lentulus joining his colleague. Curius had taken his position, and fortified himself on the hills near Beneventum, wishing to avoid battle until the arrival of Lentulus. It was the intention of Pyrrhus to attack the Roman camp by surprise before daybreak, but in order to reach the summit of the hill above the Roman camp, he had to lead his army a long and fatiguing way through the forests, and when he descended upon the Roman camp it was broad day-light. Curius turned round to attack the enemy, who after some resistance took to flight. This success emboldened Curius to direct his attack against the main army of the king in the plain. The elephants, frightened and infuriated by burning arrows, which the Romans showered on them, put the king's army into disorder, and were thus the cause of a complete defeat. The king's camp fell into the hands of the Romans. Two elephants were killed and eight taken; Pyrrhus himself, with only a few horsemen, escaped to Tarentum. He nevertheless did not despair, but sent letters to several kings, requesting them to supply him with men and money. (Paus., i. 13.) Antiochus promised to comply with his wish, but Antigonus refused. A report of advancing succours for the king kept the Romans at a distance, and enabled Pyrrhus to set sail for Epirus with the greater part of his troops. Milo however was left behind, with the command of the garrison at Tarentum, and his son Helenus.

On arriving in his kingdom, Pyrrhus found himself unable to provide for the wants of his small band, and after some Galatians had joined him, he invaded Macedonia in order to gain by plunder the means of maintaining his troops. Fortune once more favoured him, and he soon made himself master of nearly the whole of Macedonia. Thinking that a more glorious field was now opening to him, he gave up all intention of returning to Italy, and recalled Milo and his son Helenus. Antigonus, who had assembled an army of Gallican mercenaries, was defeated by a son of Pyrrhus, and fled from his kingdom.

Before Pyrrhus had firmly established himself in Macedonia, he was invited by Cleonymus, a worthless Spartan, to assist him against the king Areus. Pyrrhus advanced to Sparta with a numerous army, ravaging and plundering the neighbourhood. Though king Areus was absent, Pyrrhus met with a most determined resistance from the women as well as the men of Sparta, and his son Ptolemaeus, who had made his way into the city, was nearly killed. Pyrrhus himself had a severe contest at the gates of the city, which was interrupted by night, and recommenced the next morning. He succeeded in forcing his way into the city, but the united exertions of the Spartan men and women drove him from it. At the same time king Areus arrived from Crete, and auxiliaries from Corinth were on their march to Sparta, and Pyrrhus therefore gave up the contest, and contented himself with ravaging the country. He intended to take up his winter-quarters in Laconia, but another opportunity for action offered itself. Argos was distracted by two factions: one was headed by Aristeas, who called Pyrrhus to his assistance, while Aristippus, his adversary, sought the protection of Antigonus. The king immediately marched towards Argos. On his road he was attacked by Areus, who lay in ambush and cut off the rear of his army. Pyrrhus left Ptolemaeus behind to oppose Areus, and proceeded on his road. His son fell in a fierce battle, and Pyrrhus, turning back to avenge his death, slew with his own hand Eualcus, who had killed his son.

In the meanwhile Antigonus had occupied the hills near Nauplia, and Pyrrhus pitched his camp in the plain. The Argives, dreading the issue of a battle, promised that their city should not be hostile to either party, if they would not attack it. Antigonus consented, and gave his son as a hostage. Pyrrhus likewise promised to keep peace, but gave no pledge of his intentions. In the ensuing night Aristeas opened one of the gates to him, through which Pyrrhus with his Galatians entered, and took possession of the market-place. The Argives, roused from their sleep by the noise, sent to Antigonus, who immediately advanced with his forces. Areus at the same time arrived with a select body of Cretans and Spartans. The darkness of the night and the narrowness of the streets produced the greatest confusion among the combatants. At daybreak, Pyrrhus, discovering that all the fortified parts of the city were occupied by armed troops, wished to get out of Argos. While he was making this attempt, assisted by one of his sons, he was killed by an old woman, who, seeing her son fighting with the king, threw a tile upon his head from the roof of her house.

Pyrrhus died in the year 272 B.C. (Niebuhr, *Hist. of Rome*, iii., note, 928.) All the ancients agree that he was one of the greatest generals; and Hannibal himself declared him to be the first. But great as he was in battle, he did not know how to make the best use of a victory. His ambition was rather to acquire than to preserve, and he generally soon lost the advantages which he had gained. He was grateful towards his subjects, and owned that he was indebted to them for all that he possessed. As a man, he stands pre-eminent among the kings of his time; for while they were surrounded by worthless flatterers, Pyrrhus had friends such as few kings have ever possessed. In his family he was an affectionate father and husband. A change seems to have taken place in his character from the time when he embarked for Sicily, and no blame can be attached to his conduct previous to that event. The death of Neoptolemus was a mere act of self-defence, but his conduct towards Sparta has left a stain upon his character. Pyrrhus also attempted to distinguish himself as an author (Cic., *Ad Famil.*, ix. 25; Plut., *Pyrrh.*, 21); but we have no means of judging of his merits in this respect, as no part of his work remains. The Life of Pyrrhus by Plutarch is one of the most exquisite specimens of biography.

Coin of Pyrrhus.

British Museum. Actual size. Silver. The head is probably that of Jupiter.

PY'RULA. [SIPHONOSTOMATA.]

PYRUS, the Latin word for 'pear-tree,' is a name now given by botanists to a considerable number of Rosaceous plants, whose collective character is to bear a fruit resembling in all essential circumstances that of the apple or pear; that is to say, inferior, fleshy, with a cartilaginous lining to the cells, which are simple, and contain from 1 to 2 seeds in each. But the similarity in the fruit is by no means accompanied by an equal degree of resemblance in the foliage and manner of growth of the species, some of them being trees with the aspect of the apple and pear, while others have pinnated leaves which have caused them to be vulgarly regarded as species of ash, and many are dwarfish shrubs, with quite a peculiar appearance.

In consequence of such differences the genus is divided into several sections, the most important of which are,—1, the Apples and Pears, with oval simple leaves, and the stature of trees; 2, the Beam-trees, with coarsely toothed leaves white with down beneath; 3, the Mountain Ashes, with pinnated or pinnatifid leaves; and 4, the Dwarf Crabs, with oval simple leaves, and the stature of bushes. Upon each of these it is necessary to state something.

To the section of apples and pears belong not only the well-known fruits so called [APPLE; PEAR] and all their many varieties, but also several species whose fruit is less valuable. On Mount Sinai grows a species called *P. Sinaica*, whose fruit is hard, gritty, and austere, and whose leaves are grey with down; in Germany a similar kind, the *P. nivalis*, is by no means uncommon, with a considerable resemblance to the last; Siberia and Persia produce another, called *P. salicifolia*, with very narrow hoary leaves; and in the former country are found the Siberian crab, *P. prunifolia*, and the berry-fruited crab, *P. baccata*, whose fruit is too small for ordinary consumption, but is often seen in the form of a sweetmeat. Besides these, the Chinese crab, *P. spectabilis*, and also *P. coronaria*, are cultivated for their flowers.

The Beam-trees derive their name from the use that has been made of their tough wood for beams, axletrees, and similar purposes, where great strength is required. It is especially for the cogs in the wheels of machinery that it was used, till superseded by iron. The common Beam-tree is *Pyrus Aria*, and inhabits the rocks of the west and north of England, where it forms an ornamental object with its dark-green foliage shifting to silvery-white when disturbed by the wind. To this section may be referred without inconvenience the true Service, *Pyrus domestica*, a tree now not uncommon in England, but originally from the south of Europe, with a large pyramidal head, coarsely serrated leaves, and a green austere fruit, which however blets like the medlar, when it becomes tolerably eatable, though very indigestible. Its wood is very compact, and is said to be the hardest and heaviest of any indigenous in Europe.

The mountain ash, *P. aucuparia*, is a well-known ornamental tree, with a graceful habit, fragrant clusters of white flowers, and loose bunches of scarlet berries. It is found wild all over Europe and in the north of Asia; a variety occurs with yellow berries. In North America it is represented by a nearly allied species, *P. Americana*, with large copper-coloured berries, and a third kind, *P. microcarpa*, with very small scarlet fruit. The mountain ash is the rowen-tree of the Scotch, whose boughs were supposed to be a protection against witchcraft. It forms a hardy and good stock on which to graft the pear-tree, when it is desired to dwarf that species.

The dwarf crabs are small bushes with dense clusters of white flowers succeeded by black or red fruit very like that of the mountain ash. All are North American, except a Swiss species, *P. chamæmespilus*, and are scarcely cultivated except as objects of curiosity.

(See Loudon's *Arboretum Britannicum*, vol. ii., p. 917, &c., for very copious information concerning this genus.)

PYTHA'GORAS, the son of Mnesarchus, was born about the year 570 B.C., in the island of Samos. By his mother's side he was connected with the most distinguished families of the island; his father, according to most accounts, was not of pure Greek blood, but either a Phœnician or a Tyrrhenian of Lemnos or Imbros. The history of Pythagoras is obscured and disfigured by a cloud of fables, through which we are unable to discover anything beyond the most general outline of the chief events of his life and his character. He is said to have been a disciple of Pherecydes of Syros; and if we could give credit to the various other traditions respecting his masters, he would appear to have been connected with almost all the philosophers of the age, from Thales and Anaximander down to the obscure Creophilus and Hermodamas. (Porphyr., *De Vit. Pythag.*, 2; Diog. Laert., viii. 2.) But the information which he derived from his countrymen did not satisfy his inquisitive mind, and, like many other illustrious Greeks, he travelled into various countries. He first visited Egypt, where he was introduced to King Amasis by letters from Polycrates. From Egypt he went to Asia, where he is said to have made himself acquainted with the science of the Chaldæans and the Magi: some traditions even state that he visited India and the Gymnosophists. But though these traditions may have some historical foundation, thus much is certain, that his philosophical system was not derived from any foreign source, or even materially influenced by anything that he saw and learned in the countries which he visited. All that he derived from foreign countries cannot have been more than general impressions which their political and religious institutions made upon him, and which may in some measure have decided the natural bias of his mind. His whole philosophy bears the impress of genuine Greek growth, and there is scarcely anything in it which may not be traced to some native source. On his return from his travels, he seems to have conceived the plan which he afterwards endeavoured to realize; but finding that the tyranny which Polycrates had established in his native island would be an insurmountable obstacle to his views, he set out in search of a new home. After having travelled through several parts of Greece, partly to strengthen himself in his opinions, for which purpose he perhaps visited Crete and Sparta; partly to form useful connections, as at Olympia and Delphi; partly also to sound the minds of the people, and to discover how far they might be disposed to carry his designs into effect, he finally settled at Croton in Southern Italy. The aristocratical government and the state of parties in this city seem to have been particularly favourable to the realization of his political and philosophical schemes, and the place was therefore certainly not chosen by the philosopher without due consideration. The fame of his wisdom and of his travels had probably gone before him to the Italian Greeks. The aristocratical party at Croton, who were in possession of all the political power, had excited discontent among the people; and though still strong enough to maintain their position against the commonalty, they must have hailed the arrival of a stranger, who, being supposed to be endowed with supernatural powers, commanded the veneration of the multitude, and was willing to serve the oligarchs on condition that they would allow him some degree of influence in their political measures.

From the moment of his favourable reception by the senate of Croton, whose object seems to have been to use him as an instrument for their own ends, a new æra in the life of Pythagoras commences; but before we proceed to consider the manner in which he endeavoured to put his theory into practice, we shall attempt to give a brief outline of his philosophical principles, which will serve to throw some light upon his institution, which we shall describe hereafter. The philosophic school of which Pythagoras was the founder, is sometimes called the Italian or the Doric school. The latter name seems to have been given to it, not so much because it was peculiar to the Doric race, or because its object was to establish the ideal of a Doric state (Müller, *Dor.*, iii. 9, § 15), but because it was neither connected with the Ionian nor the Attic school; though, on the other hand, it must be admitted that the institutions which Pythagoras established at Croton, in many respects bore great analogy to the Doric institutions which he had seen in Crete and Sparta. It is the more difficult to give a clear idea of the philosophy of Pythagoras, as it is almost certain that he himself never committed it to writing, and that it has been disfigured by the fantastic dreams and chimæras of later Pythagoreans. In modern times great light has been thrown upon the subject by the careful examination and analysis of the fragments of Philolaus by Boeckh (*Philolaus des Pythagoreers Lehren nebst den Bruchstücken seines Werkes*, Berlin, 1819). Philolaus of Tarentum, a disciple of Pythagoras himself, was in all probability the first Pythagorean who wrote an exposition of the system of his master, and his fragments must therefore be considered as the most genuine source of information. The results at which Boeckh arrived, are on the whole the same as those which Ritter, in his 'Geschichte der Pythagorischen Philosophie' (Hamb., 1826) subsequently reached, though by a different mode of inquiry. Pythagoras considered numbers as the essence and the principle of all things, and attributed to them a real and distinct existence, so that in his view they were the elements out of which the universe was constructed. How he conceived this process, has never yet been satisfactorily explained; but he was probably led to the supposition by observing that the periodical occurrences in nature, and almost all institutions and religious regulations and observances in Greece, were founded on numerical relations. Pythagoras thus traced the various forms and phenomena of the world to numbers as their basis and essence. But he did not stop here: he ascended still further to the principles of numbers themselves: these principles he conceived in the form of contrasting pairs, such as straight and curve, limited and unlimited, one and many, odd and even, and others. (Aristot., *Metaph.*, i. 5.) Further, he traced these contrasts to one first principle and element, the unit (μονάς), which included both the even and the odd, &c., and thus the even was odd. This unit he considered as the formal as well as material basis of all things, and as identical with the one supreme being, or God. The decad and tetractys or the quadrate are likewise described as perfect numbers and first principles; the triad was called the number of the whole, because it had a beginning, middle, and end. Pythagoras conceived the vital process of the world as a process of breathing, and the first principle was therefore likewise a breathing being, which inhaled the infinite atmosphere of the world (ἄπειρον πνεῦμα), and thus partook of its infinity and became capable of developing itself into a multiplicity of numbers or things. The perfect development of the original unit is represented in our actual world, which consists of small and large wholes in the greatest variety. The special principle of every single whole or organization is again a unit, or a point separating itself from the rest; and as it is a living germ, it develops itself by breathing the ἄπειρον πνεῦμα into a distinct body of peculiar form and proportion. Every abstract idea was thus in reality a number, and physical objects were symbolical representations of numbers. In the world which had thus arisen out of a union between the even and odd, &c., the Pythagoreans distinguished five elements,—fire, air, water, earth, and the so-called fifth element (τὸ πέμπτον στοιχεῖον), which was probably the aether. In the centre of the universe they placed the central fire (ἑστία τοῦ παντός), as it were, the altar of the universe, the principle of life in the world. The central fire is surrounded by the earth, the moon, the sun, the five planets, and the firmament, all of which were either gods themselves or inhabited by gods inferior to the supreme God who ruled the whole. The universe was divided, according to Philolaus, into three regions (διαστήματα). The first was the sublunary region, between the earth and the moon, the scene of change and passing events, where beings come into existence and perish again; it was called the heaven (οὐρανός). The second region was the region from the moon upwards to the firmament, and bore the name of kosmos (κόσμος). The third, or the firmament itself, called Olympus, was probably, in accordance with the national and traditional belief of the Greeks, considered as the abode of the gods. The heavenly bodies, together with the gods themselves, were conceived as performing a choral dance round the central fire, whence the music or the harmony of the spheres.

Advancing from the consideration of the universe to man, the Pythagoreans represented the souls of men as light particles of the universal soul diffused through the whole world (Cic., *De Nat. Deor.*, i. 11); the souls of the gods were considered as proceeding directly from the central fire, which was on this account designated 'mother of the gods,' while the souls of men proceeded from the sun, which was a mere reflex of the central fire. The soul of man was divided into three parts, νοῦς, φρένες, and θυμός: the two former were considered as the rational half of the soul and had their seat in the brain; the last, or θυμός, was the animal half, and its seat was in the heart. (Diog. Laert., viii. 19, 30; Plut., *De Plac. Phil.*, iv. 5.)

The doctrine of the transmigration of souls does not seem to have originated among the ancient Greeks, for they describe the souls of the departed as dwelling in the lower world, from which there was generally no return. Pythagoras may have derived it from some of the mysteries, for he is said to have been initiated in all the existing mysteries both of Greece and other countries. He and his followers considered the transmigration of souls as a kind of purifying process. The souls, previous to their entering into human bodies, floated in the air, from whence they were inhaled by the process of breathing at the moment of birth. At the moment of death, they descended into the lower world, where they were probably supposed to dwell a certain number of years, after which they again rose into the upper world, and floated in the air until they entered into new bodies. When by this process their purification had become complete, the souls were raised to higher regions, where they continued to exist, and to enjoy the presence and company of the gods.

The Pythagoreans, according to Aristotle (*Eth. Magn.*, i. 1), were the first who determined anything in moral philosophy. Their ethics are of the loftiest and most spiritual description. Virtue was with them a harmony, unity, and an endeavour to resemble the deity. The whole life of man should be an attempt to represent on earth the beauty and harmony displayed in the order of the universe. The mind should have the body and the passions under perfect control; the gods should be worshipped by simple purifications, offerings, and, above all, by sincerity and purity of the heart. Besides the works of Ritter and Brandis referred to above, compare Ritter's 'History of Ancient Philosophy,' i., p. 327, 329, Engl. transl.

After this brief sketch of the philosophy of Pythagoras, we shall proceed to consider the manner in which he endeavoured to apply it, or at least its ethical part, to the affairs of ordinary life, which will at the same time show the onesidedness of a view which might be derived from a statement of Cicero and Diogenes Laertius. Both of these authors say that Pythagoras was the first Greek who assumed the title of philosopher, and that he compared his position to that of a spectator at the public games. The definition implied in this comparison is only applicable to a small portion of the philosophy of Pythagoras, for he manifestly did not consider mere contemplation as the sole and highest object of man, but it was his doctrine that by action as well as by thought the individual as well as the state should represent in themselves an image of the order and harmony by which the world was sustained and regulated.

The precise objects of his institutions at Croton are not quite clear, though we cannot suppose that they were either exclusively philosophical, religious, or political. The perfect state of society, such as he conceived it, depended as much on sound religious and philosophical, as on political principles. It was not his intention to bring about his reforms at once by force or by the introduction of a new code of laws, but by gradually diffusing his enlightened ideas. He seems never to have filled any public office at Croton, and perhaps he may have declined such places in order that he might not be checked in his designs by any of the existing institutions, which he could only have overthrown by force. His scheme, though in its objects similar to some of modern times, was not near so visionary and so extravagant; for that it was by no means impossible to give a new form to society is clear from the reforms wrought by Lycurgus at Sparta, of Zaleucus at Locri, and of Charondas at Catana. Pythagoras established at Croton a society or an order, of which he himself was the head, and which was to be the centre from whence his reforms were to emanate. It consisted of three hundred young men, selected from the most distinguished families of Croton and other Italian cities. The society was, as a modern historian expresses it, 'at once a philosophical school, a religious brotherhood, and a political association.' The earnestness and honesty with which Pythagoras went to work are apparent from the fact that he admitted none but the ablest men into his society, and that he bestowed the most anxious care on the cultivation of their minds and hearts, in order to render them alive to the highest objects that can engage the human mind, and to make them clearly understand the place which they occupied in the world. The proceedings of the society were transacted in the greatest secrecy, but perhaps more on account of the religious doctrines there inculcated than on account of either philosophical or political principles. Religion indeed seems to have been the foundation of the society, and that his religious principles greatly differed from those generally received is clear from the tenour of his system, and it is expressly stated that he censured Homer and Hesiod for their profane descriptions of the gods. (Diog. Laert., viii. 19.) Outwardly however he showed great respect for the objects of the popular worship—a prudence which, together with his dignified and priestly appearance, was well calculated to win the affections and the admiration of the people, while the purer doctrines which he imparted to his disciples secured their most perfect submission. He instituted among his disciples a secret worship, or mysteries, which are sometimes called Pythagorean orgies, and the science of numbers, geometry, and music; and even medicine and gymnastics, including dancing, were closely connected with the sacred rites. Women seem also to have been admitted, if not into the society, at least to some of the lessons of the philosopher. (Diog. Laert., viii. 21.)

As to the political character of the institution, from which we must derive our conclusions respecting his political views in general, it is expressly stated that it was aristocratical, but in the original sense of the term, in which it means the government of the wisest and the best. His object was to establish a rational supremacy of minds enlightened by philosophy and purified by religion; and as such a state of things did not exist in Greece, we can scarcely say that he preferred any one form of government to another for its intrinsic merits, but only in as far as he thought the one a more suitable basis for his own institutions than another. That an aristocracy probably in this point of view appeared to him preferable, is apparent from the fact that he is said to have thrown his influence into the scale in order to restore this form of government in some Italian cities, where it had given way to tyranny or democracy. The three hundred members of the society were the model of an aristocratical senate, such as he would perhaps have wished to establish in every republic. We have no ground for believing that they possessed any legal authority at Croton, or superseded the old senate of the Thousand, as Niebuhr seems to think (*Hist. of Rome*, i., p. 160), for the Three Hundred included many who were not even citizens of Croton.

Those who wished to become members of the society underwent an examination by Pythagoras himself, who is said to have been skilful in judging of persons by their physiognomy. (Gellius, i. 9.) Those whom he thought fit to be received were then submitted to a period of regular probation and discipline. For a time, at least for two years, they were forbidden to speak. During this first stage of their noviciate they bore the name of Acoustici (hearers). During the second period they were allowed to ask questions, and to make objections to what they heard, as well as to write about what they had learnt during the first period. They were now called Mathematici, or scholars, for their instruction was not confined to what we call mathematics, but included music and gymnastics, in short everything which could be learnt. In the third stage, when they received the name Physici, they were admitted to the last secrets in religion as well as in philosophy and politics. Another division of his disciples which is frequently mentioned, was that of Esoteric and Exoteric, and it can scarcely be doubted that the former of these names had reference to the three hundred, from whom no kind of knowledge which their master could impart was kept secret, while the name Exoteric was either applied to those who were passing through the first stages of their noviciate, or, what is more probable, to a much greater number of persons, who were not initiated into all the secrets which the master had to unfold, and perhaps received no instruction of a purely religious nature. The real character of some other divisions mentioned by the antients—for instance, Pythagorici, Pythagorei, and Pythagoristae, or Sebastici, Politici, and Mathematici—is matter of great difficulty, though it is not improbable that they may have been expressive of gradations similar to those described above. All candidates on entering upon their noviciate had to exchange their former mode of life for one which was regulated even to the most minute details by Pythagoras himself. Their diet seems to have been a subject of his especial attention, though the extant accounts of the restrictions under which he is said to have placed them are contradictory and incredible. The doctrine of the transmigration of souls may however have led him to enjoin abstinence from animal food. Many of these regulations respecting the diet and the whole mode of life of his disciples had probably a symbolical meaning, and were intended to impress upon their minds certain philosophical or religious principles. In its external arrangements the society of Pythagoras presents some analogy to the institutions which he had seen in Crete and Sparta. The members lived and took their meals together, and the union and attachment among them are said to have been so strong as to excite the jealousy of their relations. Conscientiousness and uprightness in all the affairs of life were points on which the philosopher laid great stress. (Iambl., *De Vit. Pyth.*, 144.)

The overwhelming influence which Pythagoras and his order had gradually acquired in Croton and other Italian towns where branch institutions of that at Croton seem to have been established, at first induced the aristocratical party of Croton to avail themselves of his services (Valer. Max., viii. 15, Ext. 1), but at the same time could not fail in the end to excite their jealousy. If on the other hand we consider that his interference in the affairs of the government must at all times have been viewed with dissatisfaction by the popular party, we see at once the weak basis on which his institution rested, and one great shock was sufficient to overthrow it. This shock arose out of a contest between the popular and aristocratical parties in the neighbouring town of Sybaris. Several exiles belonging to the latter party had taken refuge at Croton, and when the Sybarites required them to be surrendered, Pythagoras and his associates prevailed on the senate to reject the demand. A war broke out, which ended in the total destruction of Sybaris, 510 B.C. The senate of Croton and the Pythagoreans seem to have been elated by this victory, and refused to share the spoil and the conquered land with the people (Iambl., *De Vit. Pyth.*, 255), and it may have been about this time that the Pythagoreans, with overweening confidence in their own strength and that of the aristocracy, made the attempt to abolish the popular assembly. Such proceedings however, instead of intimidating the people, roused their indignation. A tumult broke out, in which the house of Milo, where the Pythagoreans were assembled, was burnt: many of them perished in the flames, and the rest saved their lives only by going into exile. Pythagoras himself seems to have been absent from Croton during the insurrection, and is supposed to have died a short time after at Metapontum (about 504 B.C.). Similar insurrections soon followed in several other towns of Italy, where branches of the Pythagorean society had been established. Some Pythagoreans, such as Philolaus, fled to Greece, where they taught their doctrines and had considerable influence on the philosophy of Plato. The Pythagorean system was revived at a later period, and in the second century of our æra it appeared mixed up with the doctrines of the New Platonists. (Krische, *De Societatis à Pythagora in urbe Crotoniatarum conditae Scopo Politico*, Göttingen, 1831.)

Various discoveries in mathematics, music, and astronomy are ascribed to Pythagoras, but it would be difficult to establish the truth of these traditions by historical evidence. We have not thought it worth while to repeat the monstrous mass of fables and miracles which are interwoven in the biographies of Diogenes Laertius, Porphyrius, and Iamblichus. It may safely be said that the history of no antient sage is so obscured by fables as that of Pythagoras. He himself may, by his own priestly appearance and conduct, and by the secret proceedings of his society, have given rise to them, and may even have encouraged the general opinion that he was endowed with supernatural powers; but on the whole these are mere symptoms of the mighty impression which he made on his contemporaries, as well as on subsequent ages, for such an impression is the most fruitful source of marvellous stories of every description.

PY'THEAS, a celebrated navigator, was a native of the Greek colony of Massilia. He flourished, according to some authors (Bougainville, *Mémoires de l'Acad. des Inscrip.*, tom. xix.), before Aristotle; but according to others, in the reign of Ptolemæus Philadelphus. Respecting the circumstances of his life nothing is known. Polybius, who disbelieved the accounts of his voyages, calls him a poor man, who could not possibly have undertaken such long journeys by land and voyages by sea. (Polyb., *Reliq.*, lib. xxxiv.) From the same source we learn that he is said to have made two voyages. In the first he sailed round the western coast of Europe and through the English Channel as far as Thule, which is generally supposed to be Iceland. This voyage he described in a work called a 'Description of the Ocean' (περὶ Ὠκεάνου), where, among other things, he stated that he had landed in Britain and travelled through it, as far as it was accessible, and that its circumference amounted to upwards of 40,000 stadia. Respecting the land of Thule, he said that there was neither land, nor sea, nor air, but something composed of all of them, in substance like that of the mollusca, in which the earth, the sea, and the whole universe were suspended. This substance, which he had seen himself, was, as he had been told, a connecting link of the universe, and it was impossible to penetrate into it either by land or by sea. (Strab., ii. 5, p. 181, ed. Tauchnitz.) This fabulous account of Thule may be easily explained; and that he advanced at least as far as Iceland seems to be clear from his statement that during the summer solstice in Thule the sun never disappeared from the horizon. (Plin., *Hist. Nat.*, ii. 75.) He places Thule six days' sail from Britain. Some time after his return, he set out on a second voyage, in which he sailed along the whole western coast of Europe, from Cadiz into the Baltic as far as a river which he called Tanais, on the banks of which amber was found. (Plin., *Hist. Nat.*, xxxvii. 2.) What river the Tanais may have been is uncertain. D'Anville and Gosselin denied the second voyage of Pytheas altogether, though the words of Polybius admit of no doubt that there was in his time a report of such a voyage, probably founded on the assertion of Pytheas himself. It is said to have been described in a work called Periodus or Periplus.

The motives for his undertaking such long voyages are entirely unknown, but it is generally supposed that the Massilians, a flourishing commercial republic, wishing to extend their mercantile connections, sent him out to explore the unknown regions of the north. In this case however the epithet *poor*, which Polybius gives to Pytheas, would be ill applied, as his personal poverty would have been no obstacle to his entering upon such bold enterprises. Pytheas also distinguished himself as a mathematician and an astronomer, and among other discoveries ascribed to him, he is said to have been the first who determined the meridian altitude of the sun at the summer solstice at Massilia, by means of a gnomon. (Hipparchus ap. *Strab.*, ii. 5, p. 182, ed. Tauchnitz.)

His merits have been differently judged of by the ancients, for while Eratosthenes and others adopted his statements in preference to those of others, Polybius (*Hist.*, iii. xxxiv., 10), and especially Strabo (in many passages of lib. i. and ii.), treat him with the utmost contempt, though the latter does not despise his accounts of the manners and productions of the countries which he visited. Modern geographers however have discovered reasons for judging more favourably of Pytheas, and have ascertained that he is right in several points for which he is censured by Strabo.

The few fragments of his works were collected and edited in 1824 by Andr. Arw. Arwedson, Upsala. Compare Brückner, 'Historia Reipublicae Massiliensium,' Göttingen, 1826, p. 64, &c.; 'Pythéas de Marseille et la Géographie de son Temps; ouvrage publié par Jos. Straszewicz, orné de trois Cartes géographiques,' Paris, 1836 (this work has been translated into German by S. F. W. Hoffmann, Leipzig, 1838). See also Ukert, *Bemerkungen über Pytheas*, *Geographie der Griechen und Römer*.

PYTHIA. [DELPHI.]

PYTHIAN GAMES (*Pythia*, or *Pythici Ludi*), one of the four great national festivals of the Greeks, were celebrated near Delphi, in honour of Apollo, originally every ninth year, and afterwards every fifth year, in the autumn of the third year of each Olympiad, in the second or third month of the year, according to Clinton. Corsini and others, followed by Boeckh, place them in the spring, in the month Munychion, the tenth of the year. Their origin is ascribed by some to Amphictyon, the son of Deucalion, or to the Amphictyonic council; by others to Agamemnon; by Pausanias to Diomed; by Strabo to the Delphians, after the Crissaean war; but most commonly to Apollo, after he had vanquished the serpent Python. (Ovid, *Met.*, i. 445.) There is an account that the gods and heroes contended in the first celebration of these games, when Castor conquered in the horse-race, Pollux in boxing, Calais in the foot-race, Zetes in fighting in armour, Peleus in throwing the quoit, Telamon in wrestling, and Hercules in the pancratium. But the fact seems to be, as stated by Pausanias (x. 7, 2) and Strabo (ix., p. 421), that the contest was originally in music: the singers (*ᾠδοί*) were to sing a hymn in honour of Apollo, celebrating his victory over the Python; and the instrument used was the lyre. In the third year of the 48th Olympiad (B.C. 586), at the close of the Crissaean war, the Amphictyons added a contest on the flute, which was afterwards discontinued, as the music of the flute was considered too mournful for a joyous festival. In the same year the Amphictyons also introduced athletic contests and races (but not with four-horsed chariots, the foot-race being confined to boys), and the games, according to Strabo, were then for the first time called *Pythia*; at all events the subsequent *Pythiads* are computed from this year by Pausanias and the Parian marble, though the scholiast on Pindar and Eusebius date them from the second celebration, in Ol. 49, 3. Boeckh and Clinton prefer the former date. Chariot-races were added in the time of Cleisthenes, the tyrant of Sicyon. The prize in the Pythian games was originally of silver or gold, or something else of intrinsic value; but afterwards a crown of laurel, or (according to Ovid, *Met.*, i. 449-50) at first, of the bay-oak or beech-tree (*aesculus*), for which the laurel was afterwards substituted. The ceremonies observed at these games, in common with the three other great festivals, are described under OLYMPIAN GAMES.

(Pausanias, x. 7; Strabo, ix., p. 421; Potter's *Archaeologia Graeca*, vol. i., c. 25; Wachsmuth, *Hellenische Alterthumskunde*, ii. (iv.), p. 378; Clinton, *Fast. Hellen.*, i., p. 228; [illegible])

PYTHON, M. Daudin's name for the great constricting serpents of the Old World.

In the article *Boa* will be found much relating to *Python*: the organization of both is so similar, that a repetition becomes needless. Like the *Boas*, the *Pythons* have processes or hooks near the anus, and narrow ventral plates, and indeed the latter can hardly be said to differ from the former except in the double plates beneath the tail. Their head has plates on the end of the muzzle, and there are fossets on their lips.

The powerful dental machinery by which a firm hold is gained as a fulcrum for the constriction, and the adaptation of the bones of the head to the dilatation necessary for swallowing the disproportioned prey, are shown in the following cuts.

Head of the great Python of Java, seen from above.

Head of the same.

a, upper part of the head, seen from below; b, the skull, seen in profile.

In the Museum of the Royal College of Surgeons the preparation, No. 292 D (*Physiological series*), is a portion of the vertebral column, with the ribs attached, of a *Python Tigris*. The ribs are articulated to the transverse processes of the vertebræ by shallow ginglymoid joints, which admit of their being moved forwards and backwards on an axis passing through the joints. The ligaments, independent of the articular capsule, are so disposed as to limit the motions of the ribs to these directions: they are two in number,—one situated below the joint, which passes from the head of the rib to the transverse process, and thence is continued to the capsule of the intervertebral articulation; the other strengthens the upper part of the joint, and connects the neck of the rib to the transverse process. (*Cat. Mus. Coll. Chir.*) This illustrates the structure for creeping noticed in the article Boa.

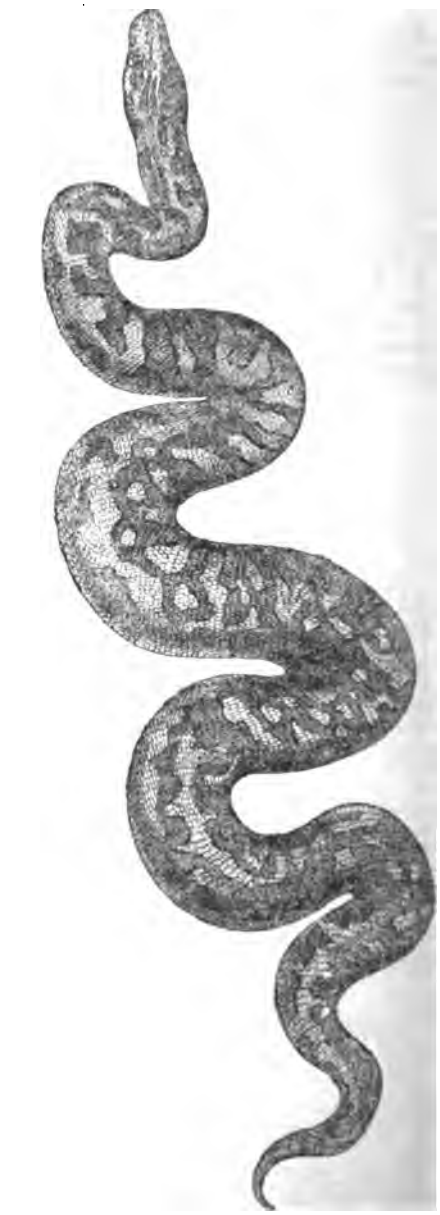
No. 508 A of the same series is the stomach, with part of the œsophagus and intestine injected and inverted, of a large African Snake (Python). The œsophagus, as in all the Ophidian reptiles, is very capacious, smooth internally, and thin in its coats. The commencement of the stomach may be detected by the more vascular and rugous character of its lining membrane. The larger wrinkles are longitudinal, the interspaces reticulate. The stomach gradually diminishes in size, and there is a constriction, like a pylorus, about one inch and a half from the intestine. A narrow canal of uniform diameter, analogous to that in the shark, conducts to the intestine, which suddenly becomes wider, and is beset internally with small flattened scale-like processes. (*Mus. Cat. Coll. Chir.*)

With reference to the observations in the article Boa, relating to the mode of its taking its prey, the gradual deglutition of the victim, and the breathing of the serpent during the operation, No. 1093 A of the same series becomes a very interesting preparation. This exhibits the lungs of a *Python Tigris*. They have been minutely injected, and are laid open to show the extent of the vascular respiratory portion, which is nearly the same in both, but the right lung is principally prolonged to form the reservoir. A part of the trachea, the two pulmonary arteries, and single pulmonary vein, are also preserved in this beautiful preparation by Mr. Owen. (*Cat. Mus. Coll. Chir.*)

The size to which the *Pythons* grow is fully equal to that attained by the *Boæ*, if it does not exceed it. Thus the *Ular-Sawa*, or Great Python of the Sunda Isles, is said to increase till it is more than thirty feet in length, and stout in proportion. The powers of such a gigantic reptile must be enormous, and it is said that the serpent is able to manage a buffalo. Nor are there wanting horrible instances of man himself having fallen a prey to these monsters, in modern times. The story goes that a Malay prow was anchored for the night under the island of Celebes. One of the crew had gone on shore to search for betel-nut, and is supposed to have fallen asleep upon the beach from weariness on his return. In the dead of the night his companions on board were roused by dreadful screams: they immediately went ashore, but they came too late, the cries had ceased, and the wretched man had breathed his last in the folds of an enormous serpent, which they killed. They cut off the head of the snake and carried it, together with the lifeless body of their comrade, to the vessel. The right wrist of the corpse bore the marks of the serpent's teeth, and the disfigured body showed that the man had been crushed by the constriction of the reptile round the head, neck, breast, and thigh. The picture by Daniell, representing a man seized by one of these monsters, will be familiar to many of our readers.

Dr. Andrew Smith, in his valuable *Illustrations of South Africa*, now in course of publication under the authority of the Lords Commissioners of the Treasury, gives a very beau-

Python Tigris.

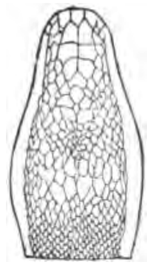


Python Natalensis. (Smith.)

tiful figure of *Python Natalensis;* and he states that this snake, or at least one resembling it in size, was formerly an inhabitant of the districts now within the Cape colony, and that the traditions of the older Hottentots abound with instances of its miraculous powers. At present, he says, it is not to be found within hundreds of miles of the boundaries of the colony, and few specimens have been obtained nearer than Port Natal. He informs us that it occasionally attains a very large size, and, according to the natives, individuals have been seen whose circumference was equal to that of the body of a stout man: Dr. Smith himself saw a skin which measured twenty-five feet, though a portion of the tail part was deficient. 'It feeds,' continues the Dr., 'upon quadrupeds, and for some days after swallowing food, it remains in a torpid state, and may then be easily destroyed. The South Africans however seldom avail themselves of ridding themselves of a reptile they view with horror, as they believe that it has a certain influence over their destinies; and affirm that no person has ever been known to maltreat it without, sooner or later, paying for his audacity.'

The following remarks by the same author are well worthy the attention of those who are interested in the natural history of serpents and their geographical distribution.

'Owing to the difficulty of discriminating between certain species of *Python*, we are not prepared to maintain this reptile to be distinct from the Indian species (*Python bivittatus*, Schlegel). The characters which have been assumed as indicative of specific differences do not appear to us to have been of sufficient value; the modifications to which they are liable in different specimens, of whose specific identity no doubt can exist, show that some other characters must be discovered before certainty can be attained. The Indian species is doubtless an inhabitant of Africa, and there are several specimens of it both from India and Western Africa, in the museum at Fort Pitt, Chatham, which are precisely similar. Between these however and *Python Natalensis* there are several well-marked differences. The scales of *Python Natalensis* are proportionally smaller than in the individuals above mentioned; their form is also different. The labial *fossæ* are more numerous in young specimens from Western Africa and India, than in those of a similar age from South Africa; in the latter they are two upon each side, in the others, four or five; the plates on the head, also, are differently shaped and differently disposed. The pattern of the markings, when viewed in detail, is also distinctly different, though there is a sort of general resemblance. Persons who have opportunities of examining species of *Python* would do well to ascertain if the labial *fossæ* vary in number in different individuals of the same species and of the same size; also whether their number diminishes as age advances.'



Head of Python Natalensis.

PYXACANTHA of the Antients. [LYCIUM.]

PYXIS NAU'TICA (the Mariner's Compass), a southern constellation of Lacaille, placed in Argo. Its principal stars are as follows:—

INDEX TO THE LETTER P.

VOLUME XVII.

VOLUME XVIII.

VOLUME XIX.

Q.

Q is a superfluous letter of the alphabet, having the same sound as *k*, though limited to words where a *u* follows. This letter furnishes evidence that the alphabetical characters were originally of syllabic power. Thus the Hebrew koph and the Greek koppa appear to have been used only in those words where the sound of *o* follows, as in Cos, Corinth, and Syracosii, &c. Indeed the name of the letter implies as much. The Greek alphabet probably stopped at one period, like the Hebrew, at τ, so as to have no *u*. On the other hand, the Etruscan alphabet had a *u*, but no *o*. Hence in Italy, the *q*, which, by position in the alphabet, corresponds to the Greek koppa, was limited to words where a *u* followed. In the same way the kaph of the Hebrew and kappa of the Greek were probably at first limited to those words where an *a* follows, as we know was the case in Latin; and as the modern name of the letter, *ka*, denotes, for it would otherwise have been called *ke* or *ek*. This view becomes more complete if it be called to mind that the name of χ connects it with the vowel *i*; and that the η or Ͱ of the Greek alphabet was originally a guttural aspirate, sounded perhaps as $\chi\eta$, and thus was adopted to denote either a guttural consonant or a long *e*. For the various forms of the symbol *q* see ALPHABET, and for the changes to which the letter is liable see C and K.

QUA BIRD. [NYCTICORAX, vol. xvi., p. 376.]

QUADI, an antient people of Germany, who inhabited the country north of the Danube, between that river, the mountains of Bohemia, and the river March. Towards the north they bordered on the Marcomanni, in connection with whom they are frequently mentioned by the Roman writers as allies. Tacitus (*German.*, 42) mentions the Quadi, the Marcomanni, and the Narisci as being in the foremost rank among the German nations towards the borders of the Roman empire, the Danube forming the line of demarcation between the power of Rome and German independence. At a later period the Quadi joined a great confederacy of German nations against Rome, which occasioned much alarm to the empire, and which twice obliged the emperor Marcus Aurelius Antoninus to repair to Germany at the head of his legions. In the first of these wars, A.D. 174, Aurelius is said to have been unwarily drawn into an ambuscade of the Quadi, and to have been in great danger, when a violent shower of rain afforded a seasonable relief to the Roman army. [AURELIUS, MARCUS.] The second expedition of Aurelius against the Quadi and their allies the Marcomanni, Hermonduri, and Sarmatians, lasted three years, A.D. 178-80, with no decisive result. Capitolinus, in his 'Life of Aurelius,' merely says that if the emperor had lived another year he would have made those countries provinces of the empire. Aurelius however died at Vindobona, in the midst of his campaign, and the Quadi remained unsubdued. They are afterwards mentioned by Eutropius as having invaded Pannonia in the reign of Gallienus.

QUADRA, Island. [NORTH-WESTERN TERRITORY.]

QUADRANGLE and QUADRILATERAL (four-angled and four-sided). These terms are indiscriminately used to denote a figure with four sides in the same plane. [PARALLELOGRAM; RECTANGLE; SQUARE; TRAPEZIUM; RHOMBUS.]

QUADRANT (*quadrans*) originally meant simply the fourth part, but is now in universal use for the fourth part of a circle.

QUADRANT. As an astronomical instrument, the quadrant has within a few years been so completely superseded by the entire circle, that it will not be worth while to describe particularly its construction or adjustments. Still so much of the very groundwork of modern astronomy depends on data furnished by the quadrant, that it cannot be properly passed over without some notice.

We have already said [CIRCLE] that the earliest form of instrument for measuring celestial altitudes was also the best, viz the solstitial or meridian circle described by Ptolemy. After showing how the proportion which the arc between the tropics bears to the whole circumference was to be determined by this instrument, Ptolemy proceeds to say (*Almagest*, book i., chap. 10), 'We have made this sort of observation more conveniently by using, instead of circles, a stout quadrangular block of wood or stone, having one side plane and smooth. Upon this side we described a fourth part of a circle from a centre near one of the angles, and having drawn from the centre two radii including a right angle, we divided the circumference into ninety degrees with subdivisions. We then inserted two perfectly equal cylinders at the extremities of the vertical radius, so as to be exactly concentric with the centre and extreme point, and set the block vertical by a plumb-line passing over the cylinders, and also in the plane of the meridian by a north and south line described on the horizontal plane. We observed at noon the shadow of the central cylinder, having applied something to the divided arc to show the place more clearly, and, marking the middle point, we took the corresponding division of the quadrant as showing the elevation of the sun on the meridian.' It would seem that on the revival of learning, when Ptolemy was thought infallible, the quadrant came into use on this authority, to the exclusion of the circle. In the *Astronomiæ Instauratæ Mechanica* of Tycho Brahé, figures and descriptions will be found of quadrants and sextants of various forms and sizes. We do not think justice is done at the present day to the merits of Tycho, who is better known as the perplexer of the Copernican hypothesis, than as the first great practical astronomer after Hipparchus. Among his numerous instruments Tycho had a large quadrant fixed on a wall, which he calls a *mural* quadrant, with which he observed meridian altitudes, noting the time of transit by a clock. There are several other quadrants figured and described, which revolve on a vertical axis, and some have a horizontal circle by which the azimuth was observed at the same time with the altitude. These may be considered as the precursors of the modern astronomical quadrant, and still more perfect altitude and azimuth instrument, just as his mural quadrant led to the mural arch of Flamstead, the mural quadrants of Bird and Ramsden, and finally to the mural circle of Troughton. The imperfection of his clocks (for the pendulum was not applied till nearly a century later) compelled Tycho to adopt an instrument which has long been out of use. This was his astronomical *sextant*, which was stronger, more convenient, and lighter than the quadrant. It was supported at the centre of gravity on a ball and hemispherical cup, and could consequently be easily placed in the plane passing through two stars, and so used for measuring their distance from each other. To verify the value of the arc, and to test the powers of his sextants and quadrants, the distances of a chain of stars near the equator were taken, and their declinations also observed, when it was found that the sum of the angles at the pole which resulted from observation was 360° very nearly. (Tycho Brahé, *Astronomiæ Instauratæ Progymnasmata*, pp. 138, 145.)

Hevelius has described his quadrants and sextants in the first volume of his *Machina Cœlestis*, a work which is not uncommon; the second volume, containing his observations, was burnt soon after it was printed, with the exception of a few copies, and is one of the scarcest and dearest astronomical books in existence. In the convenience of his instruments, and perhaps in the accuracy of their graduation, he surpassed Tycho, but he never could understand the advantage of telescopic over plain sights, though one of the best practical opticians and industrious star-gazers of his time. This unfortunate prejudice not only rendered the labour of his long life labour in vain, but embittered his latter years to a painful degree by involving him in a dispute with Hooke.

Picart, aided, as it is said, by Auzout, first applied telescopic sights to graduated instruments. In his measure of the earth, executed in 1669 and 1670, he used a quadrant for his terrestrial angles. This he has described, with figures, in a special work, printed at the Louvre, which became so rare that the *Académie Royale des Sciences* reprinted in their Memoirs (vol. vii., part i., p. 133). The quadrant was of 38 inches radius, with one telescope fixed in the direction of one radius, and the other moveable about the centre; the arc of the instrument was divided by transversals, and the angle read off by the index of the moveable telescope was equal to the angle subtended at the quadrant by the objects marked by the crosswires of the two telescopes. The instrument could be fixed on its stand with the plane vertical when used for altitudes, and by an additional piece, a genou, was moveable into any other plane, when it was wanted for surveying. The whole turned on a vertical axis, like Tycho's azimuthal quadrants, but without an azimuth circle. Quadrants like Picard's continued to be made by the French artists and used by their astronomers (with some improvements, of course) up to the latter end of the last century, when they were superseded by the repeating circle of Borda. The verification of the arc and of the graduation was performed in Tycho's manner, only employing well defined objects in the horizon instead of stars.

For a fixed observatory Picard and Roëmer recommended a large quadrant permanently fixed, that is, a copy of Tycho's mural quadrant, with the changes which telescopic sights required. Lemonnier, in the preface to his *Histoire Céleste*, says that La Hire had one erected in the Royal Observatory of Paris, in 1683, and that it was described in the first edition of La Hire's tables. This description he repeats at page xlii. of his own work.

Flamsteed made his earlier observations at Greenwich with a sextant, the plan of which may be understood by conceiving one of Tycho's sextants with telescopes, instead of plain sights, to be mounted on a polar axis. (*Historia Cœlestis*, vol. iii., p. 103.) This instrument was designed for measuring the distances of stars from each other. But in pursuing his primary object, that of settling the places of the fixed stars with accuracy, Flamsteed found that he required a *meridian* instrument. Some unlucky trials at constructing a quadrant were made by the person employed by the Royal Society, and Flamsteed finally constructed, at his own expense, and by Abraham Sharp's hands, the mural arc with which he observed from 1689 to his death.* (See the description and figure, *Historia Cœlestis*, vol. iii., p. 108.) This differed from other mural arcs chiefly in this, that it contained 140° or 150°, so that all stars were observable with it, from Polaris, below the pole, to the south horizon. The arc was placed as nearly in the meridian as might be, and the errors in its place detected by comparing the observed time of the sun's passage over the middle wire of the instrument, with the true time of his meridian passage, as deduced from corresponding altitudes with a quadrant. The pendulum clock, though as yet not a very perfect instrument, had by this time entirely done away with the necessity of observing the mutual distances of the stars.

When Halley succeeded Flamsteed at Greenwich, the observatory appears to have been dismantled. Halley saw the great superiority of Roëmer's *transit* over every other instrument for ascertaining right ascensions, and accordingly introduced it; but he seems not to have perceived the advantages which Roëmer's *circulus meridionalis* possessed over any segment of a circle. In 1725 a mural quadrant was erected by Graham, which was superior to any previous instrument of this construction; it had however one grievous imperfection, the radii being of iron and the arc of brass, every variation of temperature altered the value of the total arc. In 1750, this quadrant, which was subsequently known by the name of the iron or north quadrant, was removed to the other side of the pier, and the celebrated quadrant by Bird set up in its place. Of Bird's method of dividing we have given some account in the article GRADUATION. His reputation, which was a good deal based on this quadrant, introduced similar instruments by himself or Ramsden into almost every observatory of note. Bird received 500*l.* from the commissioners of longitude for his *Method of dividing Astronomical Instruments*, and the work was published by their order in 1767. We are not aware that a more perfect quadrant than the Greenwich *brass* or *south* quadrant was ever constructed. It was with this instrument Bradley made his invaluable observations, which have been reduced with consummate skill by Bessel. (*Fundamenta Astronomiæ deducta ex Observationibus viri incomparabilis James Bradley*, auctore *F. W. Bessel*, *Regiomonti*, 1818.) There is in this work a careful examination of the errors to which the two quadrants were liable.

When the portable quadrant was wanted for astronomical purposes, the plane was fixed vertically, and it is then usually called an astronomical quadrant. A great many instruments of this construction were made by Bird, Ramsden, and the Troughtons, in the latter half of the last century, and in careful hands a great deal of work may be done with such a quadrant.* Thus observations of the sun or stars at the same altitude on each side of the meridian will furnish an excellent determination of the time, and zenith distances of stars near the zenith in reversed positions of the instrument (the arcus excess, as it is called, affords the means) will yield a good latitude. Observations of northern stars combined with southern stars at similar altitudes will give a very close approximation to the latitude when the true places of the stars are taken from a good catalogue. For the mode of adjusting and using the quadrant we must refer to the older books or encyclopædias which treat of astronomical instruments. The inferiority of the quadrant to the entire circle is such that there is no probability of its ever returning into fashion, and we believe there is not a single public observatory in which it is now in use. The single advantage of the quadrant is that the divisions are larger and consequently more easily read and subdivided than in a circle with the same telescope. But this trifling superiority is much more than compensated by the power of reading off the circle at several points and taking the mean. On the other hand it is impossible in the quadrant to secure the exactness of the total arc, or the concentricity of the centre of motion and the centre of the divisions, while the necessity of leaving some liberty of motion to the axis carrying the telescope allows of a little wandering of the centre-work, which is perpetually shifting its place. Thus it was found that in the celebrated Greenwich quadrant, though the error of division was probably not more than 1″, the uncertainty arising from other causes might easily be 3″ or even more. Again, in the mural quadrant it seems difficult so to support it as to resist the long continued effort of gravity in altering its form, without at the same time rendering it unstable. The Greenwich quadrant was found to have sensibly altered its shape, i.e. it had become flattened about 45°, and pulled out at the two extreme radii, which was shown by the errors in the places of stars observed by it when compared with their places by circular instruments, and also by an actual measurement of the several radii and chords. For more minute information the reader is referred to Lalande's *Astronomie*, § 2511, &c. 3me. edition; Vince's *Practical Astronomy*, chapter v.

QUADRANT. Hadley's quadrant is the name sometimes applied to the octant of reflexion which measures an angle of 90°. The principle is that of the SEXTANT.

QUADRANTAL, a name formerly given to spherical triangles, one side of which is a quadrant.

QUADRATIC, BIQUADRATIC (*quadratum*, a square), names given to algebraic expressions, the highest powers of which are the square, and the square of the square, or fourth power, of the letter with reference to which the expressions are considered. [THEORY OF EQUATIONS.]

QUADRATRIX, a name given to curves which may be made useful in the QUADRATURE of other curves. There is one known by the name of Dinostratus, the equation of which is—

$$y = (a - x)\tan\left(\frac{x}{a}\,90^\circ\right),$$

which curve being given, the ordinate, when $x = a$, determines the length of the circle whose radius is a, as follows. Make a rectangle on this ordinate equal to the square of the diameter, and the other side of that rectangle is the circumference of the circle.

The quadratrix of Tschirnhausen has for its equation—

$$y = a\sin\left(\frac{x}{a}\,90^\circ\right),$$

and this curve being given, and also the method of drawing a tangent to it, the circumference of a circle may be thus found: Draw a tangent at the origin, and draw a right-angled triangle with a part of this tangent for the hypothenuse, and a part of the axis for a base: the other side is then the quadrant of a circle which has the base for a radius.

Various other modes might be found of making either of these curves square the circle; but the fact is, that the description of the curves themselves assumes the point which their use is to determine.

* Among the [illegible] which Flamsteed received, we consider the [illegible] of this instrument [illegible] of the greatest, though [illegible]

* A very perfect specimen of the astronomical quadrant is described in Pearson's 'Astronomical Instruments,' vol. ii., p. [illegible]

QUADRATURE. By the quadrature of a curve is meant the finding of a square equal to the content enclosed by the curve; but as every rectilinear figure can be immediately converted into a square of equal magnitude, the object is gained as soon as any rectilinear figure is found of the same content as the curve. This is the geometrical quadrature of a curve. The arithmetical quadrature is the determination of the area enclosed by the curve in terms of a given square unit, as a square foot; and if this be done with any required amount of accuracy, the quadrature, thus done sufficiently for practical purposes, is spoken of as an absolute quadrature. The two following articles will in various places illustrate the preceding description of the meaning of the simple word.

QUADRATURE OF THE CIRCLE. The speculative part of this question might be passed over with a slight description of the means of finding a square equal to a given circle, or of expressing a circle by means of the square on its radius, if it were not that it is connected with one of those propensities, the love of the marvellous, which, carried to an undue extent, tend more than others to throw the mind off its balance, and destroy the comfort of the individual. When it is considered that there are still persons who spend their time, means, and energies in the attempt to overcome a difficulty of which they do not even know the character, it is worth while to enter a little more at length upon this celebrated question of the quadrature of the circle than its mathematical importance would seem to require.

It is a proposition not very difficult of proof, that if a right-angled triangle have the radius of a circle for its base, and a line equal to the circumference for its altitude, the triangle is equiareal with the circle. Hence the quadrature is reduced to the finding a line equal in length to the circumference, either geometrically or arithmetically; or to finding an answer to one or other of the following questions:—

Given a, the diameter of a circle in units of a given kind, required a number or fraction π, such that a multiplied by π may be the number of those same units in the circumference. It is easily shown that this number π must be the same for all circles.

Given the diameter of a circle, required *geometrically* a method of drawing a straight line equal in length to the circumference.

Those who first proposed these questions, found their progress arrested by the insufficiency of their arithmetic and the limitations of their geometry. The former question has long been settled, and it has been shown that the ratio of the circumference to the diameter is INCOMMENSURABLE. The latter question cannot be called finally settled, since there is no proof in which all agree that the geometrical quadrature is impossible, though there are considerations which render it in the highest degree unlikely, and there are also asserted proofs of the impossibility which some admit, and which make even those who do not absolutely admit them think their conclusion all but proved. But the mistake of those who produce pretended quadratures often lies in this, that they do not know what is meant by the word *geometrical*. They imagine that anything is geometrical which deals in notions about space, and deduces that which is not obvious from that which is. But geometry, in the technical sense, is that which results from the use of Euclid's postulates [AXIOM], which permit nothing but the junction of two points by a straight line, the indefinite production of that joining line, and the description of a circle with a given centre, and the line joining that centre with another given point as a radius. These limitations make the whole difficulty; otherwise nothing would be more easy than to determine a circle by the QUADRATRIX, if that were allowed to be drawn, or to suppose a circle to roll on a straight line till the point which first touched the straight line touches it again, in which case the line rolled over is the length of the circumference. When therefore any one imagines, as is often the case, that he has found a method of squaring the circle, it generally happens that he only announces the not very new nor surprising fact, that a difficulty which exists under certain circumstances may be no difficulty at all under others. But in like manner as no one would be held likely to answer the question 'required the way of building a house without the use of iron,' who should first demand a hammer and nails, so the greater number of persons who attempt to square the circle must not be supposed to meet the geometrical difficulty, by assuming powers of which geometry expressly requires the use to be abandoned, until it can be shown to be given in allowing the simple postulates above mentioned.

Aristophanes introduces into his comedy of the 'Birds,' a geometer who is going to make a square circle; Plutarch asserts that Anaxagoras employed himself upon this problem in prison. Hippocrates of Chios actually found the way to make a rectilinear space equal to certain circular spaces, and is reported to have attempted the general problem. There is evidence enough that it acquired an early celebrity, and it may be doubted whether the researches of Euclid in incommensurables [IRRATIONAL QUANTITIES] had not some reference to a supposition that the circle and its diameter might possibly be discovered to belong to a particular class of these quantities. Archimedes, in his book on the mensuration of the circle, is the first who made any approach even to a practical determination of the question; by inscribing and circumscribing a polygon of 96 sides in and about the circle, he demonstrates that the excess of the circumference over three times the diameter must be less than 10-70ths of the diameter, and greater than 10-71st parts. His result is perfectly correct, and even tolerably accurate. According to him a circle of 4970 feet diameter would have a circumference lying between 15,610 and 15,620 feet, the truth being that such a circle would have a circumference of 15,613¾ feet very nearly. This measure of Archimedes gives 3·14286 for the approximate value of π, the ratio of the circumference to the diameter; several of the Greeks are said to have made further approximation, but their results are not preserved.

Among the Hindus [VIGA GANITA] are found the ratios of 3927 to 1250, and also that of the square root of 10 to 1. The first gives $\pi = 3·1416$ exactly, and is considerably more correct than that of Archimedes: the second gives 3·1623, and is much less exact. The date of the first result is not known; but all agree that the writings in which it is found are anterior to any European improvement on the measure of Archimedes. The ratio given by Ptolemy, in the Syntaxis, is 3·141552, not quite so correct as 3·1416, but so near to it that those who doubt of the antiquity of Hindu science will probably suppose the 3·1416 above mentioned to be a version of Ptolemy's measure.

This subject began to be reconsidered in the fifteenth century, in the middle of which were calculated the tables of Rheticus, the celebrated Copernican, from which the value of π might easily have been calculated to eight decimals, but it does not appear that this was done. Purbach used the ratio of 377 to 120, or 3·141667, not so exact as Ptolemy's. Regiomontanus slightly corrected the limits of Archimedes, but Peter Metius, father of Adrian (to whom it is often attributed), and of James (to whom the invention of the telescope has been given), made a decided improvement. He gives the ratio of 355 to 113, or 3·1415929, which is correct to the sixth decimal inclusive. Nothing more precise could be desired for practical purposes, insomuch that a circle of 113 in diameter may be reckoned as one of 355 in circumference, which, though a little too great, does not give the circumference wrongly by so much as one foot in 1900 miles. Metius lived in the latter half of the sixteenth century, as also did Vieta, who gave a still more accurate though not so elegant a measure. He was the first who exhibited a series of arithmetical operations, by which a mere calculator might carry on the process to any extent, and gave the following result: The circle whose diameter is ten thousand million of parts, has a circumference greater than 31,415,926,535 of those parts, and less than 31,415,926,537. Other approximations rapidly followed: Adrianus Romanus calculated the perimeter of an inscribed polygon of 1073741824 sides, by means of which he found for the ratio 3·141592653589793; but his contemporary Ludolph van Ceulen, by calculating the chords of successive arcs, each of which is the half of the preceding, found the perimeter of a polygon of 36893488147419103232 sides, and obtained 36 figures of the ratio 3·14159, &c., presently given to a still greater length. So far the method of calculating by means of inscribed polygons had received no material simplification. This was given by Snell, who found some propositions (afterwards demonstrated by Huyghens) which very much abridge the labour. He found a result as correct as that of Archimedes, by means of a simple hexagon; making the 96-sided polygon of Archimedes give seven decimals correctly, instead of three. He also calculated the ratio to 55 decimal places, and by means of a polygon of only 5242880 sides.

Huyghens introduced some new theorems of the same species as those of Snell.

The invention and cultivation of the differential calculus led to many new views and new methods, into which it is not our purpose to enter, as we intend the present article not for mathematicians, but for those who have just enough of the science to think it possible that the solution of the problem is reserved for them. The continued product of Wallis, the continued fraction of Brouncker, the series of *Mercator*, *Gregory*, *Newton*, &c., were so many new algebraical expressions of a result which, one might imagine, would be considered as carried far enough by the arithmetician. Nevertheless the ratio was consecutively carried to 72 places by Abraham Sharp, to 100 by Machin, and to 128 places by De Lagny, and at the end of the last century to 140 places by Vega. And Baron Zach informed Montucla that he had seen a manuscript in the Radcliffe Library at Oxford, in which it was carried to 154 places.

Vega's result, which, as far as it goes, is confirmed by those of Machin and De Lagny, is as follows:—

3·14159 26535 89793 23846 26433 83279 50288 41971 69399 37510
58209 74944 59230 78164 06286 20899 86280 34825 34211 70679
82148 08651 32823 06647 09384 46095 50582 [illegible]

But the Oxford manuscript gives as the ending (according to Montucla)—

46095 50582 23172 53594 08128 4802

So far as these agree, there is no doubt of their correctness, so that the approximation has been carried to 135 decimals certain. There is only one use in this extent of accuracy, which far exceeds all that is necessary, namely, that the more rational class of solvers of the problem are steadied by it, and are prevented from presenting results which do not agree with the known truth.

The never ending character of these numerals, so far as they were tried, led to an early suspicion that the ratio must be really incommensurable. This was actually proved by Lambert (*Mém. Acad. Berlin* for 1761), and the demonstration has been given in an abridged form by Legendre, in the notes to his work on geometry. This demonstration is perfectly complete, and leaves no manner of doubt on the subject. Those who persist in asserting that they can assign two numbers which are in the ratio of the circumference to the diameter, should first learn geometry and algebra enough to refute this proof, for they may depend upon it that no mathematician will lend them a moment's attention until this preliminary step has been taken. Buffon, and Panckoucke, the editor of the 'Encyclopédie Méthodique,' have attempted to give metaphysical reasons for this incommensurability, apparently in order that the squarers of the circle might not have all the nonsense on their side of the question.

The *geometrical* quadrature, as above described, was attempted to be shown to be impossible by James Gregory, in 1668; and Montucla seems to admit the proof at last,* though he only said that it was *very like demonstration* in the first edition of his work on the history of this problem. The objections made by Huyghens to this proof, and the controversy which ensued, obliged the latter to admit that Gregory had succeeded in proving the impossibility of what is called the indefinite quadrature of the circle, by which is meant the finding of a method of squaring any given sector of the circle whatsoever. But since it is well known that there are curves, particular portions of which may be squared, this may happen in the case of the circle. Thus it might be possible to give a geometrical rule for squaring the whole circle, even though the rule would not apply to any given sector. The proposition which Gregory imagines himself to prove, is that no sector of a circle can have to the circumscribed polygon a ratio expressible by a finite number of algebraical terms. The consequence of this, if established, must be drawn as follows:—Since geometry allows the use of nothing but definite circles and straight lines, a straight line equal to the circle in length (which being found, the whole difficulty is overcome) must be ascertained, if at all, by a construction in which points are successively determined by the intersections of straight lines or circles, or a straight line and a circle. The most complicated constructions in Euclid may, if we begin from the first principles, be reduced to the determination of a succession of points in this manner. Now, in the most complicated case, the intersection of two circles of given or found radii and centres, the points of intersection may be determined by formulæ derived from the roots of an equation not exceeding the fourth degree, the roots of which can be expressed in a finite form; the two ends of the line equal to the circle would therefore be assigned in a finite form, and hence the length itself. And the area of any polygon (whose sides are obtained by continual bisection) described about a given circle would also be expressed in a finite form, from which (the area of the circle being expressible by means of its circumference) the ratio of the area to that of the circumscribed polygon would also be expressible. But if Gregory's proposition be true, this area cannot be expressed in a finite form; neither then can any construction allowable in geometry attain the circumference of a circle.

The indefinite quadrature was shown to be impossible by Newton (*Principia*, book i., lemma 28), in a manner which lies open to solid objections; we shall not therefore produce this proof. In fact, it seems as difficult to induce geometers to agree in any proof of the impossibility of the indefinite quadrature, as others to leave off trying their powers upon what geometers themselves have ceased to attempt.

Montucla has given a tolerable list of those who have signalised themselves by attempting this problem without the requisite preliminary of studying geometry; if preliminary that may be called, which would have made them give up the attempt. 'Only prove to me that it is impossible,' said some one, 'and I will set about it immediately,' and such seems to have been the general feeling of the quadrators, as Montucla calls them. They existed in crowds in the time of Archimedes; and the race is not yet extinct. One Bryso, a Greek, heads the list: he made the circle a mean proportional between the inscribed and circumscribed squares, which happens to be the content of the inscribed octagon. Next we have Cardinal Cusa, Orontius Finæus, and one Simon van Eyk (or Duchesne). At the time when the problem really was of practical importance, every quadrator raised up an opposing mathematician; and the quadrature was sometimes so ingenious, and so near the truth, that it could only be opposed by new approximations to the truth. Thus Cusa was met by Regiomontanus, Orontius by Buteo and Nonius, and Van Eyk by Peter Metius, who was compelled to discover the very close approximation we have given under his name by that of Archimedes being insufficient to expose Van Eyk. Such quadrators were of use, and if some of them would now arise, no one would object to fallacies so ingenious that new truths must be discovered to oppose them. The celebrated Joseph Scaliger, a mere tyro in geometry, tried his hand on this and other problems in 1592, and was met by Vieta, Adrianus Romanus, and Clavius. Longomontanus, the astronomer (refuted by Pell), J. B. Porta, and Hobbes (refuted by Wallis), are three names well known in other pursuits who must go down to posterity as having had distinguished success in false quadrature. The works of the last against geometry and geometers were the consequence of the mortification he felt at not having been admitted to have succeeded in his attempt. Before his time however, Gregory of St. Vincent, an acute mathematician (to whom is due the discovery of the connection between the hyperbolic area and logarithms), had made the most elaborate attempt which ever was published, in his work on the quadrature of the circle (Antwerp, 1647). Such a challenger raised up Des Cartes, Roberval, Huyghens, and Léotaud, who soon despatched him.

As yet we have mentioned only mathematicians, or men of eminence in something: but we have also the Spaniard Falcon (1587), who dialogues with the circle in his preface; Cephirander and Alphonso de Molina, who attribute their discovery to inspiration; the latter overturns Euclid, and found another who was willing to admit his discoveries and translate them into Latin. A merchant in Rochelle, De la Leu, not only found out the problem by inspiration, but shewed that the conversion of Jews, Turks, and Pagans depended upon it. Montucla gives some account of several other visionaries, the chief of whom is one Clurer, who found that the problem depended upon another, namely, 'Construere mundum divinæ menti analogum,' which, if it be translateable, is, 'to make a world analogous to the divine mind.' He also mentions Richard White, an English Jesuit, who stands out among the solvers of the pro-

* The following was the addition left by him, and printed by the editor of the second edition:—"Après avoir relu cette [illegible] plus attentivement [illegible] il me paraît avoir au moins démontré l'impossibilité de la quadrature définie absolue du cercle."

blem as the only one who ever was convinced of his error. The writer of this article once pointed out the example of White to another Roman Catholic clergyman, who had come from South America to England, to publish a quadrature of the circle. The party addressed seemed struck by the instance, and promised to study more geometry before he proceeded further; in a little while however he relapsed, and his work was advertised, and, we believe, published.

After the time of Newton, and the abundant means which were then introduced to complete the quadrature, if such a thing were possible, persons versed in mathematics seem to have dropped the attempt, and the reign of the quadrators by instinct commences. It is true that a serious diversion was made by the theory of gravitation, which drew off against itself many of those who should have been quadrators; but enough remained to furnish a tolerable list.

That of Montucla contains principally Frenchmen, though had the history of mathematics been written by an Englishman, he could have produced as great a number in this country. One Mathulon, in 1728, promised in print 1000 crowns to any one who should convict his solution of error, and was actually sentenced by the courts to pay the sum to the Hôtel Dieu at Lyon, to which charity Nicole, the exposer, made over his claim. One Sullamar (as Montucla spells it), an Englishman, solved the problem by means of the number of the beast, 666, in the year 1750; a M. de Causans, in 1753, found it by cutting a piece of turf, and deduced from it the doctrines of original sin and of the Trinity. He offered to bet three hundred thousand francs on the correctness of his process, and deposited ten thousand, which were claimed by several persons, and among others by a young lady, who brought an action for them: but the bet was declared void by the courts. Many more cases might be added; it is however enough to say that this problem is now never attempted (in print at least), except by those who are either altogether ignorant of mathematics, or add a most undue opinion of themselves to an acquaintance with only the elements. Since 1755, the Academy of Sciences has refused to examine any pretended solution; and the Royal Society in this country came to the same resolution a few years afterwards.

A few words may serve to prevent some one from making an attempt upon this enchanted castle, as it is supposed to be. When the difficulty first began to be noticed, the circle stood alone among curves; and so remarkable a distinction between this, the only curve then considered, and rectilinear figures, the only other figures then considered, could not but excite curiosity. Our position is now changed; not only does the now well recognised distinction of commensurable and incommensurable prevent the circle from presenting anything peculiar to itself, but the curve is only one among an infinitely great number, many of which have been investigated and their properties examined. Consequently, with reference to the present state of mathematics, the problem analogous to that of squaring the circle is, 'Given any curve whatsoever, to find its area.' Now if the ingenuity which is guided by the love of investigating hidden things, should desire a field for its exertions, let it leave that of the circle, which has been cropped until it will yield no more, and, first acquiring sufficient mathematical knowledge, let it spend its force upon some one of the many real difficulties which abound, both in the pure and mixed sciences: let it investigate the meaning of divergent series for example, in all their varieties, or endeavour to extend the theory of discontinuous expressions, or solve the equations of motion of the solar system by some other method than that of series. For one point that should strike the lover of the marvellous in the quadrature of the circle, there are hundreds in the above-named subjects which surprise the mathematician, however little he may possess that quality. Moreover, in like manner as the quadrature of the circle was at one time, in the hands of Wallis, Newton, &c., a road to results which, though they did not attain their end, yet answered many other purposes; so the efforts of the inquisitive on the actual difficulties of our own day may also end in the promotion of science of every kind, if begun in knowledge and directed by system. We owe the binomial theorem, now one of the most important results of algebra, indirectly to the learned attempts of Wallis upon the quadrature of the circle, at a time when such attempts were in season and we might reasonably hope for collateral successes something like those resulting from the labours of Wallis, if those (not a few) whose minds compel them to inquiry into the curious, would but furnish themselves with a guide before they set out on their travels.

QUADRATURES, METHOD OF. The method of quadratures derives its name from its earliest application, that of finding the areas of curves, which was always called their quadrature, as being the arithmetical process by which, when exact, squares equal to them might be found. And since the AREA of a curve can always be found when $\int y dx$ can be found, this term has also been applied to the determination of the definite values of integrals by approximation. Any integral [INTEGRATION] can be found approximately by a summation, the limit of which is the exact value: thus we could determine $\int y dx$ from $x=a$ to $x=a+h$ by dividing h into a large number, n, of equal parts, and actually summing

$$a.\frac{h}{n}+\left(a+\frac{h}{n}\right)\frac{h}{n}+\left(a+2\frac{h}{n}\right)\frac{h}{n}+\ldots\ldots+\left(a+n\frac{h}{n}\right)\frac{h}{n}$$

but the special object of that which is called *the* method of quadratures is the perfection of this method of quadratures (which is either very inexact or very tedious), by subsequent corrections, which are most readily derived from such mathematical considerations of the error committed as are described in the article OPERATION. The theorem on which it is founded may be seen in p. 313 of the 'Differential Calculus,' in the 'Library of Useful Knowledge:' exhibited in the best form for practical use, it is as follows:—

Let $\int y dx$ be required to be found from $x=a$ to $x=a+h$: divide h into n equal parts, and let $A_0, A_1, A_2, \ldots\ldots A_n$ be the values of y corresponding to the following values of x, namely a, $a+\frac{h}{n}$, $a+2\frac{h}{n}$, ... $a+n\frac{h}{n}$ (or $a+h$). Compute

$$S=(A_0+A_1+A_2+\ldots\ldots+A_n)\frac{h}{n}$$

And, writing down A_0, A_1, &c., as below, take their differences. [DIFFERENCE.]

$$\begin{array}{l}
A_0\ \ A_1\ \ A_2\ \ A_3\ \ldots\ldots\ldots\ A_{n-3}\ \ A_{n-2}\ \ A_{n-1}\ \ A_n\\
\quad\Delta A_0\ \Delta A_1\ \Delta A_2\ \ldots\ldots\ldots\ldots\ \Delta A_{n-3}\ \ \Delta A_{n-2}\ \ \Delta A_{n-1}\\
\qquad\Delta^2A_0\ \Delta^2A_1\ \ldots\ldots\ldots\ \ldots.\ \Delta^2A_{n-3}\ \ \Delta^2A_{n-2}\\
\qquad\quad\Delta^3A_0\ \ \ldots\ldots\ldots\ \ \Delta^3A_{n-3}
\end{array}$$

up to the fifth differences, which will be generally sufficient. Then the value of $\int y dx$ from $x=a$ to $x=a+h$ is as follows, very nearly:—

$$S-\frac{1}{2}\frac{h}{n}(A_n+A_0)-\frac{1}{12}\frac{h}{n}(\Delta A_{n-1}-\Delta A_0)-$$
$$\frac{1}{24}\frac{h}{n}(\Delta^2A_{n-2}+\Delta^2A_0)-\frac{19}{720}\frac{h}{n}(\Delta^3A_{n-3}-\Delta^3A_0)-$$
$$\frac{3}{160}\frac{h}{n}(\Delta^4A_{n-4}+\Delta^4A_0)-\frac{863}{60480}\frac{h}{n}(\Delta^5A_{n-5}-\Delta^5A_0)$$

For example, let the integral required be $\int\frac{dx}{x}$ from $x=9$ to $x=13$ (we take purposely a case in which verification is easy). Here $a=9$, $h=4$, $y=1:x$. Divide the interval 4 into ten equal parts, so that $h:n=\cdot4$. We have then 9, 9·4, 9·8, ... 12·6, 13, for the eleven values of x, and writing down their reciprocals, and taking their differences, we have

	A=	ΔA = −·00	Δ²A = +·000	Δ³A = −·0000	Δ⁴A = +·00000	Δ⁵A = − [illegible]

$$\text{Approx. value of } \int_9^{13} \frac{dx}{x} = \cdot 36772479$$

This same result, found by common methods, is hyp. log 13 − hyp. log 9, or 2·56494936 − 2·19722458, or ·36772478: so that the preceding method is in this case more than correct to seven figures by use of four differences.

This method of quadratures is the mathematician's last resource when all others fail or are still longer. In most of the cases in which it is absolutely requisite, the calculation of the values of y is the most tedious part of the operation. When the limits are very different, it is generally requisite to divide their interval into several parts, and to make the integrations through the several parts separately. For an inverse process see SUMMATION

QUA'DRIO, FRANCESCO SAVE'RIO, a learned Jesuit of the eighteenth century, a native of Valtellina, wrote an historical and descriptive work on his own country, which he dedicated to Pope Benedict XIV. 'Dissertazioni Critico-Storiche intorno alla Rezia di quà dalle Alpi oggi detta Valtellina,' 3 vols. 4to., Milan, 1755. It is the best account which we have of that secluded region. The author occasionally exhibits a want of critical fairness, as where he attempts to excuse the massacre of the Protestants which took place in 1620, and was attended by circumstances of great atrocity. But the principal work of Quadrio, and that on which his reputation as a writer chiefly rests, is his general history of poetry in all ages and countries: 'Storia e Ragione d'ogni Poesia,' 7 vols. 4to., Bologna and Milan, 1741-52, a laborious work containing a vast deal of information not found collected in any other compilation. The author treats at length of every branch of poetry, antient and modern. He divides poetry into melic or lyric, scenic or dramatic, and epic and didactic, each subdivided into numerous departments. Under the head of scenic poetry, besides the various sorts of tragedy and comedy, he treats of the numerous class of mimi and pantomimi, of the satirical drama, the Atellanæ, the rustic pastoral, maritime, piscatoriæ, sylvestres, and other fabulæ, and lastly of the musical drama or opera. He also treats at length of the rhapsody, the parody, the burlesque poetry of various kinds with which Italian literature abounds, of dialect, macaronic, and pedantic poetry: he quotes an immense number of writers, many of whom are little known; and he gives extracts from them. Quadrio's work, notwithstanding several mistakes and imperfections, is a very useful library book, and the composition of it occupied the author a considerable part of his life. Quadrio was of an infirm and susceptible temper, which involved him in sundry broils and disappointments, in consequence of which he sought and obtained leave to quit the order of the Jesuits, and assume the garb of a secular priest or abbé. He died at Milan in 1756.

QUADRU'MANA, Cuvier's name for his second order of mammiferous animals, an order which must be always viewed by the zoologist with great interest, inasmuch as it contains those forms among which will be found the nearest approach—though the distance is still great—to Man. [CHIMPANZEE; ORANG-UTAN.]

The order *Primates* of Linnæus consisted of the genera *Homo, Simia, Lemur*, and *Vespertilio*. [PRIMATES.]

Cuvier placed *Homo* aloof in his order *Bimana*, of which it is the only genus. His order *Quadrumana* embraced the *Singes* (*Simia*, Linn., including the Orangs) and the *Makis* (*Lemur*, Linn.); between these two extremes came the *Ouistitis* or *Arctopitheci*. [JACCHUS.]

Of his *Quadrumana*, Cuvier remarks that, independently of the anatomical details which distinguish them from man, they differ from him in the very striking character arising from their hind-feet having free thumbs, which are opposable to the other fingers, whilst those fingers are long and flexible, like those of the hand. They therefore climb trees with facility; but they do not hold themselves or walk erect except with difficulty, their foot in such case not resting on the sole, but on its external edge, and their narrow pelvis not favouring equilibrium in that posture. Their intestines, he observes, are sufficiently similar to ours, their eyes are directed forward, they have mammæ on the breast et penem pendentem. The cerebrum has three lobes on each side, the posterior of which covers the cerebellum, and the temporal fossa is separated from the orbit by a bony partition; but for the rest, they recede gradually from the form of man, assuming a more elongated muzzle, a tail, and a progression more and more exclusively quadruped. Nevertheless, adds Cuvier, the liberty of their fore-arms and the complication of their hands permit among them all many actions and gestures similar to those of man.

Illiger's first order, *Erecta*, like Cuvier's *Bimana*, included man alone. His second order, *Pollicata*, consisted of the *Quadrumana*, the *Prosimii*, the *Macrotarsi*, the *Leptodactyla*, and the *Marsupialia*.

The *Quadrumana* embraced the Orangs and *Simiæ* generally, including *Hapale* (the *Jacchus*).

Mr. Gray divides the *Primates* into the *Anthropomorphous* and *Quadrupedoid*.

The first family of the first division, *Hominidæ*, is thus subdivided:—

†

Tail none.

1. Hominina, *Homo*. 2. Simiina, *Troglodytes*, Geoff.; *Simia*, Linn.; *Hylobates*, Ill.

††

Tail long or short.

3. Presbytina. *Presbytes*, Esch.; 4. Cercopithecina, *Lasiopyga*, Ill.; *Cercopithecus*, Linn.; *Cercocebus*, Geoff.; *Macacus*; 5. Cynocephalina, *Cynocephalus*, Briss.; *Papio*, Briss.

The second family, *Sariguidæ*, is thus subdivided:—

†

Tail end naked.

1. Mycetina, *Mycetes*, Ill.; 2. Atelina, *Ateles*, Geoff.; *Brachyteles*, Spix; *Gastromargus*, Spix; *Lagothrix*, Geoff.

††

Tail end hairy.

3. Callithricina, *Cebus*, Erxl.; 4. Saguinina, *Saguinus*, Lacép.; *Nyctipithecus*, Spix; *Pithecia*, Geoff.; *Brachypus*, Spix; 5. Harpalina (Hapalina?), *Jacchus*, Geoff.

Under the *Quadrupedoid* division, Mr. Gray arranges the *Lemuridæ*, the *Galeopithecidæ*, and the *Vespertilionidæ*.

Under the *Quadrumana*, or *Tetracheirs* (his second order), M. Lesson arranges the *Simiæ* and *Lemuridæ* generally, together with *Loris, Nycticebus, Galago, Tarsius, Cheiromys*, and *Cheiragaleus*.

His first order, *Bimana*, includes man only.

The *Quadrumana* form the first order of the system of Mr. Swainson, who excludes man from the zoological circle. His *Quadrumana* consist of the following families and genera:—

1. Simiadæ.

Simia (including *Troglodytes, Hylobates, Presbytes*, and *Pithecus*, as subgenera).

Cercopithecus (including *Lasiopyga, Semnopithecus, Colobus, Cercopithecus, Cercocebus*, and *Nasalis*, as subgenera).

Inuus.

Macacus.

Papio (including *Papio* and *Cyanocephalus* (Cynocephalus?) as subgenera).

2. Cebidæ.

Mycetes, Lagothrix, Ateles, Cebus, Callithrix, Hapales (including *Midas* as a subgenus), and *Pithecia*.

3. Lemuridæ.

and

4. Vespertilionidæ.

Under the article CHEIROPODA will be found a notice of Mr. Ogilby's views regarding the *Quadrumana*, as far as they had then gone. Those views have since been carried out by that gentleman in the 'Natural History of Monkeys, Opossums, and Lemurs,' being the third volume of 'The Menageries,' in the 'Library of Entertaining Knowledge.' The following table exhibits the respective groups and families, with their relations in a regular and connected series:—

- CHEIROPEDS ... (*Mammals with opposable thumbs*)
  - I. Bimana ... (*on the fore hands only*)
    - Homo.
  - II. Quadrumana ... (*on both fore and hind hands*)
    - Simiæ ... (*and anthropoid teeth*)
      - Troglodytes.
      - Satyrus.
      - Hylobates.
      - Semnopithecus.
      - Colobus.
      - Cercopithecus.
      - Papio.
      - Cynocephalus.
    - Lemuridæ ... (*and abnormal teeth*)
      - Lichanotus.
      - Propithecus.
      - Lemur.
      - Otolicnus.
      - Cheirogaleus.
      - Stenops.
      - Tarsius.
      - Cheiromys.
      - Galeopithecus.
    - Simiadæ ... (*and anthropoid teeth*)
      - Cebus.
      - Ateles.
      - Mycetes.
      - Lagothrix.
      - Callithrix.
      - Aotus.
      - Pithecia.
      - Hapale.
  - III. Pedimana ... (*on the hind hands only*)
    - Didelphidæ ... (*and abnormal teeth*)
      - Phascolarctos.
      - Phalangista.
      - Petaurus.
      - Didelphys.
      - Cheironectes.
      - Dasyurus.
      - Phascogale.

The leading forms of the *Quadrumana*, and indeed most of the genera, will be found under their respective titles in this work.

QUAESTOR (from *quaero: 'qui conquireret publicas pecunias et maleficia,'* Varro, *De Ling. Lat.*, iv. 14) is a name which was common to two distinct classes of officers at Rome, who were only distinguished from each other by different attributes: the name of one class was *quaestores parricidii*; that of the other, *quaestores classici*. As the former class of these officers ceased to exist about the time of the Licinian law, and as the characteristic epithet was not always added by the earlier writers, the two offices were frequently confounded by subsequent authors, such as Tacitus and Ulpian.

The origin of the *quaestores parricidii* was traced by some writers back to the earliest period of Roman history, and it is said that the office of *quaestores parricidii* existed even in the reigns of Romulus and Numa. Livy (i. 26) and Tacitus (*Annal.*, xi. 22) think that they were appointed by the kings; but it is more probable that the kings only proposed the candidates, and that they were appointed by the populus. (Ulpian, 'De offic. Quaest.,' *Dig.*, i. 13.) That the office existed in the reign of Tullus Hostilius is certain, and the general opinion among the Romans was that it was instituted by that king. After the establishment of the republic, the two quaestores parricidii continued to be elected in the comitia of the curies, on the presentation of the consuls, as they were before on that of the kings; but they were now regularly elected every year, whereas before they had only been appointed in cases of emergency. After the decemvirate, they were elected by the centuries. At the time of the Licinian law one part of their functions was swallowed up by the office of the triumviri capitales, while the rest were embodied in the offices of the curule aediles and the tribunes.

The *quaestores parricidii*, according to Niebuhr, were the same as the *duumviri perduellionis*, but Walter (*Gesch. des Röm. Rechts*, p. 855) has adduced a number of passages which seem clearly to prove that the *quaestores parricidii* must be distinguished from the *duumviri perduellionis*, who continued to be elected to the end of the republic, and were real judges in cases of perduellio. The former, on the other hand, were a kind of public accusers, who conducted the accusation and carried the sentence into execution. (Festus, s. v. 'Parici;' Dionys. Hal., viii. 78.) They had also to assemble the comitia of the centuries to sit in judgment on any criminal accused of a capital offence (Varro, *De Ling. Lat.*, v. 9), for which purpose they sent a trumpeter, who proclaimed the day of meeting from the Capitol, at the gates of the city, and at the house of the accused.

The *Quaestores classici* had the superintendence of the public treasury, and are said to have been instituted by Valerius Publicola, who gave the right of electing them to the populus. At first they were only two in number, but in the year 421 B.C. their number was doubled (Liv., iv. 43), and part of them were to be plebeians, but this was not the case until ten years afterwards, when three out of the four quaestores were plebeians. (Livy, iv. 43, 54.) From the time that four quaestores were elected, two accompanied the consuls into the field, while the two others remained in the city (quaestores urbani). After the Romans had made themselves masters of all Italy (489 B.C.), the number of quaestores was again doubled, so that there were now eight of them (Liv., *Epit.*, lib. xv.), for the administration of the financial affairs in the city, in the army, in Italy, and the province of Sicily. One of them, who resided at Ostia, had also to provide the city with corn. (Cic., *pro Sext.*, 17.) Sulla in his dictatorship raised their number to twenty, and Cæsar to forty. (Tacit., *Annal.*, l. c.; Dion Cass., xliii. 47, 51.) During the time of the emperors their number varied. The two quaestores urbani, down to the time of Julius Cæsar, had the administration of the public treasury; they registered the revenue and expenditure of the republic (Ascon. Ped. on Cic., *in Verr.*, ii. 1, p. 158, ed. Orelli; Plut., *Cat. Min.*, 17, 18), received the money due to the state, and made the payments sanctioned by the senate. They had also to receive and take under their especial protection all foreign ambassadors, and those strangers who were connected with the state by ties of public hospitality; finally they had the care of the funerals and monuments which the senate decreed as distinctions for men of great merit (Plut., *Quaest. Rom.*, 43; Val. Max., v. 1, 1; Cic., *pro Flacco*, 18): they kept in the treasury the books in which the senatus consulta were copied, until Augustus also entrusted them with the keeping of the original documents. (Dion Cass., liv., 36.) Julius Cæsar transferred the administration of the treasury from the quaestores to two aediles. (Dion Cass., xliii. 47.)

The military quaestores who accompanied the consuls into the field (Cic., *in Verr.*, ii., 1, 15) had the charge of the money with which the war was carried on, distributed among the soldiers their provisions and pay, and superintended the sale of the booty, the produce of which was either divided among the soldiers or lodged in the public treasury. (Livy, iv. 53.) They had however to give in an account of all their proceedings to the treasury. Cic., *in Verr.*, ii. 1, 14; and Ascon. Ped., p. 167, ed. Orelli.)

With the extension of the Roman empire, a greater number of quaestores was required for the financial administration of the conquered countries and the provinces, and it was chiefly owing to this that their number increased in proportion as the empire became greater. The praetor was therefore usually accompanied in his province by a quaestor, who had the whole financial department under his control, but was, like the other quaestores, accountable to the treasury; in case of his death, the praetor appointed a proquaestor in his stead. (Cic., *in Verr.*, ii. 1, 15.) When the praetor was absent from his province, the quaestor usually supplied his place, and was then attended by lictors. (Cic., *ad Fam.*, ii. 15; *pro Planc.*, 41.) In the consulship of Decimus Drusus and Porcina, the senate decreed that it should be decided by lot which of the quaestors were to be sent into the provinces. (Ulpian, *Dig.*, l. c.) This law was, with very few exceptions, observed until the end of the republic. There seems to be no doubt that the quaestors at all times, after the year of their office was over, had a right to take their seats in the senate; of Sulla it is expressly said that he raised their number to twenty, for the purpose of filling up the vacancies in the senate.

In the time of the emperors we have mention of some quaestors who bore the title of Candidati principis, and who were not sent into provinces, but had only to read in the senate the communications which the emperor had to make to that assembly. From the time of the emperor Claudius it became customary for quaestores, on entering upon their office, to give gladiatorial spectacles to the people, and accordingly none but the wealthiest Romans could aspire to the office.

The quaestores, in the provinces of the Populus Romanus, had the jurisdictio of the Curule aediles, and consequently the right of promulgating edicts. No edicts were promulgated in the provinces of the Caesar. (Gaius, i. 6.)

QUA'GLIO, DOMENI'CO, who has been called the German Canaletto, was of a family that has produced several generations of artists, and whose place of origin was Luino, or Laino, near the Lake of Como. Their ancestor, Julio Quaglio, was a fresco-painter of some note, who followed the school of Tintoretto, in which his father is said to have been educated, and who executed many altar-pieces and other works at Vienna, Salzburg, and Laybach. Lorenzo Quaglio, who was born at Laino, July 25, 1730, accompanied his father, Giovanni Maria, to Vienna, where the latter was engaged as engineer and architect in the imperial service, and where Lorenzo himself was brought up to the latter profession. He erected the theatre at Mannheim, and that at Frankfort, besides many other buildings, which are esteemed for their superior taste; he died at Munich, May 7, 1804. This Lorenzo left a son, named Giovanni Maria (born 1772), who was a distinguished architectural and scene painter. Domenico, the brother of Lorenzo, who was himself an historical painter, had two sons, Julius, an admirable scene-painter at Munich (died January 28, 1801), and an elder son, Joseph (born 1747, died at Munich January 23, 1828), who was even more eminent than his brother, both as a scene-painter and in decoration generally. Joseph had four sons, Angelo, Domenico (the subject of this article), Lorenzo (born December 19, 1793), and Simon (born October 23, 1795). Angelo, who died April 3, 1815, at the age of thirty-seven, was also a scene-painter of extraordinary genius, and some of his productions are described as having had a most astonishing effect, particularly one representing the illumination of St. Peter's at Rome, after studies made by him on the spot.

Domenico was born at Munich, January 1, 1786, and began at a very early age to manifest a fondness for art, especially for perspective and architectural painting. With his father for his instructor, and with his own instinctive feeling to urge him on, he not only made rapid proficiency in the above-mentioned studies, but devoted his leisure to drawing from the life model, to landscape and sketches from nature, and to etching and engraving. In fact he was in some danger of aiming at excellence in too many departments of art, had he not, by the advice of his brother Angelo, determined to devote himself more especially to one. Having imbibed a strong taste for the architecture of the middle ages from Angelo's own drawings of the cathedral of Cologne (made for Sulpice Boisserée's splendid work), he resolved to make the buildings of that period the chief subjects of his pencil. With this view he made an architectural tour to Freiburg and other places, studying their interesting monuments of Gothic architecture. These furnished him with a stock of subjects for paintings on his return, and among the rest for his picture of Regensburg cathedral, which was purchased by Maximilian, the late king of Bavaria, who exhorted the artist to confine himself to the new branch which he had so successfully commenced. Following this advice, which was seconded by that of many other able judges, Quaglio resigned, in 1819, his situation and salary as scene-painter at the Munich theatre, and thenceforth applied himself solely to architectural painting, in which branch of art he gradually established a reputation throughout Europe, and at the same time was not a little instrumental in promoting by his works that taste for the architecture and arts of the middle ages which has of late years taken root in Germany. Independently of their value as portraits of some of the finest productions of German-Gothic architecture, his works are marked by striking picturesque effect. Besides his pictures, which are very numerous, he executed many etchings and lithographic views, and among the latter a series of thirty subjects, entitled 'Denkwürdige Gebäude des Deutschen Mittelalters.' In 1829 he accompanied Mr Gally Knight in a tour to Italy as his architectural draftsman. He died at Hohenschwangau (where he was employed in restoring and improving the castle), of an apoplectic attack, April 9, 1837.

QUAIL. [PERDICIDÆ, vol. xvii., p. 439.]

QUAINI, FRANCESCO, was born in 1611, at Bologna, and studied under Agostino Mitelli, by whose instruction he acquired great skill in perspective and in painting architectural views. The public edifices at Bologna contain several of his works, the most admired of which are the representations of ornamental architecture in the Sala Farnese in the Palazzo Publico.

QUAINI, LODOVICO, the son of Francesco, was born at Bologna, in 1643. After having acquired the rudiments of the art and a knowledge of perspective from his father, he became a disciple first of Guercino, and afterwards of his relation Carlo Cignani, in whose school he was contemporary with Marc Antonio Franceschini. His improvement was so great, that in a few years he was employed, as well as Franceschini, to assist Cignani in the execution of some of his great works. Their method of handling and colouring was so similar, that it was difficult to determine what part of any work was executed by either of them. In Cignani's principal works however it seems that Quaini painted the landscape, the architecture, and other ornaments, and Franceschini the figures. After Cignani's death the two artists continued to work together. They were employed at Bologna, Modena, Piacenza, Genoa, and Rome, where they painted the cartoons for a cupola in St. Peter's, which has since been executed in mosaic.

Quaini also painted many historical subjects from his own compositions, which were entirely finished by himself. In the church of St. Joseph at Bologna there is a picture of the Visitation; in La Carità, the dead Christ supported by the Virgin; and in the church of St. Nicholas the principal altar-piece is by Quaini—it represents that saint in prison visited by the Virgin and an angel, and is favourably spoken of by Lanzi. He died in 1717, aged 74.

QUAKERS, the name first given 'in scorn,' and since habitually, to the sect of Christians who call themselves the 'Society of Friends.' [FOX, GEORGE, vol. x., p. 390.]

Origin.—The founder, or rather the first member of this Society was George Fox, who towards the middle of the seventeenth century, after long wanderings about the country and much spiritual conflict and inquiry into the merits of the sects then raging against each other in England, separated himself from all, feeling that 'none could speak to his condition.' By degrees his religious opinions assumed a distinct form, and in the year 1647, when he was 23 years of age, he commenced his ministry by preaching at Dukinfield near Manchester. In a short time the number of believers in his doctrines increased; in 1648 large meetings attended his ministry in Nottinghamshire, and, notwithstanding cruel persecution, the Society spread from the poor and uninstructed to many of the more opulent and educated classes.

It is not our intention to describe the process by which George Fox was led to adopt his peculiar opinions, or the course of conduct which these induced him, whilst yet a very young man, to pursue. Such a narrative might cast on the sect an air of extravagance, which belongs less to this body in particular than to the period of religious excitement in which it had its rise. Notwithstanding instances of indiscretion or enthusiasm in some of its first members, the early history of the Society is full of examples of undaunted courage in passive and ultimately successful resistance to oppression.

Tenets.—The Society of Friends have no articles or creed, subscription to which is required of their members. Their principal tenets may however be gathered from the writings of George Fox, William Penn, and Robert Barclay, and their other approved authors, and from the minutes and epistles issued by their yearly meeting in London to the subordinate meetings.

They believe that it is the prerogative of God alone to declare himself to man; and therefore they prefer expressing their religious opinions in the language of Holy Scripture. In full accordance with these sacred writings, they have ever believed that there is one God and Father of all, of whom are all things; that there is one Lord Jesus Christ, by whom all things were made, who was glorified with the Father before the world was, who is over all, God blessed for ever; that there is one Holy Spirit, the promise of the Father and the Son, the Leader, Sanctifier, and Comforter of his people: and that these three are one God. Whilst objecting to scholastic terms and distinctions, and to all attempts to be wise in the deep things of God, beyond what He has plainly revealed, they have ever professed their belief in the real manhood as well as the true deity of our Lord and Saviour Jesus Christ; that the Word which was in the beginning with God, and was God, was made flesh and dwelt amongst men. They maintain that man in the fall is separated and alienated in his nature from God; that all have sinned and come short of the glory of God, and are therefore exposed to divine wrath; and that it is solely through the mercy of God in Christ Jesus that any are brought into reconciliation with him; receiving remission of sins through faith in the one propitiatory offering of the Lamb of God, and sanctification of heart through the influence of the Holy Spirit. They believe the Holy Scriptures to be given by inspiration of God, and to be profitable for doctrine, for reproof, for correction, for instruction in righteousness; and they have always professed their entire readiness that their tenets and practices should be tried thereby.

But that which may be regarded as the doctrine mainly distinguishing them from other Christians, is what they apprehend to be a fuller recognition both of the universality and of the teaching of the Holy Spirit. They believe that the light of the spirit of Christ does in measure enlighten every man that cometh into the world; that the effects of the death of Christ are coextensive with those of Adam's transgression, according to the declaration of the apostle, 'As in Adam all die, even so in Christ shall all be made alive;' and, as a consequence hereof, that even those who have not the outward knowledge of the Gospel history may, by giving heed to their measure of this light, become partakers of that salvation which comes by Jesus Christ.

They moreover believe that the guidance of the Holy Spirit is to be experienced by every sincere believer in Christ, in reference both to his religious duties and to his daily walk in life,—that to be guided by the Spirit is the practical application of the Christian religion. They also maintain that this manifestation of the Spirit, given to every man to profit withal, is the only essential qualification of the Christian for service in the church, and is independent of human choice or appointment. They hold it to be the prerogative of Christ to call and qualify by the Holy Spirit his servants to minister in word and doctrine, and that, as in the earliest period of the Christian church, this Spirit was poured upon servants and upon handmaidens, so he continues to call from *women* as well as from men, from the young and from the old, from the unlearned and from the poor, from the wise and from the rich, those whom he commissions to declare unto others the way of salvation. As such have freely received the gift of the ministry, so are they freely to give without hire or bargaining, far less to use it as a trade to get money by. Hence they refuse the payment of tithes and all other ecclesiastical imposts. They believe that the true worship of God is offered in the inward and immediate moving and drawing of his own Spirit; and that all other worship, beginning and ending in man's pleasure, ought to be rejected. Hence they abstain from the use of all prescribed forms of prayer, and refuse to observe appointed days of thanksgiving, or of fasting and humiliation. They believe that as all the types and shadows and ordinances of the law were fulfilled in Christ, so he established no new ordinances to be administered or to be observed in his church, that his baptism is that of the Holy Ghost and of fire, that he himself is the bread of life, and that the communion of his body and blood is inward and spiritual, and that in thus partaking of the substance, the figures are no longer needed. They assert that as God hath assumed to himself the dominion of conscience, all punishment for conscience sake is therefore contrary to the truth; provided that no man under the pretence of conscience prejudice his neighbour. They believe that true religion delivers man from the spirit and vain conversation of this world, and leads him to inward communion with God; and that hence all foolish and superstitious formalities and all frivolous recreations ought to be rejected: thus all public rejoicings are disapproved of.

Friends deem the taking of all oaths unlawful, and much of their sufferings arose from the firmness with which in former days they refused the oaths often wantonly tendered to them. They believe too that all wars and fightings are inconsistent with pure Christianity, and they refuse all participation directly or indirectly in them. They believe marriage to be a divine ordinance, but in their marriages they do not use the intervention of a minister, for whose interference they allege that there is no Scripture warrant. When any of the Society intend to marry, they acquaint their respective men's and women's meetings of their intentions, and the necessary inquiries having been made as to the consent of parents, the freedom of the parties from all previous engagements, and, if the woman is a widow with children, as to the security of a due provision for these, the parties in a public meeting for worship solemnly take each other in marriage, and a certificate of the fact is given to them. Friends abstain from all pomp in the burial of their dead and from the use of mourning apparel or of grave-stones. They do not use the heathen names of the days or months, but designate them by their numbers; and they object to address an individual in the plural number, or by his title of courtesy, or by any designation which they consider as either inconsistent with Christian truthfulness, or as irreverent or merely complimentary; but they have no scruple against the use of the simple names of dignity or office.

Discipline.—The discipline of the Society was at least indicated and to a great extent established by George Fox with much foresight; for notwithstanding the great increase of the body and the altered circumstances of the times, the system has been found adequate to the protection and the government of the Society.

The members of one or more congregations (according to their size) hold monthly meetings for looking to the orderly conversation of the members, for taking care of their poor (a duty which the Society rigidly fulfils to the superseding of all parochial relief), for regulating the proceedings in relation to marriage, and for other matters affecting the well-being of the body.

There are quarterly meetings throughout the nation, to which representatives are sent from the subordinate monthly meetings. There are also monthly and quarterly meetings of women Friends similarly constituted.

There are meetings for worship on Sunday, and in the forenoon of one other day in the week. The epistle from the yearly meeting in 1675 exhorts Friends not to decline, forsake, or remove their public assemblies because of times of suffering; for such practices are not consistent with the nobility of truth.

Finally, there is a yearly meeting of representatives from all churches of the Society throughout Great Britain and Ireland. This meeting is held in London on the Wednesday after the third Sunday in May, and remains sitting many days. It receives reports of the state of the particular churches, and it issues to them a general epistle. A similar representative body or yearly meeting of women Friends is held at the same time for the general supervision of the religious state of those of their own sex, but they have no power to make rules for the government of the body. During the intervals of the yearly meeting, the general business of the Society is conducted by a meeting termed the Meeting for Sufferings, which is a carefully selected standing committee of the yearly meeting. There is a general fund belonging to the Society, called the national stock; it is formed by the voluntary contributions of members, and it is applied to the publication of religious works, the expenses attending applications for legislative relief in cases of suffering, the payment of the expenses of ministers travelling in foreign parts out of the limits of any meeting, and other public objects of the Society.

Whilst it is the duty of the individual members of the Society generally to watch over one another in love, this duty is more especially confided to certain officers of each sex in the respective meetings, who are called overseers, and who, whenever any case of delinquency comes to their knowledge, visit the individual privately, and labour with him in tenderness with a view to his restoration; but if these efforts prove unavailing, they are to bring the case to the monthly meeting, which appoints a committee to exercise further care in reference to it; and if all attempts at reclaiming the offender should fail, he is disowned as a member of the Society by a document issued by the monthly meeting and signed by its clerk.

There are many wise provisions made by the Society for exercising care over those who believe themselves called to the work of the ministry. This care is more especially entrusted to the elders, who are persons chosen for their spiritual discernment, and from having given evidence by the fruits of the soundness of their faith. The eventual recognition or acknowledgment of ministers as such rests however with the monthly meeting at large, including all the men and women members of the congregation. Monthly meetings are cautioned not hastily to give certificates of competence to those who desire to travel in the ministry, but to take care that these are well approved at home, are sound doctrine, of good conversation, and in unity with their own meetings.

This notice of the Society of Friends ought not to be closed without honourable mention of their constant efforts in the cause of humanity. George Fox recommended the establishment of two schools, one for boys at Waltham and one for girls at Shacklewell, 'for instructing them in whatsoever things were civil and useful in the creation;' and a care on this head has been maintained and extended of later time, there being at present several large schools supported by the Society for the children of Friends and those connected with the body in different parts of England and Ireland. Some of these are intended only for elementary learning and religious instruction, others embrace the higher branches of education, and some are connected with agricultural pursuits. The Lancasterian system of instruction has found among Friends some of its most zealous supporters. The minutes of the yearly meetings from 1727 to the present time abound in exhortations to repress the slave-trade and slavery. In 1761 members engaged in the slave-trade were disowned; and the Society, as a body and individually, have been unremitting in their labours to remove this stain from the nation.

QUAKING GRASS is the name given to the various species of gramineous plants belonging to the genus Briza of botanists. They derive their name from their spikelets being always in a state of tremulous motion in consequence of the weakness of the footstalks by which they are supported.

QUALITY (from the Latin *qualis*), in the common acceptation, comprises all attributes that can be given to a thing, with the exception of those of magnitude and quantity, and it matters not whether the attributes are essential to the thing or merely accidental. But in speaking of the qualities of things, we chiefly consider those by which they are distinct from other and similar things. This circumstance accounts for some expressions, such as 'a man or a person of quality,' in which the word quality is used synonymous with *rank*, as *the* quality by which in aristocratical countries one class of men is distinguished from all others.

Among the ten categories or fundamental notions of the philosophy of Aristotle, quality is the third; but Kant, who has reduced the ten categories of Aristotle to four, makes quality the second; and according to him it comprises the notions of existence, non-existence, and limitation, or of reality, negation, and limitation; that is to say, all things which come within the sphere of man's thought are, in the category of quality, either something or nothing, or something of which he can only say what it is not.

QUAMASH is the North American name of an eatable bulb, found in the plains of the Missouri, and called Camassia esculenta by botanists. It is a plant of the Liliaceous order, and is nearly allied to the European squill.

QUAMOCLIT, a genus of climbing ornamental plants of the natural family of Convolvulaceæ, chiefly found in the hot parts of America, but species are indigenous both in India and China. The genus is characterised by having a 5-leaved calyx. Corol somewhat salver-shaped, plicate, and 5-lobed. Stamens 5, inserted into the base of the corolla. Ovary 4-celled. Cells with single ovules. Style simple. Stigma capitate and bilobed. Capsule 4-celled, 4-valved. Seeds 4, erect. Climbing plants with the leaves alternate, cordate, entire, lobed, or pinnatifid; peduncles axillary; one or many flowers of a red colour. Q. vulgaris is common in every part of India, and, being a beautiful plant, has been cultivated in this country as a tender annual. The name of the genus has been taken from that of this species, which was Ipomæa Quamoclit, the latter name signifying dwarf-bean, because, though smaller, it resembles the kidney-bean in its habit.

QUANTITY. There is little here to add to what has been said in the article Magnitude. The quantity of anything is the answer to *quantus?* (how much?) and the considerations under Ratio are necessary to the precise answer. Mr. Mill, in his 'Elements of the Human Mind,' has invented the word *tantity*, since *quantus* (how much) is answered by *tantus* (so much); and he therefore uses quantity and tantity as correlative, or, as he terms them, connotative words. But in truth the meaning of *quantity*, as generally received, does not refer to the question, but to the answer; so that the word *tantity*, if introduced, could only mean the same thing as quantity, unless the meaning of the latter word were changed. If any one were to propose that quantity should signify what it does at present, with the addition of a reference to seeking, requiring, or asking, and that tantity should involve the same notion, its object being considered as found, given, or determined, undoubtedly the proposition would be a good one, considered apart from the difficulty of altering established meanings. The word quantuplicity, as distinguished from quantity, means the answer to how many times, as distinguished from how much. [Ratio.]

QUANTITY OF MATTER. [Mass.]

QUANTITY OF MOTION. [Momentum.]

QUARANTINE. Quarantine regulations are regulations, chiefly of a restrictive nature, for the purpose of preventing the communication from one country to another of contagious diseases, by means of men, animals, goods, or letters. The origin of the term *quarantine* (which originally signified a period of forty days during which a person was subject to the regulations in question) is explained in the article Lazaretto. The period of forty days during which a widow entitled to dower can remain in her husband's mansion-house after his death is also called, in our law, the widow's quarantine. (Blackstone's *Commentaries*, vol. iii., p. 135.)

Quarantine regulations consist in the interruption of intercourse with the country in which a contagious disease is supposed to prevail, and in the employment of certain precautionary measures respecting men, animals, goods, and letters coming from or otherwise communicating with it. Men and animals are subjected to a probationary confinement, and goods and letters to a process of depuration, in order to ascertain that the contagious poison is not latent in the former; and to expel it, if it be present, in the latter. Quarantine regulations respecting *men* and *animals* are therefore founded on the assumption that the contagious poison, after having been taken into the constitution of a man or an animal, may remain dormant in it for a certain time, and that a seclusion of a certain duration is necessary, in order to allow the disease time to show itself, or to afford a certainty that the disease is not there. Quarantine regulations respecting *goods* and *letters* are founded on the assumption that the contagious poison may be contained in goods and letters, and transmitted from them so as to communicate the disease to men.

The country from which the introduction of a contagious disease is apprehended, may either be conterminous with the country which establishes the quarantine regulations, or may be divided from it by the sea. Accordingly quarantine lines may either be drawn round a coast, as is the case in France, Italy, and Greece, with respect to the Levant, or they may be drawn along a land frontier, as on the frontier between Austria and Servia and Wallachia.

The contagious diseases which quarantine regulations are intended to guard against are plague and yellow-fever, and latterly cholera. We are not aware whether small-pox has ever been made a subject of quarantine regulations; but this question is now of no practical moment, since vaccination has supplied a preventive of small-pox far more efficacious than any quarantine regulations could be.

The most important disease, with reference to quarantine regulations, is the *plague of the Levant*; and in practice quarantine regulations are of little importance except with respect to the intercourse by land and sea with Turkey, Asia Minor, and Egypt, and some other of the Mohammedan countries bordering on the Mediterranean.

In the article Pestilence there is an explanation of the nature of the disease styled plague, which, although formerly prevalent over the whole of Europe, is now nearly confined to the Levant; and it is there stated that its symptoms, morbid changes, history, and mode of propagation, bear so close a resemblance to those of the malignant typhus of this country, that it is difficult to regard them otherwise than as different types of the same disease. [Vol. xviii., p. 15.] It is also shown in the same article that the plague of the Levant appears to be generated by the same causes which generate typhus in this country, namely, filthy, crowded, and ill-ventilated dwellings, want of personal cleanliness, defective drainage, and insufficient or unwholesome food (Report of Dr. Arnott and Dr. Kay, in the Appendix to the *Fourth Annual Report of the Poor-Law Commissioners*, p. 103), and that when the disease has been thus generated, it may, particularly under the influence of any of the causes which originally produced it, be communicated from one person to another. It appears likewise that its communication from one person to another is promoted not only by filth, want of ventilation, and the other usual accompaniments of squalid poverty, but also by certain atmospheric causes, such as a certain state of heat, moisture, &c., respecting which we are as yet imperfectly informed. [Vol. xviii., p. 16.] The plague therefore is both epidemic and contagious; that is to say, it may either be generated by local causes, which simultaneously affect a large number of the inhabitants of a country, or it may be communicated directly from one person to another. Where a disease is both epidemic and contagious, it is difficult to determine what proportion of the cases of it are due to local causes and what proportion to contagion. The analogy of typhus in this country would lead us to believe that the number of cases of plague in the plague countries produced by contagion is small as compared with the number produced by local causes. The invisible nature of the ordinary causes of plague and other epidemic diseases, and the simultaneous seizure of many persons in the same district, the same street, or the same house, have naturally led to the belief that the disease is in every case communicated from one person to another; according to the fallacy ingeniously exposed by Dr. Radcliffe, who, on being asked his opinion respecting the contagiousness of epidemic diseases, answered: 'If you and I are exposed to the rain, we shall both get wet; but it does not follow that we shall wet one another.'

This view of the ordinary causes of plague is likewise confirmed by the undoubted fact which is adverted to in the article PESTILENCE, that the poor are the chief sufferers by it, and that it prevails most in the filthiest and worst quarters of towns. Since this fact is of much importance, we will cite the excellent testimony of Dr. Patrick Russell, in addition to what is said in the article PESTILENCE. Speaking of the plague at Aleppo in 1762, he makes the following remarks:—'The villages appeared to suffer in a singular degree, owing perhaps to the structure of the huts and cottages, which are small, with few or no windows, and stand crowded together. In this they resemble the Keisarias within the city, which are inhabited by the lower class of people, and in which the contagion spreads also with great fury. The inhabitants of the city of the same class, but who live in districts where the houses are less connected, suffered more than the middling class possessing more airy habitations, but less than the Keisarias. The people of rank, or in higher offices, *notwithstanding the promiscuous crowds frequenting their palaces*, suffered least of all. Neither the governors of the city, the cadi, nor the nakeeb, and very few of the agas of superior rank, were themselves infected, though the plague had penetrated into most of their harems, and many of the pages and other attendants without doors were carried off by it. In these great harems however the contagion seldom spreads much; of perhaps about forty females, not more than four or five being infected. . . . Of all people, the Jews appear to have the strongest dread of the plague, a circumstance in one light rather fortunate, no place being more favourable to its propagation than the habitations of the lower class of that nation. The houses are small, or, if large, the different apartments are crowded with different families. Many of the houses are more than a story below the level of the street, in a condition half ruinous, dirty in the extreme, damp, and badly aired, from the nature of the situation; and the wretched inhabitants are clothed in rags. When one of them is taken ill, and known to have the plague, he is immediately abandoned to the care of an attendant, and the rest of the family seek refuge, if possible, at some distance. The families lodged in the other apartments, all not having it in their power to fly, are obliged to remain, but avoid approaching the chamber of the sick, and restrain their children from going into the court-yard. Thus pent up, they suffer all the inconveniences of the hot season in the midst of perpetual dread, till at length, what often happens, they also are attacked with the distemper. It was not without horror I descended into these dreary mansions.' (Russell's *Historical Journal of the Plague*, pp. 61-64.)

From the fact of the plague prevailing principally among the poor, and rarely attacking the rich, it may be inferred either that the plague is produced exclusively by the filth, crowding, and bad food to which the poor are subject; or that, if it be contagious, the contagion does not in general take effect upon the inhabitants of spacious and cleanly houses, who are clean in their persons, orderly in their habits, and have a sufficient supply of wholesome food. We see that diseases which appear to be contagious under nearly all circumstances, prevail equally among the rich and poor; and that none of the physical advantages possessed by the latter afford any security against it. Thus, before the introduction of vaccination, small-pox was equally destructive to persons of all ranks in society; and the contagious diseases which attack children, as measles and hooping-cough, make no distinction between the children of the rich and the poor.

There seems to us to be no reasonable doubt that the plague is contagious—in other words, that it can be communicated directly from one person to another—provided there be circumstances favourable to its transmission. A quarantine for men may therefore be expedient for countries where the spread of the plague, supposing it to be introduced, is not improbable. The duration of this quarantine ought to depend upon the time during which the disease may be latent in a person who has taken it by contagion or otherwise.

Since the plague is a peculiarly malignant and destructive fever, and runs its course with a rapidity far greater than typhus, there seems a fair ground for concluding that its poison would not be long latent in the human body. The answers of the protomedico of Malta respecting the plague in Malta of 1813, state that 'the periods at which the disease made its appearance in different individuals after communication were various. It was generally from the third to the sixth day; sometimes longer, even to the fourteenth day, but not later.' (Dr. Maclean, *On Epidemic and Pestilential Diseases*, vol. ii., p. 29.) M. Ségur Dupeyron, the secretary of the Council of Health in France, states, in his Report on Quarantine to the Minister of Commerce (May, 1834), that 'the physicians who have made a close study of the plague are pretty generally of opinion that its poison cannot be latent in the human body more than fifteen days; and the cases of plague introduced into the lazarettoes confirm this opinion' (p. 48). We believe that the cases of plague which have of late years occurred in the lazarettoes of Valletta, Marseille, and Leghorn have broken out either at sea or shortly after the ship's arrival. When the line of French steamers was first established, in 1837, between Marseille and the Levant, it was arranged that the steamers coming from the Levant should perform their quarantine at Marseille. But in consequence of several cases of plague having broken out on board the steamers before they could reach Marseille, the French government decided that they should perform their quarantine at the nearest practicable station, namely Malta.

It is commonly assumed that actual or nearly actual contact is necessary in order to communicate the plague. 'All measures against the plague (says M. de Ségur Dupeyron) are founded on the opinion that, except within a very small distance from the body, contact alone can give the disease. Consequently goods taken from ships with different bills of health are often placed in the same warehouse; and physicians who have visited plague patients, without having touched them, are not put in quarantine, and are permitted to go about immediately after their visit' (p. 76). We believe the idea that actual contact is necessary for the communication of the plague to be utterly erroneous; and we entertain no doubt that under circumstances favourable to its communication, such as filth, crowding, and want of ventilation, the poison of the plague might be introduced into the human body by inspiration through the lungs. We account for the escape of the physicians, guardians, and others, who come within a short distance of the plague-patients in lazarettoes, by the supposition that in the isolation, cleanliness, and good ventilation of a well managed lazaretto, the contagion of the plague is exceedingly feeble.

With respect to the quarantine of animals, it may be remarked that, according to the belief commonly received in the Mediterranean, all living animals are capable of communicating the plague. Accordingly horses, asses, cattle, and sheep are placed in quarantine upon their importation. There is, we believe, an idea among the Franks resident in the plague countries, that the horse cannot communicate the poison of the plague, but that it is frequently communicated by other animals, especially by cats. (See Maclean, vol. i., p. 202.) We suspect that there is no foundation for the notion that plague can be communicated by means of animals.

Goods carried in ships or by land are subject to quarantine, according as they belong to the class of susceptible or unsusceptible goods. Goods which are supposed to be capable of containing and transmitting the poison of the plague are called *susceptible*. Goods which are supposed to be incapable of containing and transmitting the poison of the plague are called *unsusceptible*. All animal substances, such as wool, silk, and leather, and many vegetable substances, *such as* cotton, linen, and paper, are deemed susceptible. On the other hand, wood, metals, and fruits are deemed unsusceptible. In Venice an intermediate class, subject to a half quarantine, is introduced between susceptible and unsusceptible goods (Ségur Dupeyron, p. 70); but this classification appears to be peculiar to the Austrian dominions. All susceptible goods are unladen in the lazaretto, and are there exposed to the air, in order to undergo a process of supposed depuration.

The grounds of the received distinction between susceptible and unsusceptible articles must, we conceive, be altogether fanciful; since we cannot discover any evidence that the plague has ever been communicated by merchandise. Whenever the plague has been introduced into the lazarettos of the Mediterranean, it has always been introduced by passengers or their *clothes*. (Ségur Dupeyron, p. 45–48.) It may be added, that the persons employed in the process of depurating susceptible goods have never been known to catch the plague, which could scarcely have failed to be sometimes the case if the poison of the plague could be transmitted through goods. (See answer 22 of the Maltese *Examination*, in Maclean, vol. ii., p. 31.) It seems to be likewise supposed that some substances are not only unsusceptible, but can even nullify the poison of the plague in susceptible articles. 'At *Trieste* (says M. de Ségur Dupeyron), the juice of dried grapes is considered as a purifier; and consequently currants in susceptible wrappers are allowed to pass without the wrappers being subjected to any quarantine' (p. 73).

There appears however to be conclusive evidence that the clothes and bedding of plague patients have transmitted the plague. (Dupeyron, p. 32–71.) We believe the danger of its transmission in this manner to be equal to the danger of its transmission by passengers.

We are not aware of any well authenticated example of the transmission of plague by means of letters. Nevertheless, as paper is considered susceptible, letters coming from and passing through the plague countries, are opened and fumigated at the lazarettos, a process which is often productive of mistakes, delays, and other inconveniences.

Every ship is furnished by the consul or other sanitary authority at the last port where it touched, with an instrument, styled a bill of health, declaring the state of health in that country. If the ship brings a clean bill of health, the passengers and goods are not subject to any quarantine. If she brings a foul bill, they are subject to quarantines of different durations, according as the plague is known or only suspected to have existed in the country at the ship's departure. On account of the prevalence of plague in the countries upon the Levant, they are considered as permanently in a state of suspicion, and no ship sailing from any of them is considered to bring a clean bill. The periods of quarantine vary from two or three to forty days; the usual periods are from ten to twenty days.

For a description of the buildings in which passengers usually perform their quarantine, and in which goods are depurated, see LAZARETTO. The most spacious and best appointed lazarettos in the Mediterranean are those at Malta and Marseille. To the statements contained in the article just referred to, we add the following curious description of a quarantine station on a land frontier, quoted from a MS. journal in Murray's 'Handbook for Southern Germany,' p. 127. 'Outside Orsova, by the waterside, and near the ferry over the Danube, stands the Parlatorium, a wooden shed in which the market (skela) is held three times a week. On account of the quarantine regulations, the inhabitants of Servia and Wallachia are prevented coming in contact with the subjects of Austria, and dare not cross the frontier without an escort. The Austrian quarantine is five days for those who come out of Wallachia, and ten for those from Servia, increased to forty days in time of plague. The Wallachians again have a quarantine of five days against the Servians; so that none of the three parties can intermix for the purpose of buying or selling, nor can they touch each other's goods. On this account the building where the market is held is divided by three partitions, breast high, behind which the dealers of the three nations are congregated. In an open space in the centre is a table, by the side of which the Austrian quarantine officers take their stand, aided and supported by a guard of soldiers with fire-arms and fixed bayonets to enforce order and obedience. Whenever a bargain is made, the money to be paid is handed to one of the attendants, who receives it in a long ladle, transfers it to a basin of vinegar, and after washing it, passes it on to the opposite side. The goods to be purchased are placed within sight, and are immersed in a tub of water, or fumigated, when they happen to change owners. It is an amusing sight to see the process of bargaining thus carried on by three parties at the distance of several yards from each other, attended by the vociferation and gesticulation inseparable from such business. When the barter is transacted, the Wallachians are escorted back to their own territory, as they had previously been in coming to the spot, by a guard of soldiers, and the Servians recross the river in their boats.'

The institution of quarantine originated at Venice, in which city the expediency of some precautions against the introduction of the plague was suggested by its extensive commercial relations with the Levant. A separate hospital for persons attacked by the plague was established in an island near Venice, in 1403; and the system of isolating passengers and depurating goods appears to have been introduced there about 1485. The system thus established in Venice gradually spread to the other Christian countries in the Mediterranean, and has been adopted, to a greater or less extent, over all the civilised world.

It is much to be desired that the plan of an inquiry, by competent medical authority, into the grounds of the existing quarantine regulations in the Mediterranean to be conducted under the direction of the chief European powers (which has been suggested by M. de Ségur Dupeyron, Dr. Bowring, and others), should be adopted. It cannot be expected that the causes of plague and the mode of its communication will receive any light from the semi-barbarians who inhabit the Mohammedan countries of the Levant. Moreover, quarantine regulations cannot be changed without the consent of the different nations which are concerned in their enforcement. The reason why it is necessary for a nation to adapt its quarantine regulations to the received opinions upon the subject, is explained in the following extract from a paper respecting quarantine regulations in the Mediterranean, which was printed in the Malta 'Government Gazette' of the 19th December, 1838:—'The quarantine regulations of the English colonies in the Mediterranean cannot be changed by the simple will of the English government without producing inconveniences far greater than those arising from the existing system. If the English government should change the quarantine regulations of Malta and its other colonies in the Mediterranean without previously obtaining the approbation of the sanitary authorities of the neighbouring countries, the pratique granted in those colonies would not be received elsewhere; and all vessels coming from any of those colonies would be subjected to a quarantine of observation (from eight to fifteen days). The latter liability would attach to ships of the royal navy as well as to merchant vessels; so that no ship of war sailing from Malta could communicate with any part of France, Italy, or Austria, without being previously subjected to a quarantine of observation. Malta, in particular, would suffer most severely by being unable to give an effectual pratique to ships performing quarantine in the harbour of Valletta, and by subjecting all ships clearing out of that harbour to a quarantine of observation. Not only would its transit trade be almost completely destroyed, but it would lose its importance as a quarantine station. Its importance as a quarantine station is now daily growing, on account of the establishment of the French steamers to the Levant, and the use of the overland journey to India. It would however cease to be a quarantine station if its pratique was not received by the Board of Health at Marseille, and by the other sanitary authorities of the Mediterranean. In order therefore that the quarantine regulations of the English colonies in the Mediterranean might be safely altered, it would be necessary that the alterations should be made in concert with the governments of the neighbouring European countries.'

The small states of Italy are suspected (and, we fear, with justice) of abusing quarantine regulations for the purpose of preventing commercial intercourse, and also for the sake of the profit to be made by farming out the quarantine dues.

But in Trieste, Marseille, and Malta the system is, we believe, perfectly free from all taint of corruption, and is maintained with the full concurrence of public opinion among the inhabitants of those towns. Indeed, it may be said that the popular jealousy is rather lest the restrictions should not be severe enough, than lest they should be too severe. It is therefore manifest that the system cannot be improved until the opinions upon which it is founded have undergone a thorough investigation.

The heads of the English law respecting quarantine are contained in the 6 Geo. IV., c. 78. This Act also confers upon the king in council extensive powers for making quarantine regulations. A full official abstract of the regulations established by this statute, and of the orders in council made under it, may be seen in M'Culloch's *Commercial Dictionary*, article 'Quarantine.'

QUARE I'MPEDIT. When an ecclesiastical benefice becomes vacant by the death, cession, &c. of the incumbent, unless the patron [ADVOWSON] present his clerk, that is, a clergyman, to the bishop of the diocese for institution, within six calendar months, the right will lapse to the bishop, who may collate to the vacant benefice. But if a presentation be made by the patron within the six months, and that presentation is rendered ineffectual by the bishop's refusal to institute the clerk presented, the patron may obtain redress for this interference with his right of patronage in an action of Quare impedit, a proceeding so called because the writ by which the action is commenced requires the defendant to state Quare impedit (why he hinders) the plaintiff from exercising his right of presenting to the vacant benefice. If the bishop be the sole disturber of the right, as is the case when he rejects the clerk upon an unfounded allegation of personal incapacity, as illiterature, immorality, &c., the action of Quare impedit is brought against the bishop alone. Where the bishop has instituted a clerk upon the presentation of a party wrongfully claiming to be patron, the action is usually brought against the bishop, the patron so claiming, and his clerk jointly; for unless the bishop be made a party to the suit, a title to present by lapse will accrue to him if the suit remain undetermined at the end of six calendar months from the death, &c. of the last incumbent, and the benefice remain vacant, and the clerk instituted is, in consequence of the want of title in his patron, shown to be an intruder. If the patron be omitted, the proceeding is void, inasmuch as the validity of the title under which he has presented, as opposed to that set up by the plaintiff, is the subject to be inquired into. If the clerk be omitted, there can be no process (in a suit to which he is no party) to remove him from the benefice in case he has been instituted, and is ultimately found to have been presented on an insufficient title; and the consequence will be that the plaintiff must lose his right of presenting to the benefice for the present turn.

The writ of Quare impedit commands the defendants to permit the plaintiff to present a fit and proper person (without specifying any particular clerk) to the vacant church, vicarage, or other benefice of which he claims the patronage, and which the defendants, as it is alleged, obstruct; and unless they do so, then they are required to appear in the Court of Common Pleas, to show the reason why they hinder him. The defendants having been summoned, by delivering to them a copy of this writ, and having entered an appearance in the court, the plaintiff states his complaint more fully by his declaration, in which he must set out some former presentation to the same benefice, and if that presentation was not by himself, he must formally deduce a title to himself, by descent or purchase, from the party by whom the presentation on some former vacancy is alleged to have been made. The declaration must also show a disturbance before the bringing of the action. Upon this the bishop and the clerk usually disclaim all title, save only, the one, as ordinary, to admit and institute, and the other as presentee of the patron, who is left to defend his own right. But if the bishop has done more than he was bound to do as ordinary, especially where he has wrongfully collated the benefice, the plaintiff may, in his replication, allege special disturbance in the bishop for the purpose of making him a substantial defendant. If the plaintiff fail in making out his own title, the defendant is put upon the proof of his, in order to obtain judgment for himself if needful. But if the right be found for the plaintiff on the trial, the jury who try the cause are to inquire of three other points: 1st, Whether the church, &c. is full, and if full, of whose presentation; for if it be of the defendant's presentation, then the clerk is removeable, provided the writ has been brought in due time; 2nd, What the value of the living is, and this with a view to the assessment of damages, which are directed to be given by the statute (13 Ed. I.); 3rd, In case of plenarty (that is, of the benefice being full), upon a usurpation (wrongful presentation), whether six calendar months have passed between the avoidance (the occurrence of the vacancy) and the time of bringing the action; because the statute which permits a usurpation to be devested by a Quare impedit, does so only when the action is brought within the six months, and at common law plenarty was a bar to the action of Quare impedit, however early the action might have been commenced. If the jury find that the plaintiff had the right to present, and that his action was commenced within the six months, he has judgment to recover this presentation; and if the church, &c. be full by institution of any clerk, process issues to remove him, unless whilst the action was depending, the bishop (not having been made a party to the suit) has collated by lapse; in which case the plaintiff loses the present presentation, but is entitled to recover the full amount of the income of the benefice for two years from the defendant, the pseudo-patron, as a satisfaction for the turn lost by his disturbance; and in case of inability to pay, the defendant is liable to imprisonment for two years. But if at the termination of the suit the church still remains void, the party to whom the presentation is found to belong, whether plaintiff or defendant, may sue out a writ 'ad admittendum clericum,' by which, after reciting the judgment of the court in the action of Quare impedit, the bishop is commanded to admit and institute the clerk of the successful party. If, upon this writ, the clerk be not admitted, the patron may recover satisfaction in damages against the bishop in an action for such refusal.

The patron only, and not the clerk, can maintain an action against the disturber. But under several statutes passed in the reigns of James I., William and Mary, and Anne, which took away the right of presentation from Roman Catholic patrons, the clerks presented are empowered to take certain proceedings in support of their interests. The right of presenting to benefices belonging to Roman Catholic patrons is vested by those statutes in the universities of Oxford and Cambridge, according to a distribution of counties given in the act of James I.; most of the counties in the south and west of England being for this purpose annexed to Oxford, and those in the north and east to Cambridge. The 12 Anne, st. ii., c. 14, provides (s. 4) that besides the writs of Quare impedit which the universities as patrons are entitled to bring, they or their clerks may file a bill in equity against any person presenting to such livings and disturbing their right of patronage, in order to compel a discovery of any secret trusts for the benefit of Roman Catholics in evasion of these statutes: and also (by 11 Geo. II., c. 17) to compel a discovery whether grants or conveyances of such advowsons were made *bonâ fide* to a Protestant purchaser for the benefit of Protestants and for a full consideration; without which requisites every such grant and conveyance of any advowson is declared to be void. This is the only case in which the clerk is at liberty to interfere with the recovery of a presentation of which he is afterwards to have the advantage.

The statutes giving to the universities the right to present to benefices belonging to Roman Catholic patrons do not affect the exercise of the right of patronage in any other class. Dissenters, and even Jews and pagans, may exercise this right. When the disability was first created, persons professing the Roman Catholic religion were the only class from whom any danger in a political or religious point of view was apprehended; and the circumstance that persons who have been admitted to holy orders in the Church of Rome are capable of holding benefices in the Church of England, may perhaps have increased the jealousy with which Roman Catholic patrons were regarded by the legislature.

It has lately been held that these statutes do not transfer any right of presentation to the universities where the patronage of a vacant benefice is vested in several parties, unless all of them be persons professing the Roman Catholic religion. If there be two patrons, one a Protestant and the other a Roman Catholic, the entire right of presentation vests in the former. (6 Bingham's *New Cases*, 146.)

By 3 & 4 Will. IV., c. 27, § 30, it is enacted that no person shall bring any Quare impedit or other action, or any suit to enforce a right to present to or bestow any church, vicarage, or other ecclesiastical benefice, as the patron thereof, after the expiration of the period during which three clerks in succession shall have held the same, all of whom shall have obtained possession thereof adversely to the right of presentation or gift of such person, or of some person through whom he claims, if the times of such incumbencies taken together shall amount to the full period of sixty years; and if the time of such incumbencies shall not together amount to the full period of sixty years, then after the expiration of such further time as with the times of such incumbencies will make up the full period of sixty years.

QUARENGHI, IL CAV. GIACOMO, was born at Bergamo, September 20, 1744. He received a liberal education, and early displayed a turn for poetical composition, besides a taste for the fine arts, among which last he may be said to have been domesticated from his infancy, both his father and grandfather being painters. He was accordingly destined for the same profession, and when sufficiently advanced, was sent to pursue his studies at Rome, where he became a pupil of Mengs, and afterwards of Stefano Pozzi. But he subsequently abandoned painting for architecture, for his attainments in which he appears to have been more indebted to his own application and love of the study than to the instruction of those under whom he successively placed himself for instruction. According to the biographical memoir by his son Giulio, prefixed to the folio volume of his designs (entitled 'Fabbriche e Disegni,' &c., Milano, 1821), he soon became known in his profession, and obtained a great many (moltissime) commissions while he continued at Rome, but none of them are further specified; neither is the precise time stated when he left Italy for St. Petersburg, whither he had been expressly invited by the empress Catherine II. Consequently, for want of that and other dates, the memoir is strangely imperfect, since it gives no chronology of his professional life; neither is it always very clear what designs in the collection have been executed, and what are merely projects. In fact, neither the time of his return to Italy nor even that of his death is stated in the memoir by his son, nor are we able to supply such singular omission any further than in regard to the last event, which happened in 1817.

Though Quarenghi obtained a very high reputation in Russia, his published designs afford very little evidence of superior taste or ability, or even of novelty in invention. Judged from them, he appears to have been a great mannerist, and to have bestowed very little study on his details, which, besides being nearly the same on all occasions, are meagre and poor, even to insipidity. In comparison with many of his countrymen, he may be said to have been pure in his style of composition, but his merits are little more than negative; for if there is nothing glaringly offensive in his productions, neither are they stamped by any particular beauties and merits. Like that of James Wyatt, his purity is for the most part only poverty, his simplicity only the mere antithetical fault to excessive redundancy of ornament. The grandeur of his buildings consists chiefly in their size, and in their being kept in bold masses; but if not broken up, neither are they finished. They have insulated columns and ample prostyles, porticos Ionic or Corinthian, but frequently attached to buildings which are in other respects quite in a state of nudity—bare walls with holes in them for windows. Among his principal works are the Theatre of the Hermitage, the manège or riding-house of the imperial guards in the Isaac's Place, at St. Petersburg, the convent of Demoiselles Nobles, Prince Gagarin's palace, and the triumphal arch in honour of the emperor Alexander, designed by Quarenghi, but not executed in stone till after his death.

QUARLES, FRANCIS, was born in 1592, of a good family in Essex, educated at Christ College, Cambridge, and Lincoln's Inn. Before the Irish rebellion, in 1641, he was Usher's secretary, but at that time he was forced to fly to England, where he met with persecution from the parliamentary party for his attachment to king Charles. Among other things, they plundered him of his books, which is reported to have hastened his death on September 8th, 1644.

His works are now neglected, with one exception, that of his 'Emblems,' which have been many times reprinted, and are sought after by some for their quaintness, by others for their piety. His other works are fifteen at least in number, many of them on scriptural subjects. Quarles had eighteen children, of whom one inherited somewhat of his father's poetical genius, shared the royal fortunes, and died of the plague in 1665.

The quaint conceits of the divines who lived after the Reformation found in Quarle's writings their poetical vehicle. There is much fine feeling, sincerity, and humility shown in many of his compositions, but these qualities do not make up poetry, unless accompanied by a creative power, which is not very traceable in Quarles.

There is a great tendency now-a-days to weigh poetry in the scales of theology, a procedure which implies want of appreciation of the true nature of the art. That our noblest aspirations take the form of religious thought cannot be doubted, but the expression of doctrines, themselves often metaphorical, by coarse corporeal figures conveyed in wood-cuts, is a very different thing from indulging in feelings the very existence of which exalt the character of man. (Chambers's *Biogr. Dictionary*; Quarles's *Poems*.)

QUARRY, an excavation in the ground from whence are extracted marble, stone, or chalk, for the purposes chiefly of sculpture and architecture. The name appears to have been applied to such excavations from the circumstance that the materials obtained from them are there quadrated or formed into rectangular blocks.

Egypt abounds with rocks of calcareous stone, sandstone, and granite [EGYPT]; and all these materials have been employed in the formation of the massive works which yet remain to attest the magnificence of the antient people of that country. The walls of most of the temples were constructed of sandstone, which appears to have been chiefly obtained from the quarries stretching along the banks of the Nile, in the mountains of Silsileh; but the obelisks and statues which adorned these temples are formed of Syenite, or Oriental granite, drawn from the quarries in the islands of Philæ and Elephantine, and particularly from those vast excavations in the mountain terraces about Syene. (On this subject, see 'Egypt. Antiq.,' *Library of Entertaining Knowledge*.) The stone which has served for the pyramid of Cheops is a carbonate of lime, of a light grey colour, and the same kind of stone forms the interior mass of the pyramid of Mycerinus, but the latter is covered with red granite. The monolith at Sais, in the Delta, was formed of a single block of granite, which was floated down the Nile on a raft, from the quarry in Elephantine. (Herod., ii. 175.)

The master-pieces of Grecian sculpture were executed in the rich white marbles of Attica and the islands of the Archipelago. The quarries of Mount Pentelicus near Athens supplied the materials for the Parthenon and the temple of Theseus in that city, and for the temple of Ceres and Proserpine at Eleusis; and both in Greece and Asia Minor an abundance of stone of a greenish white was dug from the earth for the ordinary purposes of architecture. The marble of Pentelicus, which lies on the surface of the rocky mountain, was obtained by cutting the side of the hill into vertical cliffs; and about the foot of the escarpment there still remain some of the blocks of marble partly cut in forms for the shafts of columns. The quarries at Ephesus are said to have constituted an immense labyrinth; and that in the hill Epipolæ, with the stone from which the edifices of Syracuse were constructed, appears to have been of vast extent, since it was capacious enough to contain the 7000 Greek soldiers who had been taken prisoners when the army of Nicias retreated from that city. (Thucyd., vii. 86.) The quarries of the Greeks and Romans were worked by slaves, and as the labour was of a severe kind, we find frequent allusions to the practice of sending unruly slaves to work in the quarries as a punishment.

We learn from Vitruvius (lib. ii., cap. 7) that the buildings of antient Italy were constructed with stones of several different kinds. This writer states that the quarries of Alba and Fidenæ (*Albano* and *Castel Jubileo*) produced a red and soft stone which soon decayed; and that the stone obtained from those of Tibur (*Tivoli*), Amiternum (*Vittorino*), and Mount Soracte, was moderately hard. The Tibertine or Travertine stone is a calcareous rock; and it appears that it was employed in constructing most of the buildings of antient Rome. The quarries in Umbria and Picenum furnished a white stone which could be cut with a saw, and would stand well in situations where it was sheltered from the weather, but was liable to be destroyed by rain or frost. On the other hand, the red stone obtained from the quarries about the Vulsinian Lake (*Bolsena*) on the borders of Tarquinii would stand both frost and fire, and would last for ages; on which account it was generally employed for sculptured works. After the destruction of Rome by fire, in the time of Nero, the houses are said to have been rebuilt of the Alban and Gabian stone, which has the property of resisting the action of that element. The quarries of Carrara, on the north-western slope of the Apennines, have long been celebrated for the fine white marble which is so much employed in the north of Europe for statuary.

The British Isles abound with stone of nearly every different kind that can be employed with advantage in architecture. The quarries of Aberdeenshire are said to supply London annually with 12,000 tons of the best granite, which is employed in that city for bridges, river walls, and every work where strength and durability are most required. The Peterhead granite from the same county takes a beautiful polish, and is frequently employed for columns, chimney-pieces, and other ornamental works. The Grampian Hills in Scotland, the quarries in the county of Dublin, and those of Newry in the county of Down, in Ireland, also produce several varieties of the like material. In England granite is obtained chiefly, and in great abundance, from the quarries in Cornwall, where that material is usually designated Moor-stone. Granite from Aberdeen, from Cornwall, and Devonshire was employed in the construction of the present embankment along the Thames above Westminster-bridge.

Sandstone, both red and white, is obtained in large quantities for the purposes of building, from Yorkshire, Lancashire, and Derbyshire; and the principal edifices in Shrewsbury have been constructed chiefly of the white kind which is furnished by the quarries near Grinshill in Shropshire. A millstone-grit, which is now much used in England, is suppled from Bramley and Hedon in Yorkshire. The red-sandstone is dug from the quarries at Barra, Tranent, and other places in Lothian; from those at Kingudie in Perthshire, and also from Arbroath in Forfarshire. In Ireland it is obtained from the quarries in Tipperary and the county of Cork.

A slate-stone for covering buildings and other purposes is excavated from the Denyhall quarries near Camelford in Cornwall, and from those on the Berwyn range of mountains in Denbighshire. Large slate-quarries have been opened near Bangor in Caernarvonshire, and in the Cumbrian Mountains. Slate-stone is also obtained from excavations near Horsham in Sussex; and there are some quarries of this stone in the counties of Donegal and Kerry.

The stone which may be considered as the most extensively diffused over England and Ireland is that which is denominated limestone, and which, from the facility it affords for working it, is most generally called freestone. It is quarried to some extent in Gloucestershire, Shropshire, Derbyshire, and Oxfordshire, and a grey species is obtained in Yorkshire and Northamptonshire; but the principal quarries of this material are in Dorsetshire and in the country about Bath. Those in Dorsetshire are situated about Kingston in the Isle of Portland, and at Swanwich, or Swanage, in the Isle of Purbeck. The most extensive quarries about Bath are at Combe Down, where the ground has been undermined for several miles. More than 30,000 tons of Portland stone are said to be exported annually to London, where it has been very generally employed from the time that Inigo Jones used it in the construction of the Banqueting-house at Whitehall. It was also extensively used by Sir Christopher Wren in the building of St. Paul's cathedral, the Monument, and most of the public edifices in the city after the great fire which occurred in 1666. It is said however to be not so much used at present as formerly. The stone obtained from Purbeck is of various kinds; some of it, which is capable of taking a good polish, has been used for the pillars of Salisbury and Canterbury cathedrals. It is of a darker colour than Portland stone, and in general it is not so good; the blocks raised from the quarries are also smaller. The material is frequently used as a flag-stone for the steps of buildings and for paving the streets. The hills containing the stone lie in a direction nearly east and west; the beds have a considerable dip or inclination to the horizon, and being covered by a large mass of earth, the men work in quarries under ground. About 40,000 tons of this stone are said to be exported annually.

The stone of Portland and Purbeck constitutes the upper oolite formation of the geologists; and in the former district the quarries are cut through several different beds. The first, or that immediately below the vegetable earth, consists of a cream-coloured limestone, three or four feet deep; and next to it is the *cap-stone*, which is of the same colour, very hard, and about ten feet thick. Below these is a species of rock composed of fragments of oyster-shells cemented together, and still lower is a bed, 5 feet thick, of good white stone. This is followed by a quantity of flint about six feet deep, a second bed of good stone five feet deep, and a thin layer of stones of small value. The best building-stone lies still deeper, and the beds of it vary in thickness from seven to fourteen feet. Underneath all these are masses of flints, extending to the depth of fifty or sixty feet. The best oolite of Purbeck is obtained from the quarry of Wardspit in that district.

The quarries near Bath furnish the stone which bears the name of that town, and which is considered by geologists as belonging to the lower oolite formation. It occurs generally in three beds, of variable thicknesses and different qualities. That in the middle is far superior to those which are above and below it. The depth of the middle bed is in some places as much as thirty feet, and the stone when first taken from the quarry is soft, but it becomes hard after having been for a time exposed to the air. The depth of the upper bed varies from twenty to above fifty feet, and the material is either shelly or argillaceous; that of the former kind appears to have been employed by the Romans for the edifices which they constructed in this part of the country, and it is said to be very durable.

The marble and limestone quarries which were opened near Plymouth in 1812 furnished the material which was used in the formation of the Breakwater at that place; and the stone is stated to have been raised from thence in blocks weighing from one to above five tons. The material selected for the construction of the houses of parliament, now in the course of being built, is an excellent magnesian limestone which abounds in all the tract of country from Durham to Northampton; and that which is actually employed is obtained from several different quarries, principally those near Norfall and Anston in Yorkshire, and near Bolsover in Derbyshire.

Limestone is found in Scotland, where it is occasionally employed for architectural purposes. It is also plentiful in many parts of Ireland; and quarries of this material, of a rich kind, have been opened in Queen's County, and in the counties of Dublin, Meath, and Cork. The limestone district of Kilkenny is famous for its quarries of black marble so much used for ornamental purposes, and good flagstones for paving are obtained at Shawhill in the same county.

The quarries in the Cotswold Hills in Gloucestershire afford in abundance a blue claystone for building; and the best stones for pavements are obtained from those at Ealand or Eland near Halifax in Yorkshire. The quarries near Maidstone, on the south bank of the Medway, produce much of what is called ragstone, a material which is occasionally used in Kent for building, but chiefly in the construction of sea-walls and for paving the roads. Lastly, about Ryegate and Godstone in Surrey is found a soft stone which has the property of withstanding the action of fire, and which, on that account, is much used for chimneys, ovens, and furnaces, but it is scarcely fit for any other purpose.

A valuable table of the principal quarries of sandstone and limestone in England accompanies the 'Report concerning the Qualities of Stone with reference to the New Houses of Parliament' (1839).

QUARRYING, the operation of extracting from the ground, or detaching from the sides of rocks, marble, stone, or other minerals, in considerable masses; generally also this operation is accompanied by a reduction of the masses to rectangular forms.

When the material to be excavated lies vertically below the surface of the ground, the work commences by removing the earth to a depth sufficient to lay that material bare, in order that it may be separated into blocks, and removed; but when the stone, &c. is in the interior, and near the side of a mountain or hill, the workmen proceed as in the operation of mining, running galleries into the ground, and leaving pillars of the material for the support of the mass above them.

A quarry of small extent is opened by sinking vertically in the ground a shaft, into which the men descend by ladders; and the blocks of stone, being separated from the mass, are drawn up by means of ropes, which are worked by a windlass or other machine. In working the larger quarries, the vegetable mould forming the upper surface is removed by the spade; and the beds immediately underneath, generally consisting of rag, or stone of an inferior quality, are broken up by gunpowder or otherwise, and conveyed to a distance. The stones intended for sale, and which are generally in beds much below the surface, are sometimes also detached from the mass by blasting [MINING]; but as by this process the blocks are broken irregularly and the stone wasted, a different method is generally employed. The large mass of stone, as it exists in the quarry, consists of strata contiguous to one another, and the surfaces in contact form planes of *cleavage*; or lines parallel to which the stones being more easily divided than in any other direction, these lines constitute what is called the *cleaving* grain of the material. In order therefore to separate a large block from the mass, a series of iron wedges, placed in line a few inches asunder, on the natural face of the rock, and in the direction of the cleaving grain, are driven into the stone till a part is loosened; a channel is then cut in the direction of the length of the intended block, and at a distance from the natural edge of the stone equal to its required breadth; and wedges being placed in the channel, they are driven by repeated strokes till the stone is split in that direction also. In the hardest stones, the wedges are placed not in the channels, but in what are called *jumper* holes sunk in the direction in which the block is to be severed from the mass. A similar operation is then performed in the direction of the breadth of the block; and thus a large portion is detached from the original mass. (Gwilt, *Rudiments of Architecture*.)

The natural strata of the stone in different quarries are in different positions; frequently they are horizontal, but generally they are inclined to that plane, and sometimes they are vertical; occasionally also both the first and last of these positions are assumed by the stone in the same quarry. It is evident that the separation of the blocks from a mass must be most easily effected when the natural strata are in vertical positions; cutting the stone in directions perpendicular to the line of the grain is always a work of difficulty, and the operations are attended with some danger to the quarrymen when the latter are obliged to work in galleries under ground.

After the blocks have been severed from the mass, they are reduced as nearly as possible to a rectangular form; and this is done by means of a tool called a *kevel*, pointed at one end and flat at the other, with which the irregular parts are knocked off. The blocks are then usually, by means of cranes which are capable of being moved from place to place, raised upon trucks or low carriages; and these are drawn, generally on iron railways, to the quays or wharfs where the stone is put on ship-board. At the slate-quarries in Caernarvonshire the slate are placed on sledges, which, by an engine, are drawn up an inclined plane; and, from the summit of this plane, the stone is drawn by horses to the Menai.

Vitruvius (lib. x., cap. 6) mentions with approbation the following contrivance, which he says was invented by Metagenes, for conveying from the quarry the shafts of the columns and the stones intended to be employed for the architrave in the portico of the temple of Diana at Ephesus. The ground between the quarry and the temple being too soft to allow such masses of stone to be brought up by ordinary wheel-carriages, the architect or engineer covered each extremity of the block of stone with a frame of timber, from the middle of which projected a short axle of iron; this being received in a gudgeon at the centre of a broad cylinder or wheel placed at each end of the frame containing the stone, and oxen being harnessed to the frame, the stone was thus drawn up to the building. Vitruvius also describes an unsuccessful attempt which was made by an engineer named Paconius to bring from a quarry a mass of stone containing about 576 cubic feet. For this purpose, two broad cylinders of wood, 15 feet in diameter, were constructed; and the stone, being raised from the ground, was made to rest between them, the line of its length being in a horizontal position in the direction of their common axis: then a rope being wound round the circumference of the united cylinders in the middle of the length of the latter, and one end of it being made fast to the harness of the oxen, it was intended that, by the motion of the animals, the cylinder should revolve on the ground, and the stone be brought up to its place. The contrivance appears to have failed; but had the oxen been attached to the two ends of the cylinder instead of its middle, there is no reason to doubt that it would have succeeded.

It is right to observe that builders generally consider it advantageous to dispose the stones in the lower part of an edifice in the same position as they had when lying in the quarry; it being understood that they are then best capable of supporting the weight of the superstructure.

QUART, the same word as quarter, but always used (in our language) for the quarter of a gallon. [GALLON.]

QUARTER, the fourth part of anything. The frequency of division into four parts has caused the word to be used sometimes in the sense of a part or portion allotted. Thus the portion of a camp or barrack allotted to one soldier is called his *quarters*.

QUARTER-SQUARES. A table of the fourth part of the squares of numbers may be substituted for one of logarithms in multiplication. For since

$$\frac{(a+b)^2}{4}-\frac{(a-b)^2}{4}=ab,$$

a table which gives the squares of the halves of numbers will, by the addition of the squares of the halves or quarter-squares, give the product. Such a table has been published in France, and is introduced to a certain extent in the late Professor Leslie's 'Philosophy of Arithmetic.'

QUARTER. [HERALDRY.]

QUARTILE, a term of astrology and ancient astronomy. Two bodies are said to have a quartile aspect when their longitudes differ by 90 degrees, or one quarter of the whole great circle.

QUARTZ, the mineralogical name of numerous varieties of rock crystal, the native oxide of silicium [SILICIUM], called also siliceous or flint earth, and silicic acid. It is remarked by Mr. Brooke (*Ency. Metrop.*, 'Mineralogy'), that 'the differences of structure, hardness, specific gravity, mixture with foreign matter, and other characters belonging to this species, are so numerous as to render any single description inapplicable to all its varieties.' Some of the varieties of quartz have been already described; those we shall presently refer to.

Quartz occurs crystallized and massive, and in both states it is widely diffused throughout nature, and is especially one of the constituents of granitic and the older rocks. The primary form of the crystal is a rhomboid, but this is of rare occurrence; it is generally met with in hexagonal prisms terminated by hexagonal pyramids, and when the prism is entirely wanting and both pyramids are present, the crystal is a dodecahedron with triangular planes. Cleavage parallel to the planes and pyramids of the ordinary crystal. Fracture conchoidal. Hardness 7·0. Scratches glass readily, and gives fire with steel. Becomes positively electrical by friction, and two pieces, when rubbed together, become luminous in the dark. Transparent, translucent, opaque. Lustre vitreous, resinous. Specific gravity 2·69 to 2·81. Colourless when pure, but exhibiting a vast variety of colours, of which those mentioned below are the more remarkable.

Quartz is infusible, insoluble in acids in general, but acted on by hydrofluoric acid. It combines by fusion with the alkalis potash and soda, and thus with them acts the part of an acid, and also in many natural compounds; the acid is termed *silicic acid*, and its compounds *silicates*.

The finest specimens of crystallized quartz occur in Dauphiné, Madagascar, &c.; they are found also in Cornwall and near Bristol, of great brilliancy, and are known by the name of Cornish and Bristol diamonds. To enumerate the different places in which this substance occurs would be almost endless. Quartz is composed of one equivalent of silicium = 8, and one equivalent of oxygen = 8; its equivalent is therefore 16.

Hornstone and *Chert* are varieties of compact quartz. Cavernous quartz is termed *Spongiform quartz* or *Swimming stone*, and other quartz varieties have also been described.

Quartz possessing different colours has received various names; some of these we shall briefly notice.

Brown or *Smoky Quartz*. This occurs in fine crystals near Cairngorm in Aberdeenshire. It is used for seals and ornaments when cut and polished. The nature of the colouring matter is not known, but is probably carbonaceous matter.

Purple Quartz, or *Amethyst*, is found both crystallized and massive. It is of every shade of purplish violet, and the colour in the perfect amethyst is pretty equal throughout the crystal or mass; frequently however the summits of the crystals only are coloured. It is used for ornaments.

According to Rose, amethyst consists of

Silica	97·50
Alumina	0·25
Oxide of iron	0·75
	98·50

Amethysts of the finest quality are found in India, Ceylon, Persia, and Siberia. Amethystine quartz of inferior quality is met with in most countries. In Cornwall it occurs in some tin-mines.

Blue Quartz, Siderite, occurs crystallized and massive. It is compact, of a greyish or greenish blue colour. Lustre resinous, waxy. Translucent on the edges. Found near Salzburg.

Green Quartz, found in Peru, in translucent hexagonal prisms. Opaque massive green quartz is called *prase*; the colour appears to be owing to actinodite. It is found in Saxony. *Chrysoprase* is light-green amorphous quartz; it is coloured by oxide of nickel. Found in Silesia and North America.

Yellow Quartz. Transparent. Is of various shades of yellow. Found in Cornwall, Scotland, Bohemia, &c. It is probably coloured by oxide of iron. It has been called Scottish and Bohemian topaz.

Yellow Quartz. Opaque. Ferruginous quartz. Occurs of various shades of yellow and reddish yellow. According to Bucholz, contains 5 per cent. of oxide of iron, to which its colour is owing. Found near Bristol, in Scotland, &c.

Red Quartz, Compostella Hyacinthine Quartz. Colour yellowish or reddish brown. Found in Spain and North America.

Amorphous Quartz. The following varieties of quartz, some of which are intermixed with other substances, have been already mentioned under their respective letters:—AGATE, AVANTURINE, FLINT, FLINTY SLATE, and OPAL. There remain to be noticed

Chalcedony and its varieties. This form of quartz occurs amorphous, botryoidal, stalactitical, reniform, and nodular, but never crystallized: it is frequently met with coating quartz, and occasionally in pseudomorphous cubes. It is of various shades of white, grey, yellow, brown, green, and blue, and the colour is for the most part uniform. It is commonly semi-transparent. Fracture even, sometimes flat-conchoidal. Infusible. Harder than flint. Specific gravity about 2·6.

Chalcedony occurs in most parts of the earth, especially in Iceland and the Faröe Islands, in Ceylon, India, Siberia, Hungary, &c. Trevascus mine in Cornwall has yielded splendid stalactitic specimens; and Pednanrae mine, in the same county, has furnished it of a blue colour.

The following substances have been considered as varieties of chalcedony:—

Heliotrope. Of a dark green colour, spotted with red (Bloodstone). The specific gravity is 2·6. It is found in Silesia, Iceland, &c.; also in the Isle of Rum, Scotland.

Onyx is composed of flat layers or bands of chalcedony of different colours, more especially brown and white. It is the variety especially used for cameos.

Plasma is of a dark green colour, with yellow and whitish dots; it is transparent, and has a glistening lustre. Its specific gravity is 2·04. It is said to occur in Hungary and in Moravia.

Sard is of a brownish yellow colour. Said to be found in Sardinia.

Sardonyx consists of sard and alternate layers of onyx or white chalcedony.

In addition to these, which may be considered as among the purer varieties of quartz, it occurs mixed with variously coloured clays and other extraneous matter, forming different kinds of

Jasper. This occurs opaque, which constitutes one of the most prominent differences between it and agate. Its colours are green, yellow, and red of various shades, rarely blue; these colours are occasionally mixed in spots and irregular veins. Jasper is massive, has often a resinous lustre, but is sometimes dull. It is found on many parts of the Continent, in Cornwall, and in Scotland.

Striped or *Ribbon Jasper* presents green, yellow, and red colours of various shades, sometimes in spots; but the most beautiful variety is composed of equal and parallel stripes of these colours. It occurs in Siberia, the Harz, and Saxony.

Egyptian Jasper, or *Egyptian Pebble*. This occurs in rough roundish masses, and is generally of a brown colour. Internally it is usually of a light colour. It found on the surface to the eastward of Grand Cairo, and on the borders of the Red Sea.

It is well known that siliceous earth assumes other forms besides that of quartz and the varieties of it which have now been described; one of the most useful of these is common sand; and for the important purposes to which silica in its various states is applied we refer to SILICIUM.

QUA'SSIA, a name formed in remembrance of a negro named Quassy, who first made known the medicinal virtues of one of the species, is a genus of plants belonging to the Simarubaceous order. Linnæus referred to it several other species, but the most recent botanical writers confine the genus to one, the original source of the bitter drug now commonly sold in Europe. For general purposes it will be most convenient to consider the genus in the same way as Linnæus.

It consists then of trees inhabiting the tropical parts of South America, particularly Surinam and the adjoining countries. They have leaves pinnated like those of the common ash, flowers with a small 5-parted calyx, 5 petals, a definite number of hypogynous stamens, and a fruit consisting of five dry or fleshy drupes.

Quassia amara, the true Quassia of modern botanists, is a small tree, with its leaflets in two pairs, with an odd one, and a winged jointed leafstalk. Its flowers are scarlet, large like those of the red American Horsechesnut, and arranged in narrow racemes. It inhabits the woods of Surinam, Demerara, and probably the greater part of Central America. The wood of the root of this plant was formerly in great repute as a stomachic and as a remedy for the malignant endemic fevers of Surinam. The flowers also were and still are, in that country, infused in wine or spirits, and form a bitter beverage, but the wood is out of use, in consequence partly of its being less easily procured than that of the next species, and partly from an opinion being entertained of some bad properties existing in connection with the intense bitter.

Quassia excelsa, the *Picræna excelsa* of Lindley, is a large tree inhabiting Jamaica. It has oblong, acuminate, obtuse leaflets, in from four to eight pairs, and panicled, corymbose, small pale yellowish-green flowers. This tree yields the Quassia *chips* now so extensively employed in Europe as a bitter substance. The wood is imported from Jamaica in billets of various sizes, is white, scentless, but most intensely bitter. It is one of the ingredients employed by fraudulent brewers in adulterating beer.

Quassia Simaruba, the *Simaruba amara* of Aublet, is the plant which furnishes the *bark* called Simarouba, which comes from Jamaica in bales, and is used as a tonic, although it also appears to act as an emetic. It is a large tree, found in the West India Islands and on the mainland of America. Its leaflets are two to nine on each side, oval, smooth, firm, and sharp-pointed. The flowers are very small, whitish, and arranged in branching scattered panicles.

The three genera, *Quassia*, *Picræna*, and *Simaruba*, may be distinguished thus:—

Quassia. Petals forming a tube. Stamens 10. Flowers hermaphrodite. Ovaries 5.

Picræna. Petals quite distinct. Stamens 5. Flowers polygamous. Ovaries 3.

Simaruba. Petals quite distinct. Stamens 10. Flowers unisexual. Ovaries 5.

QUA'SSIA. The wood of two different trees is known in commerce by this name: one, formerly very common, but now extremely rare, is obtained from the Quassia amara (Linn., f. supp. 235, and Woodv., t. 77), a native of Surinam, Guayana, &c.; the other, Picræna excelsa, Lindley (Quassia cuba, Swartz), is a native of Jamaica. Both kinds are imported in billets, sometimes a foot in diameter and several feet long; but before being used for medicinal purposes, they are cut into chips, which are of a light grey colour, or, by long exposure to the air, of a yellow or brownish hue. The physical characters of the two sorts are so similar, that it is difficult to distinguish them; but a watery infusion of the Surinam Quassia by permuriate of iron is only rendered turbid, with greyish flocculent pieces floating in it, while that of the Jamaica Quassia is rendered black by the same re-agent. Both are devoid of odour, but possess an intensely bitter taste, which is stronger but more disagreeable in the Jamaica Quassia. This property at once distinguishes Quassia from any other wood which may be substituted for it. The active principle seems to be *quassite*, a neutral body, which crystallizes in white prisms, and is readily soluble in alcohol. It has a poisonous influence over many of the lower animals, and perhaps even over very susceptible individuals of a higher grade.

Quassia is regarded as a pure and simple bitter, possessing tonic properties of a very marked kind; and hence it is useful in many forms of debility, particularly of the stomach and muscular system. It is generally given in the form of infusion, which serves as a convenient vehicle for some of the preparations of iron, especially the protosulphate and the phosphate. The Jamaica Quassia ought not to be employed as a vehicle for the permuriate of iron, as an inky fluid, instead of a clear transparent one, is the result. The want of aroma may be obviated by adding to the infusion a portion of the compound tincture of Quassia (*Pharm. Edin.*), which renders it more grateful and more beneficial.

Infusion of Quassia, sweetened with sugar, is useful to destroy flies, and is much safer than the fly-waters made of king's yellow or orpiment, a poisonous compound of arsenic; for should children or others drink the infusion, improved appetite would be the only result, whereas death is the frequent consequence of drinking the arsenical fly-water.

QUATRE VALLÉES, LES, a district in the department of Hautes Pyrénées, comprehending the four valleys (whence the name) of Aure, Barousse, Magnoac, and Neste. The air of the district is cold but healthy; the land is chiefly pasturage or woodland. The woods yield timber for the builder and shipwright. Castelnau de Magnoac was accounted the chief place. The district anciently belonged to the county of Armagnac, a subdivision of Gascogne. [Armagnac; Guyenne and Gascogne.]

QUEBEC, the capital city and seat of government of the province* of Lower Canada, is situated on the river St. Lawrence, about 400 miles from its mouth, in 46° 49′ N. lat. and 71° 13′ W. long. The population is 27,562.

Jacques Cartier touched at Quebec in 1534, and found an Indian village there. The country was neglected by the French for more than half a century, and it was not until the year 1608 that Samuel de Champlain founded the city of Quebec. An English force under Sir David Kirke captured the place in 1629, but it was restored to France in 1632.

In 1759 a squadron under Admiral Saunders conveyed some troops commanded by General Wolfe to besiege Quebec. They landed on the island of Orleans near Quebec, on the 27th of June, and commenced their attacks on the French lines on the side of Montmorenci; but the dispositions of the French troops made by the Marquis de Montcalm were so skilful that all their efforts proved unavailing, and Wolfe in his dispatches expressed a doubt whether he could reduce the place in that campaign. He resolved however to endeavour to effect a landing above Quebec, which was performed in the night, and on the 13th of September the British army appeared drawn up on the plains of Abraham. The French sallied forth to meet them, and after a bloody battle, in which both armies lost their commanders, the English were victorious. Quebec capitulated on the 18th, and, with the rest of the French possessions in North America, was finally ceded to Great Britain at the peace of Paris in 1763. In 1775, during the American revolutionary war, Generals Montgomery and Arnold attempted to carry Quebec by assault on the night of the 31st of December, but were repulsed, and Montgomery fell.

Quebec is situated on a promontory formed by the confluence of the river St. Charles with the St. Lawrence, at the north-east extremity of an elevated but narrow table-land, which for about eight miles forms the left bank of the St. Lawrence. Cape Diamond presents a nearly precipitous face to the St. Lawrence; the descent to the St. Charles is more gradual. The height of the platform of the citadel of Quebec, which stands on Cape Diamond, is 332 feet 3 inches above the St. Lawrence. The distance from one river to the other across the ridge is rather more than a mile. The St. Lawrence abreast of the town is only 1314 yards wide below the point, the basin is above 1½ miles in width, and the tide rises 25 feet. Quebec is situated at that part of the river where the St. Lawrence suddenly contracts in breadth, and is said to take its name from the Indian word *kebec*, which signifies 'narrow.'

Quebec is divided into the upper and lower towns: the lower town, which is the seat of commerce, is built round the base of the promontory, where in many places the rock has been removed to make way for the houses, which are ill built and irregular, and the streets narrow and badly paved. The Custom-house and Exchange reading-room, where all newspapers and periodicals are taken in, and which possesses an extensive library, are in the lower town. The ascent to the upper town is either by a narrow and steep winding street, or by a flight of steps. The upper town has a northerly aspect, and is well ventilated; the streets are rather narrow, but tolerably well paved. All public buildings and many private houses are roofed with tin or iron, which retain their brightness many years, and produce a very striking effect. The citadel which crowns the summit of Cape Diamond is strongly fortified, and covers about 40 acres of ground. A wall, mounted with heavy ordnance, surrounds the upper town, which has five gates strongly defended. The citadel contains a very extensive armoury. The Château of St. Louis, the residence of the governor-general, was accidentally burnt during the winter of 1834-5. The Protestant cathedral is a plain modern edifice with a spire; the court-house is close to it. The parliament-house, which was formerly the palace of the bishops of Quebec, stands over the gate leading from the lower town; it is the only public building which has any pretensions to elegance. The Catholic cathedral is a large building with a heavy dome and spire. In the market-place stands the Jesuits' college, now a barrack, a very spacious building, said to be capable of accommodating 2000 soldiers. There are three nunneries, the Ursuline, Hôtel Dieu, and Hôpital Général. The Quebec library contains above 6000 volumes of valuable and standard works. The garrison also possesses a good library. There are a Literary and Historical Society, incorporated by royal charter in 1829; there are also a Committee of Trade, benevolent and friendly societies, a Royal institution, a classical school instituted in 1836, Bible and Missionary societies, and a Mechanics' Institute established in 1830.

In 1832 there were 78 free schools in Lower Canada under the Board of Royal Institution, incorporated for the advancement of learning by the Provincial Act, 41 Geo. III., c. 17, of which board the bishop is the principal. To this board the legislature made an annual grant for the support of these schools. The act providing for the support of these schools, not having been renewed by the provincial legislature, expired May 1, 1836, and the schools have consequently ceased for want of funds. There is a grammar-school at Quebec supported by an annual allowance of 200*l*., and 90*l* for a house, from the revenues of the Jesuits' estates. This is under the same board. The mode of instruction is that followed in the grammar-schools in England. The Lancasterian method has been adopted in a few schools. There are several Roman Catholic schools.

Quebec is the seat of a Protestant and a Roman Catholic bishop. The cathedral, which is used likewise as a parish church, will contain about 1600 persons; there is a chapel within the walls, also one in St. John's suburb, one in St. Roche, and one in Wolfe's Cove. There are two Scotch churches and two Dissenting chapels in Quebec. The clergy are supported by salaries from the Society for the Propagation of the Gospel in foreign parts, and one-seventh of the lands in the townships. The Catholic church is richly endowed with lands and tithes. There are a chief justice and three judges of the Court of Queen's Bench, from whence an appeal lies to a court composed of the governor, executive council, chief justice, or any five of them, excluding the judge from whose judgment appeal is made.

The corporation of the Trinity House was established by act of the Provincial Parliament. (45 Geo. III., c. 12.) The following are the rates of pilotage between Bic and Quebec.

* [illegible] the two provinces of Upper and Lower Canada are [illegible].

a distance of 160 miles, for every foot of water which the vessel draws:—

„ November 19 to March 1	1 8 0	1 5 9

The winter lasts from November to May; during December, January, and February, the thermometer usually ranges from freezing-point to −25° Farenheit. The river is frozen across at Quebec about once in ten years. During summer the range of the thermometer is from 60° to 90°, and the mean of the summer is about 68°.

The following newspapers are published at Quebec:—'The Quebec Gazette' (by authority), weekly, in English and French; 'Neilson's Quebec Gazette,' daily, alternately English and French; 'Quebec Mercury,' three times a week, English; 'Le Canadien,' three times a week, French.

Accounts are kept in Halifax currency, four dollars being equal to one pound. To change currency (Halifax) into sterling, deduct one-tenth.

The chief circulating medium is in notes of the colonial banks; there is no colonial currency, the coin in circulation being that of the United States, France, and Spain, rated above its real value. The banks established in Quebec are, the Quebec bank, which has notes in circulation to the amount of near 70,000*l.*; a branch of the Montreal bank; a branch of the bank of British North America; and the Quebec savings' bank, established in 1831.

The old English and French weights and measures are in use. Troy weight is used for gold and silver, precious stones, and drugs; avoirdupois for all other articles. The Canada minot, used for all grain, is about one-twentieth larger than the imperial bushel. The English yard is used for all cloths, stuffs, &c., and the Paris foot for measurements of land or length, unless otherwise specially agreed upon.

The gaol of Quebec is capable of containing 54 prisoners in separate cells; and 158 when more than one prisoner is confined in the same cell: the greatest number of prisoners at one time, in 1837, was,—

(M'Gregor's *British America; Parliamentary Papers relating to Affairs of Canada; Statistical Returns* made by Board of Trade.)

QUEDLINBURG was the territory of an antient abbey founded between 932 and 936, by the German king Henry I.; it was situated between Halberstadt and Anhalt, and was about 42 square miles in extent, with a population of 15,000 inhabitants. The abbess (after 1539, a Protestant) was an estate of the Empire, and had a seat and vote in the bench of prelates of the circle of the Rhine. The

* The eagle coined before 1834 is worth 2*l.* 15*s.*

bess enjoyed the nominal sovereignty of the territory, yet most of the rights of sovereignty were exercised by the elector of Saxony, and then by the elector of Brandenburg, afterwards king of Prussia, who in 1697 bought of Saxony, for 300,000 dollars, the dignity of hereditary bailiff, and a claim to the bailiwicks of Lauenburg, Sevekenburg, and Gersdorf. He had a garrison in the town, had the excise and other taxes, received the oath of allegiance, and had a governor to attend to all these matters, who was immediately under the superior boards of Berlin. The abbess however had her exchequer, her consistory, &c. The last abbess, appointed in 1787, was Sophia Albertina, sister of Charles XIII., king of Sweden. On her decease, at the diet of the empire in 1802, the abbey with its territory was secularised, and assigned to the king of Prussia. In 1807 it was added to the kingdom of Westphalia, but in 1814 again taken possession of by Prussia, and annexed to the circle of Aschersleben, in the government of Magdeburg, in the province of Saxony.

QUEDLINBURG, the chief town, is situated on the river Bode, which divides it into two parts, the old and new town; besides these two parts, there are three suburbs. This town has a gymnasium, six hospitals, several schools, and eight churches. In the suburb Westendorf, upon a high rock, are the buildings of the ancient abbey, with the handsome abbey church, built by Henry I., which contains a library, and the tombs of Henry I. and his queen Matilda. The population of Quedlinburg at the last census in 1837 was 12,993 inhabitants. They have woollen and linen manufactures, very great distilleries and breweries, and carry on a considerable trade in cattle, corn, garden fruit, as well as the products of their distilleries, breweries, &c. Quedlinburg is the birthplace of Klopstock, the author of 'The Messiah,' the 100th anniversary of whose birth was commemorated by a fête on the 2nd of July, 1824. The town is situated in 51° 48′ N. lat. and 11° 7′ E. long., 30 miles south-south-west of Magdeburg, and 10 miles south-south-east of Halberstadt.

(Hassel; Stein; Fritsch, *Geschichte des Hochstifts und der Stadt Quedlinburg*, 2 vols., 1829.)

QUEEN. The Saxon *cwen*, which being used to denote *mulier*, *femina*, *conjux*, as well as the most distinguished of women and wives, in whom now it is only appropriated, we are guided at once to the original use of it as betokening the wife or consort of the king. The other use of it, as betokening a sovereign princess, one who reigns in her own right, and possesses all the rights and functions which belong to a male person who has succeeded to the kingly power in a state, is therefore an application of it which was not originally contemplated.

The king's consort has been regarded in all countries as a person of eminent dignity, and has been invested with privileges which have not been allowed to any other married woman. In England she can purchase lands, and take grants from the king her husband; she has separate courts and officers, including an attorney and a solicitor general; she may sue and be sued apart from her husband, have separate goods, and dispose of them by will. She pays no toll, is not subject to amercement, has a share in fines made to the king for certain privileges, which last is called queen's gold. Anciently manors belonging to the crown were assigned to her in dower, but now the provision for her is made by a parliamentary grant at the time of marriage. Again, there is thrown over her person a peculiar protection. It is as much treason to compass or imagine the death of the king's consort as of the king himself. To violate or defile her person is also treason, though she be consenting. It has been the usual practice to crown the queen with the same kind of solemnities as are used at the coronation of a king. In the case of Caroline, the consort of King George IV., who was living at the time apart from her husband, this was not done; but her right was most ably argued at the time by Mr. Brougham before the privy-council.

The chief distinction between a queen dowager and the widow of any other person of eminent rank lies in this, that though she marry with a commoner, she does not lose her rank; but no one can marry a queen dowager without special licence from the king.

A queen regnant, or princess who has inherited the sovereign power, differs in no respect from a king as to the political rights vested in the dignity.

QUEEN BEE. [Bee.]

QUEEN CHARLOTTE'S ISLANDS, also called the Archipelago of Santa Cruz, are a group of islands in the Pacific, north of the New Hebrides, between 10° and 12° S. lat., and 165° and 168° E. long. These islands were discovered in 1595 by Mendana, but were not visited until Carteret found them again in 1767. The archipelago consists of five or six islands of moderate extent, and a great number of smaller ones. Some of these islands are surrounded by extensive coral-reefs. The largest is the island of Santa Cruz, called by the natives Nitendi, which is above 20 miles long from east to west, and about half as wide. On the north-western shore of it is Trevanion Lagoon, a fine round harbour, though small. The other islands are *Gloria*, Tulua, Lord Howe, Mallicolo, and Volcano: the last has an active volcano. The larger islands and some of the smaller are elevated, and apparently of volcanic origin, but most of the latter are low. They are well wooded, and very populous. They produce the cocoa-nut, the bread-fruit, and all the products of the Friendly Islands and New Hebrides. The inhabitants belong to the race of the Austral negroes, but are less savage than those of New Britain and Papua: they have large canoes. It would seem that there has been a mixture with Malays. They are very good-natured, but inclined to theft. They go almost entirely naked. It was on the island of Mallicolo, called by the French Wanicoro, that La Pérouse was wrecked and lost with his crew. [Pérouse.]

(Carteret's *Voyage round the World*; Dumont d'Urville, *Voyage autour du Monde*; Krusenstern, *Mémoires*.)

QUEEN CHARLOTTE'S SOUND is the long strait which separates the large island of Quadra and Vancouver from the continent of North America. It is supposed to be nearly 300 miles long, but the southern extremity towards Juan de Fucas strait is imperfectly known. The northern extremity, which was surveyed by Vancouver, lies between 51° and 52° N. lat. and 127° and 128° W. long. The shores of this strait, which in many places is narrow, are high and rocky, and indented with numerous deep inlets; they are overgrown with tall forest-trees. (Vancouver's *Voyage of Discovery to the North Pacific Ocean*, &c.)

QUEEN CHARLOTTE TOWN. [Prince Edward's Island.]

QUEEN'S COLLEGE, CAMBRIDGE, was founded by Margaret of Anjou, consort of King Henry VI., in 1446; and refounded by Elizabeth Widville, consort of King Edward IV., in 1465. King Richard III. gave the college all the forfeited estates of John Vere, earl of Oxford, but the grant was annulled on the accession of King Henry VII., who restored the whole to the earl. The greatest benefactors to the college in later times have been Ferdinando Smythes, a fellow, who gave the sum of 1300*l.* for the use of three bachelors of arts till the time of taking their master's degree, and Mr. Hughes, a vice-president, who bequeathed the residue of his property, amounting to about 2000*l.*, to the college.

The president of Queen's College must be elected by a majority of the whole existing body of fellows on the eighth day after a vacancy, and must be at least a B.D. He must also be possessed of property to the amount of 20*l.* per annum, if he is not a fellow at the time of his election.

There are nineteen foundation fellowships in this college. All the fellows within four years from commencing B.A. must proceed to M.A.; those who are on the ecclesiastical foundation must within two years from M.A. be in holy orders, and within nine years from M.A. proceed to B.D. Only two fellows may remain laymen, who proceed to M.A. like the rest, and within twelve years from M.A. the one must proceed to LL.D. the other to M.D. The vice-president and the five seniors hold their fellowships with property; the others recede from the society when possessed of a real annual income stated in the oath before admission. The five senior divines may hold livings not exceeding 20*l.* per annum, and within twenty miles of Cambridge. On the petition of the society the crown has frequently dispensed with some of the above restrictions. A bye-fellowship was founded in 1698, by D. Edwards. This fellowship is perfectly open, may be held by a layman, and is tenable with any property or preferment, except ecclesiastical to a certain amount.

The scholarships of this college, which were consolidated some years ago, have been again consolidated and augmented by college grants; and it has been agreed by the president and fellows that there shall in future be fifteen scholarships tenable till B.A., two of which shall be 20*l.* a year, two of 40*l*., and eleven of 15*l*. They are in the appointment of the president and fellows present.

There are also two Stoke's scholarships, of 15*l*. per annum, to be given to chapel-clerks; two Sedgwick's scholarships, average 15*l*. per annum, capable of increase to 20*l*., but subject also to diminution; sons of poor clergymen to be preferred; and one Clarke's scholarship and librarianship of 15*l*. per annum. Sedgewick's and Clarke's scholarships are in the sole appointment of the president.

Among the eminent persons who have been educated at this society may be reckoned Sir Thomas Smith, afterwards provost of Eton, John Weever, author of the 'Funeral Monuments,' Dr. Thomas Fuller, Bishop Patrick, and Dr. John Wallis, the mathematician. Erasmus, who is said to have studied also at St. Mary Hall, in Oxford, resided for some time in this college. There is a portrait of him in the College Hall. [ERASMUS.]

The benefices in the patronage of this college consist of the rectories of Bowbrickhill, in Bucks; Eversden parva, and St. Botolph's Cambridge, in Cambridgeshire; Sandon, in Essex; Seagrave, in Leicestershire; Grimston, Rockland, and South Walsham, in Norfolk; Hickling, in Nottinghamshire; and Newton Toney, in Wilts; with the vicarage of Oakington, in Cambridgeshire.

The statutes have been printed for the use of the society. Copies in manuscript exist in the University library, MS. Baker xxxii., p. 241, and in the British Museum, MS. Cole, vol. xlvii., p. 357. Questions have sometimes arisen on the construction of the statutes of this college, and have been decided by the Lord Chancellor, acting on the behalf of the crown, as visitor. (Jacob's *Reports*, p. 1; Russell's *Reports*, vol. v., p. 64.)

The present number of members of this society is 341.

Queen's College is situated to the west of Catherine Hall, on the banks of the river Cam, and consists of two courts, built of brick. The chapel has been modernised.

(Lysons' *Mag. Brit. Cambr.*, pp. 117, 118; *Camb. Univ. Calendar*, 1840.)

QUEEN'S COLLEGE, OXFORD, was founded in 1340, by Robert Egglesfield, rector of Burgh or Brough, in Westmoreland, and confessor to Philippa, queen of Edward III., for a provost and twelve fellows (since increased to sixteen), to be chosen from the counties of Cumberland and Westmoreland. The founder was himself a native of Cumberland. The church of Brough was appropriated to the college by Pope Clement VI., in 1344. Egglesfield gave his foundation the name of Queen's College, probably implying that the queen had been instrumental in promoting his work, and had taken it under her protection. He died in June, 1349.

Eight fellowships and four scholarships, open to natives of any county or place, and four exhibitions confined to the province of Canterbury, have been since founded in this college, in pursuance of the will of John Michel, Esq., of Richmond, in Surrey, who bequeathed lands in Kent and Berkshire for that purpose.

The following exhibitions have been added by other benefactors:—Six of 60*l*. per annum, by Sir Francis Bridgman, for the counties of Lancaster, Chester, or Wilts; five of 100*l*. per annum, by Lady Elizabeth Hastings, for natives of any counties, coming from certain schools in Yorkshire, Westmoreland, and Cumberland; two of 20*l*. per annum, by Frederick Tylney, Esq., for natives of Hampshire; four of 10*l*. per annum, for natives of Wiltshire and Gloucestershire; two of 40*l*. per annum, founded by Dr. Thomas, bishop of Rochester, for the sons of clergymen of the diocese of Carlisle, and educated at the schools of Carlisle and St. Bees; one of 60*l*. per annum, for natives of Middlesex, by Keane Fitzgerald, Esq., a member of the college; and a few others of small value, appropriated to the probationary scholars.

Among a long series of benefactors to this house, who increased its revenues by money, lands, or church livings, we find the names of John de Hotham, one of the early provosts, Sir John Stanford, Thomas Beaufort duke of Exeter, Cardinal Bainbridge, Archbishop Grindal, the founder of St Bees School in Cumberland. In 1626, Charles I., at the request of his queen, gave the college three rectories and as many vicarages in the county of Southampton.

The patronage of this college upon the old foundation consists of the rectories of Sulhamstead Abbas and Sulhamstead Bannister, with the vicarage of Sparsholt, in Berks; the rectory of Holwell, in Dorsetshire; the vicarage of Cheddworth, in Gloucestershire; the vicarage of Bramley, the rectory of Bramshot, the vicarage of Carisbrooke, the rectory of Enham, the curacy of Upton Grey, the vicarage of Godshill with Nighton rectory, the rectory of Hedleigh, the vicarage of Milford with Hurdle, the rectory of Newnham with the chapel of Mapledurwell, the rectory of Oakely, the curacy of Pambar, the vicarage of St. Cross, alias Holy Rood, Southampton, and the rectory of Wey Hill in Hampshire; the rectories of Bletchingdon, Charlton on Otmoor, Hampton Poyle, and South Weston, in Oxfordshire; the vicarage of Newbold Pacey, in Warwickshire; and the vicarage of Burgh or Brough, already named, in Westmoreland.

The patronage on Michel's, or the new foundation, consists of the vicarage of St. Wendron with the chapelry of Helston, in Cornwall; the rectory of Bicknor English, in Gloucestershire; the second portion of Pontesbury, in Shropshire; and the rectory of Upton Scudamore, in Wilts.

The visitor is the archbishop of York.

The present buildings of this college consist of two spacious courts, divided by the hall and chapel, and compose an oblong of three hundred feet in length and two hundred and twenty in breadth.

The foundation stone of the first or south quadrangle was laid by Dr. William Lancaster, then provost, on February 6, 1710; but it was not finished till 1759. In 1733 Queen Caroline gave 1000*l*. towards completing this quadrangle: the design is attributed both to Hawksmoor and Wren. [HAWKSMOOR.] Over the gate of entrance from the High Street, on the south side, is a statue of Queen Caroline, under a cupola supported by pillars.

The library, on the west side of the north court, was begun in 1692, and the outside finished in 1694. The present chapel, the foundation of which was laid in 1714, was dedicated on All Saints' Day, 1719; it is a hundred feet long by thirty. Besides several windows painted by Van Linge, in 1636, and four older windows, all brought from the former chapel, it has a representation of the Ascension on the ceiling, by Sir James Thornhill, and in the middle window, at the east end, the Holy Family, on glass, by Price.

Among the more eminent persons educated in this college have been Cardinal Beaufort, King Henry V., Bainbridge, cardinal and archbishop of York, Bernard Gilpin, Sir Thomas Overbury, Burton the antiquary, Compton bishop of London, Bishop Nicolson, Gibson bishop of London, Archbishop Potter, Tanner bishop of St. Asaph, Hyde the orientalist, Dr. John Hill, Edmund Halley, Addison, Tickel, Dr. John Hudson; Edward Thwaites and Christopher Rawlinson, the Saxon scholars; Shaw the traveller, the poet Collins, and Dr. Richard Burn, author of the well known works on 'The Office of a Justice of the Peace' and 'Ecclesiastical Law.'

The number of members upon the books of this college, December 31, 1839, was 292.

(Chalmers's *Colleges and Halls of Oxford*, vol. i., p. 88-106; *Oxford Univ. Calendar*, 1840.)

QUEEN'S COUNTY, a county of the province of Leinster in Ireland, bounded on the north-west and north by King's County, on the east by the county of Kildare and a detached portion of King's County, on the south-east by the county of Carlow, on the south by that of Kilkenny, and on the south-west by that of Tipperary. This county is comprehended between 52° 45′ and 53° 13′ N. lat., and between 6° 54′ and 7° 47′ W. long. Its greatest length is from east by south to west by north, from the bank of the river Barrow, opposite the town of Carlow (in Carlow county), to the neighbourhood of Roscrea (in the county of Tipperary), 37 English miles: its greatest breadth, at right angles to the length, is from the neighbourhood of Killeigh, a village in King's County, between Tullamore and Portarlington, to the junction of the three counties, Tipperary, Kilkenny, and Queen's, 33 miles. The area is estimated at 476,181 English acres, or 744 English square miles (*Population Returns*; and *Map of Ireland*, by the Society for the Diffusion of Useful Knowledge): it was given by Dr. Beaufort, in 1792 (*Memoir of a Map of Ireland*), at 378,023 acres, or about 590 square miles; and by Mr. Wakefield, in 1812 (*An Account of Ireland, Statistical and Political*), at 602 square miles. The population, in 1831, was 145,851, giving 196 inhabitants to a square mile, upon the statement of area given in the 'Population Returns.' Among the counties of

Leinster. It is the second in respect of size, the fifth in respect of number of inhabitants, and the eleventh for density of population, being inferior in this respect to all except Kildare. Indeed both in amount and density of population it is inferior to most Irish counties. Maryborough, the capital, is on the road from Dublin by Kildare to Limerick, about 42 or 50 miles in a direct line south-west of Dublin.

Surface, Geological Character, Hydrography, and Communications.—Two principal groups of hills traverse the county. The Slieve Bloom, or Bloom Mountains (part of the range of highlands which separates the basin of the Shannon from the basins of the Barrow and the Suir), occupy the north-western part of the county, and in one part separate it from King's County. Portions of this group, which has its greatest extension from south-west to north-east, are respectively known as Carrickdawn Mountain, the Glendine Mountains, and Capard Mountain. The northern slope of the Slieve Bloom is more fertile than the southern, which is chiefly waste, and covered with heath. These hills have sometimes been called 'the height of Ireland,' from an erroneous supposition that they were the loftiest in the island. They are traversed on the border of the county by a narrow defile, the pass of Glendine, which forms the only communication in this part between this and King's County. The Dysart Hills occupy the south-eastern part of the county, and separate the valley of the Barrow from that of its tributary the Nore. They are situated in the best wooded part of the county, to the picturesque appearance of which they much contribute: they do not form a continuous ridge, but consist chiefly of isolated hills. The rest of the county is flat, or varied only by gentle undulations.

The greater part of the county is included in the limestone district, which overspreads so large a part of Ireland. The Slieve Bloom are composed chiefly of sandstone, and a portion of the Dysart Hills is formed by the coal-measures. The coal-field extends from this county into the adjacent county of Kilkenny, and there are several coal-pits in each. The coal-field occupies a basin in the limestone formation, by which it is surrounded on every side. The coal burns with little flame; but it consumes slowly, and sends out a strong heat: it is excellent fuel for malting, and also for forges and other iron-works, but not well adapted for domestic use. Its price places it above the reach of the poor of the vicinity. Iron, copper, and manganese are found, but not worked: ochre, fullers' earth, and potters' clay are also met with: the last is employed in making tiles, garden-pots, and other coarse earthenware. Sandstone of a soft texture, suited for hearth-stones and chimney pieces, and slates, are quarried. Limestone is quarried in almost every part, and marble in a few places.

The county is for the most part comprehended in the basin of the Barrow; but a small portion on the north and a yet smaller portion on the west side belong to the basin of the Shannon. The Barrow rises in the Slieve Bloom, and has a winding course, first north, and then east, to the border of the county, a little above Portarlington: it then continues its course eastward, forming the northern boundary of the county (which it separates from King's County and Kildare county) until it reaches Monasterevan in Kildare. From Monasterevan the course of the stream is southward, and it forms, except just about the town of Athy (in Kildare county), the eastern boundary to the neighbourhood of Carlow, just below which it quits the county. Its whole course in this county and on the border is about 55 miles: it is navigable from Athy, about 40 miles from its source. It receives several small tributaries on its right (or Queen's County) bank, also several on the left (or King's County, Kildare, and Carlow) bank.

The Nore does not fall into the Barrow till long after it has quitted this county: it rises in the adjacent county of Tipperary, enters Queen's County on the south-western side, not far from Borris-in-Ossory, and flows first north-eastward, then eastward, to Castletown. Below Castletown it turns to the south-east and flows to the border of the county, which, before finally quitting it, it separates for a short distance from Kilkenny county. That part of its course which belongs to this county may be estimated at 25 miles. It receives the Tonnet and several other small tributaries on the left bank.

The Lower or Little *Brosna*, or Brusna, which joins the Shannon below Banagher, rises just within the western boundary of the county; and the Clodagh, whose waters fall into the Brosna, which also joins the Shannon above Banagher, rises within the northern boundary.

The only lake is Lough Annagh, on the northern border of the county; it does not exceed a mile in length: a stream which flows from it at its south-western extremity joins the Shannon. Bogs are numerous in the central part of the county, between the Slieve Bloom and the Dysart Hills.

A branch of the Grand Canal enters the county at Monasterevan, at its north-eastern corner, and there divides into two branches, one of which runs westward about twelve miles to Mount Mellick; the other, known as the Athy Canal, runs twelve miles southward to Athy, just below which town it joins the Barrow: this latter branch is partly in Kildare county.

Two railways have been projected, which will have part of their course in this county; one from Dublin to Kilkenny, which will follow the right bank of the Barrow, and another from Dublin to Limerick, which will run nearly parallel to the present coach-road.

The principal roads are as follows:—the road from Dublin to Limerick by Kildare and Roscrea crosses the county from north-east to south-west, passing through Monasterevan (Kildare county), Ballybrittas or New Britain, Maryborough, Mountrath, and Borris-in-Ossory. The road from Dublin by Athy and Cashel to Cork passes through Stradbally, Ballyroan, and Abbeyleix. Other roads are numerous, but of less importance: those to the market towns are generally well laid out, and in good condition; but some of the cross-roads and those in remote parts are bad.

Soil; Agriculture; State of the Peasantry.—Almost every kind of soil is found in the county, from a very stiff clay to a very light sandy but fertile loam. There are extensive tracts of bog, and a good deal of cold wet ground, especially near the mountains. Mr. MacCulloch, who gives the area of the county at 396,810 acres, states that 335,838 are in cultivation, and 60,972 are uncultivated mountain or bog. (*Statistical Account of the British Empire.*) Considerable part of the waste might be reclaimed with great advantage; but the poverty of the tenantry, and the absence of any material assistance from the landlords, prevent this improvement. The same causes prevent also the draining of a considerable quantity of land which, though under cultivation, is comparatively unproductive for want of this improvement, as well the building of farm-houses and other erections, and making fences and roads, the cost of which is generally left to the tenant. The consequence is, that the farm-houses and out-buildings are insufficient, and are usually out of repair, damp, dirty, and miserable. (*Appendix to first Report of Commissioners for inquiring into the Condition of the Poorer Classes in Ireland; Parliamentary Papers for* 1836, vol. xxxiii., p. 385.)

Some improvements have however been made by the more judicious proprietors. The demesne of one of these (in the barony of Portnehinch) 'exhibits some extremely interesting improvements in reclaiming bog-land, which have been effected under the directions of his steward. These improvements are in every stage of progress, from the cutting of the first ditch through the shaking and worthless bog, to its conversion into fine productive land. One field, which between four and five years ago was a quaking bog, in which no stock could be put, even in the driest weather, without danger of being mired, is now perfectly sound, and feeds heavy cattle. It produced this year a fine crop of hay. The first crop (turnips) which was taken after the draining was completed, paid the whole expense of the improvement. Another field, which was only drained three years ago, and was previously not worth one shilling per acre, has since produced fine crops of turnips and oats, and after giving this summer three tons of hay to the acre, is now, in October, carrying a large stock of fattening cattle and sheep. The bog-land is intersected at every 40 to 60 feet by deep drains made with stones, from six to ten inches in diameter. The cost of this is about 3*l.* 10*s.* or 4*l.* per acre, and it cost about 2*l.* more for the clay and other condensing materials which are spread upon and ploughed in with the surface-soil of the bog.' (*Report of Commissioners*, as above, p. 386.)

In the baronies of East and West Maryborough, comprehending, between them, considerably above 23,000 Irish plantation acres, or 37,000 English acres, only seventeen persons held farms of more than 100 Irish or 162 English acres: by far the greater number of holdings in the barony of West Maryborough were under 5 Irish or 6½ English acres. The principle of consolidating these small holdings has however been adopted by some of the landlords, and is gaining ground, but not very rapidly. In some other parts of the county (*e.g.* the barony of Portnehinch) the small holdings do not bear so great a proportion to the large ones. The smallest holdings are generally through the county occupied by tenants at will; but farms of 10 Irish (13 English) acres and upwards are usually held on leases which are granted for life or 21 years. The system of 'con-acres' (ground tilled and manured by the farmer, and let for the season to the labourers) is prevalent in the county, though not equally so in all parts of it.

The cottiers, especially those who hold under 'middlemen,' usually pay their rent in labour; but other small tenants usually pay in money, though a part is sometimes taken by the landlord in labour, such as carting, at busy times. The number of 'middle-men' (persons who take land of the proprietor and sub-let it) is diminishing: there are still however many of them, and to such an extent is the practice in some places carried, that frequently three or four 'middle-men' will intervene between the proprietor and the occupier of land. Rents are considered high, especially in the case of small farmers who hold under 'middlemen.'

The prevalent rotation of crops is, on the larger farms, as follows:—first year, potatoes with manure; second, wheat or barley, and third, oats; some persons then lay down the land to grass from two to five years. The small holders know little of rotation of crops; they raise potatoes and corn, either wheat, barley, or oats, alternately. The only artificial grasses cultivated by the small holders are clover and seeds. Some of the larger farmers grow clover, a few vetches, rye-grass, and trefoil: turnips and mangel-wurzel are grown, though not to a great extent, by some of the gentry and large farmers. The cultivation of potatoes has increased: peat or bog-stuff is commonly used as manure. The potatoes grown by the small farmers are 'lumpers,' a coarse but very productive variety.

The harvest is generally got in with care, except that the barley, and sometimes the other crops, are cut late, so as to occasion loss from shedding. It is commonly threshed as soon as cut, for the purpose of paying rent; and is usually sold by the sample: there are good corn-markets at Maryborough and Mount Mellick, at which last-named town much corn is ground into flour for the English and other markets.

Grazing-farms are not numerous, and are generally occupied by gentlemen farmers. The grazing-land is not commonly very good, and the quantity of it has rather decreased. There are no dairy-farms, but each of the large farmers keeps a few cows. The breed of cattle has been much improved, but the subject is not so well understood as in some of the neighbouring counties: the kinds most in request among the larger farmers are the short-horned or Durham, and the Ayrshire, but the small farmers think the native Irish breed is best, as being more accustomed to the food and climate of the country. The dairy cows most approved are either the native stock of a cross-breed between the native stock and the Durham or the Ayrshire. More cattle are fattened for exportation than formerly; the increase may be attributed to the introduction of steam-navigation as opening a means of communication with England, and to the improvements in rural economy. Little or no cheese is made at present, but a considerable quantity of butter. The increased intercourse with England has led to a great improvement in the making of the butter. The number of sheep kept is considerable, chiefly by the large farmers. This breed is generally large, and has been much improved within the last twenty years; it is a cross between the native Irish breed and the Leicester. The introduction of the Leicester sheep has led to improvement both in the quantity and quality of the fleece and the weight of the carcass. The horses are not kept in proper condition for working; nor is the breed of pigs so good as in some other counties of Leinster. Oxen are not much used for agricultural purposes.

The manures in general use are bog-stuff, animal manure, lime, marl or limestone gravel, and road scrapings. The small farmers have no knowledge of the advantage of stall-feeding over grazing considered as a source of manure. Lime is burned with culm, sometimes with turf; but is not used to the extent to which it might be used. Burning land is very little practised; the landlords generally consider it injurious.

The fences commonly consist of a bank with a ditch, and generally a hedge: but the hedge is usually irregular and insufficient, composed of whitethorn, briar, furze, or brambles, frequently with gaps of several yards in extent. Some of the gentry and large farmers have orchards, of which part of the fruit is sold. The farm-buildings and sheds are generally insufficient, and, among the smaller farmers, usually in bad repair. Modern improved agricultural implements are little used, except the light Scotch plough: threshing-mills, rollers, and winnowing-machines are found only in the yards of resident proprietors or large farmers.

A great number of persons have emigrated of late years, almost exclusively to the United States or to Canada. Many of them were Protestants, and possessed of some little property.

The labouring population very far exceeds the means of employment: of 3401 labourers in the three baronies of East and West Maryborough and Portnehinch, 1104 were constantly employed, 1857 occasionally employed, and 440, from illness, old age, or other causes, were seldom or never employed. Wages are very low; for constant labourers about 6*d.* a day with 'diet,' *i.e.* breakfast and dinner; 8*d.* or 10*d.* and in some cases 1*s.* a-day without diet: in hay-time and harvest the wages are occasionally as high as 1*s.* 6*d.* or even 2*s.* and 2*s.* 6*d.* In the colliery districts the colliers, according to the nature of their work, receive from 1*s.* 2*d.* to 2*s.* 2*d.* a-day. The 'diet' given by farmers to their labourers consists chiefly of potatoes and milk, sometimes 'stirabout,' or oatmeal porridge; some of the wealthier and more liberal occupiers add meat on Sundays and holidays. The labourers are not considered equal to the English in steadiness and skill; this inferiority may be partly ascribed to bad and insufficient food. Great distress prevails among the labourers from the beginning of June till harvest, so that the wretched peasantry are at times obliged to boil the charlock or wild mustard to eke out a miserable subsistence; and in years of scarcity or failure of the potato crop the distress extends upward to the small occupiers. The labourers live on the land of their employers, and usually have some land with their cabins: they pay their rent in labour: for a cabin alone they pay 1*l.* to 2*l.*; for a cabin which an acre of land (usually the worst on the whole farm) 3*l.* to 4*l.*: some proprietors allow their labourers more land (sometimes as much as six acres) for about the same rent that would have been charged to a farmer. The number of these 'cottiers,' or labourers who work regularly for a master under whom they rent their cabins, is in some parts of the county fast diminishing. The cabin is frequently built and almost always repaired by the labourer.

There is little employment for women or for children under the age for going out to service. What little work is done by women is chiefly by the labourers' grown-up daughters or other unmarried women, or by married women who have no family. Children above 14 or 16 sometimes get employment at 5*d.* a-day without diet, or 3*d.* a-day with it. There is rather more employment for women at some busy seasons, as harvest and potato setting and digging. Most labourers' wives keep fowls, by which they earn a trifle. The labourer usually keeps a pig.

Potatoes form the principal food of the labourers, and those chiefly of the coarsest sort called 'lumpers.' Meat, eggs, and fish are rarely enjoyed even by the small farmers, by the labourers never. The cabins of the peasantry are generally of clay and straw; some have a foundation of stones, and a few are entirely of stones; most of them consist of two apartments, a living room occupying two-thirds of the cabin, and a small chamber. There is never an upper story, and the roof is of sod covered with thatch; they are altogether miserable habitations, except the few belonging to the gentry and larger farmers, and occupied by their labourers. Many have no windows; others have only an unglazed opening, blocked up in cold or wet weather with straw or by a shutter, and some have glazed windows of all sizes. The general fuel is turf. The dress of the peasantry is generally wretched; the children, especially the boys, are half-naked, and go barefoot; the women and elder girls, through the cheapness of materials, are enabled to dress a little better; and the wives and daughters of the more comfortable labourers wear shoes and stockings. The furniture of the cabins and the supply of bedding is commonly wretched, and in the poorer cabins the inmates sometimes sleep on straw, hay, or rushes. In some parts of the county the cabins are altogether more comfortable and better furnished. Those round Mountmellick, inhabited by persons connected with the trading or manufacturing establishments of that town, are of superior character. Drinking is, or was lately, rather on the increase; the drunkards are chiefly of the class of small tradesmen.

Divisions, Towns, &c.—The county is divided into nine baronies, as follows:—

Name.	Situation.	Population in 1831.
Ballyadams	E.	9,344
Cullinagh	S.	15,447
Maryborough (East)	Central	15,941
Maryborough (West)	do.	10,723
Portnahinch	N.E.	18,362
Slievemargy	S.E.	15,803
Stradbally	E.	8,328
Tinnahinch	N.W.	17,116
Upper Ossory	W. & S.W.	37,167
		145,851

We have no authorities which give the areas of the respective baronies; but it may be stated that Upper Ossory is probably twice as large as any other; and that of the rest, Portnahinch, West Maryborough, Cullinagh, and Tinnahinch are the largest; Slievemargy has probably the most crowded population, a pre-eminence which may be ascribed to the mining district which is comprehended within it.

The assize town is Maryborough: there are one parliamentary borough, Portarlington; five market and post-towns, viz. Abbeyleix, Ballinakill, Mountmellick, Mountrath, and Stradbally; and five post-towns which have no market, viz. Ballybrittas, Ballyroan, Burros-in-Ossory, Clonaslee, and Rathdowney. Graigue is a suburb of Carlow. The largest villages are Arles, Ballylinan, Castletown, and Emo.

Maryborough is in a central situation, in the barony of East Maryborough. It was constituted the assize on the formation of Queen's County, by an act of 3rd and 4th of Philip and Mary, and received its name of Maryborough in honour of that queen. The town consists of several streets, narrow, irregularly laid out, badly paved, and altogether inconvenient; the principal street is on the road from Dublin to Limerick. The number of houses in 1831 was [illegible], of which [illegible] were inhabited by 641 families, 10 were uninhabited, and 13 building. Above 200 of these were comfortable houses, the rest were miserable cabins. The principal public buildings are the new county gaol and the lunatic asylum, the last being for the district which comprehends four counties, King's, Queen's, Westmeath, and Longford; a court-house and rooms adjacent for county business, formed out of part of the old gaol, an infirmary, a handsome range of infantry barracks, a parish church, a large and handsome Catholic chapel, three meeting-houses for Protestants, and a nunnery adjacent to the Catholic chapel. There are some remains of a strong castle which existed at the time when the town was fixed upon for the county town; the remains comprehend a bastion and part of the walls. Near the town are the ruins of the ancient church. The lunatic asylum stands in the midst of an enclosed area of above twenty-two acres, handsomely laid out and planted. The building has a front of hewn stone, 303 feet long, and will accommodate from 150 to 160 patients. It had 131 on the 1st of January, 1837. The county gaol is a spacious and well-arranged prison on the radiating plan; the management of it is well spoken of by the inspectors. (*Inspectors' Reports* for 1837.)

Maryborough was incorporated by charter of 12 Eliz. (A.D. 1570). The limits of the borough extend to the distance of 3000 feet from the walls of the castle (which is in the centre of the town), and comprehend an extensive rural district; a new and more contracted boundary has been therefore recommended. (*Reports from Commissioners of Boundaries of Municipal Corporations in Ireland.*) The burgesses were in 1833 reduced to three. The burgomaster is a justice of the peace within the district; but petty-sessions are held weekly by the county magistrates. There is no corporation police, but from 15 to 20 of the county constabulary are usually quartered in the town.

The town has little trade. The market, which is on Thursday, has improved; wheat, which was formerly scarcely brought to it, is now sold in considerable quantity. A branch of the cotton-manufacture, but on a small scale, is carried on. Shoemaking is prosperous. There are eight yearly fairs. The population of the town, in 1831, was 3223; that of the whole parish of Borris, in which the town stands, was 5300. There is neither benefit society nor savings' bank nor house of industry in the parish; but there are forty spirit-shops and one pawnbroker's shop.

The living is a rectory and vicarage, united with the rectory and vicarage of Kilcolmanbane and the vicarage of Straboe, all in the diocese of Leighlin, and comprehending altogether a population of about 8700, in 1831, of which about 1200 or 1300 belonged to the established church, while the rest were nearly all Catholics. There was a Roman Catholic chapel at Straboe, in the union, besides that of Maryborough. The net yearly value of the united benefice was returned at 533*l.* 6*s.* 9*d.* There were, according to the Parliamentary Returns for 1835, ten schools in Maryborough parish, and two in that of Kilcolmanbane; twelve in all in the union, with 811 scholars, viz. 445 boys and 366 girls: of these schools, two, both at Maryborough, with 259 boys and 221 girls, were national schools; two were classical schools for boys, with 32 scholars; two were girls' schools of the better sort, with 25 children (four of them little boys); three were connected with religious or charitable societies, with 84 boys and 53 girls; and three were hedge-schools, with 72 boys and 31 girls.

The quarter-sessions for the division, at which the civil business of the borough is transacted, are held here twice a year; the county assizes are also held here, and it is the place of election for the county. Maryborough returned two members to the Irish parliament, but was disfranchised at the Union. It gives the title of baron to W. Wellesley Pole, brother of Marquis Wellesley and the duke of Wellington.

Portarlington is on the river Barrow, which separates in this part King's County and Queen's County, in each of which part of the town is situated. It is about forty-four miles west-south-west from Dublin, through Naas and Monasterevan, and about twelve miles north-north-east from Maryborough. The part which is in King's County is in the parish of Cloneheene, in the barony of Upper Philipstown; that which is in Queen's County is in Lea parish, in the barony of Portnahinch. The town took its rise in the time of Charles II., who granted a large extent of country in this part of Ireland to Lord Arlington. The town consists of two principal streets, which meet in an area or square, the centre of which is occupied by one of the two churches or chapels. They are in some parts paved or flagged by private subscription, but are not lighted. Few towns in Ireland present so respectable an appearance, owing to its being the residence of an unusual number of private gentlemen. In 1831, there were in the town [illegible] houses, of which [illegible] were inhabited by 579 families, 10 uninhabited, and 3 building: a somewhat later return gives [illegible] houses, of which 300 are slated and the rest thatched; most of them built of lime and limestone. The population, in 1831, was 3091: a part of the inhabitants are descended from some French and German Protestant refugees settled here by Lord Arlington. There are two bridges and two churches (or more properly chapels), neither of them parochial; those of St. Michael and St. Paul, or, as they are sometimes called, the English and the French, from having been originally appropriated to the use respectively of the English and French settlers. Both the churches were erected by Ruvigny, earl of Galway, to whom the lordship originally held by Lord Arlington had come. The English church has a handsome spire. There is a handsome Roman Catholic chapel, with a spire 120 feet high, and a Methodist chapel. Over the market or town-house there are three rooms, the largest occasionally appropriated to assemblies. There are a small tobacco manufactory, a soap and candle manufactory, and a tan-yard; the rest of the trade of the town is retail. There is a corn and general market held on Wednesday, and a meat-market on Saturday: there are also eight yearly fairs for horned cattle, horses, sheep, and pigs. A branch of the Grand Canal passes near the town. The town was incorporated by charter, A.D. 1667. Courts leet and baron and a court of record are held under the lord of the manor, and petty-sessions are held by the county magistrates. From eight to ten of the county constabulary are generally stationed here. There are no public charities except schools, but there is a very excellent savings'-bank. Public-houses and spirit-shops are very numerous.

Portarlington returns one member to parliament. Before the Union it returned two members to the Irish parliament, but at the Union was reduced to one. By the Irish Reform and Boundary Acts, the franchise was extended, and the limits of the borough defined. The number of voters on the register, in 1834-5, was 156. The living of Lea (in which parish the part of the town which belongs to Queen's County is situated) is a vicarage, of the clear yearly value of 272*l.* (including the value of the glebe), and a glebe-house. There is a small parish church at Lea, and there are the two churches, founded by Lord Galway, in the town of Portarlington. These places of worship have (by the Parliamentary Returns, 1835) congregations amounting in the aggregate to more than 1000 persons. The Roman Catholic chapel had a congregation of 1300, and the Wesleyan of 100. In the whole of the two parishes of Geashill (of which Clonehorke is a dependency) and Lea, there were, according to the returns made to parliament in 1835, thirty-five day-schools, containing 1108 boys and 872 girls; and an adult school of 29 scholars: giving a total of thirty-six schools, and of 2009 persons under daily instruction. Five of the schools were in connection with the National Education board; four were partly supported by the London Ladies' Society, or London Hibernian Society; one was connected with the Kildare-place Society; and six were partly supported by private subscription. Of the private schools, one was for adults, three were classical schools for boys, two were girls' schools of a superior kind, three were ordinary day-schools, and eleven were hedge-schools. A loan-fund and a mendicity society have been established. There were also in Geashill parish eleven Sunday-schools for religious instruction, ten of them for Roman Catholics. Portarlington gives the title of earl to the Dawson family.

Abbeyleix is 9 miles south-south-east of Maryborough and 60 south-west from Dublin. The parish is chiefly in the barony of Cullinagh, but partly in that of West Maryborough, and partly in that of Fassadining, in the county of Kilkenny; the town is wholly in Cullinagh. Abbeyleix took its origin and name from a Cistercian Abbey in the territory of Leix, now Queen's County. The town is neatly built, the late Lord de Vesci having caused the old town to be entirely razed, and laid out the present one on a more eligible site. The number of houses in 1831, was 141, viz. 126 inhabited by 178 families, 10 building, and 5 uninhabited. There are a good market-house, a sessions-house, where the quarter-sessions for the division are held twice in the year, and a new bridewell. The population, in 1831, was 1009 for the town, and for the entire parish 5990. A considerable woollen manufacture is carried on: about two hundred persons are employed in combing, spinning, and weaving. There is a weekly market (on Saturday) and six yearly fairs. Freestone, limestone for burning, and potters' earth are procured in the neighbourhood. Abbey Leix, the seat of Lord de Vesci, surrounded by a demesne of more than 1100 acres, and thriving plantations, is near the town. The area of the parish is 11,974 acres. There are in the parish two parish churches, one rarely used: the other, a handsome modern building of Gothic architecture, with a tall spire, has a congregation of five hundred: there are a Roman Catholic chapel, with a congregation of two thousand, and a Wesleyan meeting-house, with a congregation of seventy. The living is a vicarage: the net value of the benefice (including a small glebe) is about 138*l.* There were, by the returns of 1835, six day-schools, with 203 boys and 151 girls; together 354 children: two of the schools are private schools, three are partly or wholly supported by subscription, and one is partly supported by the London Hibernian School Society and by local subscription. There are some almshouses, and a dispensary and infirmary.

Ballinakill is in Dysart Gallen or Galon parish, in the barony of Cullinagh, 13 miles south-south-east of Maryborough, and 64 south-west from Dublin. The town is in a bye-situation, and in a declining state; the streets are neither paved nor lighted. The number of houses, in 1831, was 360, viz. 335 inhabited by 346 families, 4 building, and 21 uninhabited: the population was 1927 for the town, or 4014 for the entire parish. The manufacture of woollens, though declined from what it formerly was, is still carried on, and there is a brewery. Formerly two markets were held weekly, but the Wednesday market has been long disused, and the Saturday market has been injured within the last few years by the establishment of that of Abbeyleix on the same day. Ballinakill was incorporated by James I., and returned two members to the Irish parliament, but the franchise was lost at the Union, and the corporation has since fallen into disuse. Quarter-sessions and petty-sessions were once held here, but have been removed to Abbeyleix. A body of the county constabulary are posted in the town. The parish of Dysart Gallen, or Dysert Galon, contains 10,557 acres. The parish church, a small modern building with tower and spire, is in Ballinakill; it has a congregation of from 150 to 250 persons. There are two Roman Catholic chapels, one in the town, and another in the rural part of the parish; they have congregations of nearly 4000. There were in the parish, by the Returns of 1835, nine schools with 429 boys and 407 girls; together 836 children. Of the nine schools, the two largest (containing 594 children) were connected with the National Board of Education; two were partly supported by subscription or other extraneous sources; the other five were hedge-schools.

Mountmellick is on the Owenass, one of the feeders of the Barrow, 7 miles north by west of Maryborough, and 31 miles west-south-west of Dublin. It stands chiefly in the parish of Rosenallis, in the barony of Tinnehinch, but a small part of it is in the parish of Coolbanager, in the barony of Portnehinch. The whole town had, in 1831, 7[illegible]0 houses; of which 687 were inhabited by 805 families, 15 were uninhabited, and 8 were building. There is one principal street; several of the houses are very neat and even elegant, and the town may be regarded as the most important and prosperous in the county. Cotton-weaving and coarse woollen-weaving are carried on to a considerable extent, and furnish employment to from 3000 to 4000 people in and round the town. There are an iron and brass foundry for the manufacture of machinery, a tan-yard, breweries, soap-houses, potteries, a distillery, and a corn-mill. A branch from the Grand Canal at Monasterevan to the town has tended greatly to increase its trade in corn, butter, and general merchandise. There are two weekly markets, and ten yearly fairs. A body of the county constabulary are stationed in the town: the quarter-sessions for the division are held here twice in the year. There is a chapel-of-ease in the town, in the parish of Rosenallis, which has a congregation of 350 persons; the two parish churches of Rosenallis and Coolbanagher (or rather, of Ardea, a parish united with Coolbanagher) are at a distance from the town. There were in the two parishes, in 1835, four Roman Catholic chapels, with aggregate congregations of 4000; four meeting-houses or other places of worship for Wesleyans, with congregations amounting to 350 persons, and one Quakers' meeting house with a congregation of 140: we know not which of these places are in the town. There were at the same time twenty-six day-schools; viz. seven in connection with the National Board; ten connected with the London Hibernian Society, the London Ladies' Hibernian Society, the Kildare-place Society, or supported by subscription, or by Erasmus Smith's fund; a Quakers' boarding-school, five private day-schools, and three hedge-schools: in these schools there were 1627 children, viz. 930 boys and 697 girls. There were also in Rosenallis two large Sunday-schools, kept by the vicar and the curate.

Mountrath is in the parish of Clonenagh, in the barony of West Maryborough, 8 miles west-south-west of Maryborough, and 60 west-south-west of Dublin, on the great road to Limerick. The foundation of the town was laid early in the seventeenth century, by Sir Charles Coote, who, in 16[illegible], obtained a grant of two fairs and two markets, and established a linen and fustian manufactory. The Rebellion of 1641 interrupted the rising prosperity of the town. In 1831 it contained 442 houses, of which 420 were inhabited by [illegible] families, 13 were uninhabited, and 9 were building. The population at the same time was 2593. There are a respectable market-house, and a court-house and bridewell lately erected. The church is a handsome building; and there are a large Roman Catholic chapel, a convent of the order of St. Patrick, and a Bridgetine nunnery. The Methodists and Quakers have also meeting-houses. Calico and stuffs are woven, and there are a large brewery, a malthouse, and an oil-mill. There is a considerable weekly market for corn and butter; there are six yearly fairs. The quarter sessions for the division are held here twice in the year; and there are petty-sessions held weekly. Ballyfinn House, the splendid seat of Sir C. H. Coote, is in a beautiful and well-wooded [illegible] near the town. There were in the whole parish in 1834 nineteen schools, viz. nine national schools, four schools partly supported by subscription, two convent schools, a boarded day and boarding school, two private day-schools, and a hedge-school. The two convent schools are attached to the Bridgetine nunnery in the town of Mountrath; one is for the education of children of the higher order, the other for the poor: the classical school is superintended by monks of the order of St. Patrick, who have a convent in the town. There is a large school-house in the town, erected chiefly through the liberality of Sir C. H. Coote; but by which of the above-mentioned schools it is occupied does not appear. The total number of children in the schools at the time of the return was 1789, viz. 1047 males and 742 females. There is a dispensary in the town.

Stradbally is in the parish and barony of Stradbally, 7 miles east of Maryborough, and 48 south-west of Dublin, on the road by Athy and [illegible] to Cork. Anciently there was a Franciscan monastery here. The town, which is on a small branch of the Barrow, in a pleasant situation, had, in 1831, 258 houses, viz. 241 inhabited by 331 families, 8 uninhabited, and 9 building. The principal street is spacious, the houses well built, and there is a bridge of three arches over the stream. The church is a handsome building. Near the town are Stradbally Hall and Brockley park, two mansions with their demesnes. The market is on Saturday, and there are five yearly fairs. There is a station of the county constabulary in the town. The quarter-sessions for the division are held four times in the year, in a neat court-house with a small bridewell attached; and there are petty sessions every fortnight. There are a dispensary, a savings' bank, and a Roman Catholic chapel. There were in 1834, in the parish, seven schools, viz. two boarding-schools, three day-schools, two of them on the system of the Kildare-place Society, a hedge-school, and a national school.

Ballybrittas is in Lea parish, in the barony of Portnehinch, 8 miles north-east from Maryborough, and 42 south-west of Dublin. It is a neat place, of pleasing appearance, comprising 57 houses, inhabited by 51 families, and 1 house building. Three fairs are held in the year. A body of constabulary are posted here, and there are petty-sessions once a fortnight. Ballyroan is in Ballyroan parish, in the barony of Cullenagh, 55 miles from Dublin on the road by Athy and Castle [illegible] to Cork. The place had, in 1831, 152 houses inhabited by 143 families, forming a population of 714. There is a station of the constabulary. There are three fairs. There are a neat plain church, a spacious Roman Catholic chapel, and a good school-house for an endowed classical and English school on Alderman Preston's foundation. There were also in 1834, in the parish, two day-schools, partly supported by subscription, and two hedge-schools. Burros in Ossory, in the parish of Aghaboe, in the barony of Upper Ossory, was anciently of considerable importance as a military post, being on the river Nore, and on a site encompassed by bogs. It now consists of one long street, on the road from Dublin to Limerick, 67 or 68 miles from Dublin, and 18 from Maryborough; and comprehends 139 houses, viz. 134 inhabited by 137 families, and 5 uninhabited. There are several fairs in the year. Quarter-sessions for the division are held here twice in the year, and petty-sessions at frequent intervals; there are a bridewell, a station of the county constabulary, and a dispensary. Clonaslee is in the barony of Tinnahinch, remote from any great thoroughfare, 8 miles west-north-west of Mountmellick, on the bank of the Gorragh or Clodagh, over which there is a good bridge. The village contained in 1831, 79 houses, viz. 75 inhabited by 83 families and 4 building: the population was 414. There is a parish or district church, also a Roman Catholic chapel. Petty-sessions are held weekly, and there are two fairs in the year. There is a school on Erasmus Smith's foundation, and one if not two national schools. Rathdowney is in the barony of Upper Ossory, 19 miles south-west from Maryborough, remote from any great thoroughfare, on a small stream that flows into the Erkin, a feeder of the Nore. The town contained in 1831, 251 houses, viz. 238 inhabited by 240 families, 11 uninhabited, and 2 building. The population was 1214. The houses are generally ill built and neglected, and the streets are ill paved. Petty-sessions are held in the town weekly, and there are several yearly fairs. There are a parish church, a Roman Catholic chapel, and a Wesleyan meeting-house in the town. There is a parochial school connected with the Kildare-place Society, and a national school in the town, and a second national school, and several other schools in different parts of the parish. There are in the parish the remains of three castles, of a church and burial-place, of a church and monastery, and of a very ancient tower.

Graigue is in the parish of Killeshin, in the barony of Slievemargue. It is close upon the border of the county, and forms a suburb of the town of Carlow, with which it is connected by a bridge over the Barrow. It contained in 1831 334 houses, of which 324 were inhabited by 357 families, 11 were uninhabited, and 6 were building: the population was 1772. There are two tan-yards, a flour-mill, and a distillery. The parish church is a handsome building; there is a very large Roman Catholic chapel. There are a national school and a station of the county constabulary.

Arles or Ailess is a neat village in the parish of Killeban and barony of Slievemargue, about 7 miles north-west of Carlow. It contains about 40 houses and 265 inhabitants. There is a small manufacture of linen and yarn carried on; the manufacture of tiles for roofing has been brought almost to nothing by the increased use of slates. Ballylinan is also in the parish of Killeban, but in the barony of Ballyadams. It has a police station, several fairs in the year, and petty-sessions weekly. It contained in 1831, 54 houses, viz. 49 inhabited by 101 families, 4 uninhabited, and 1 building: the population was 542. There are the ruins of an old church in the village. Castletown, in the barony of Upper Ossory, about 9 miles from Mountrath, takes its name from an old castle on the banks of the Nore. The village is also on that river. It contained, in 1831, 89 houses, many of them good residences, with a Roman Catholic chapel, and is altogether a place of neat and respectable appearance. Of the houses 82 were inhabited by 69 families, 4 were uninhabited, and 3 were building: the population was 375. There are large flour and oatmeal mills. There is a yearly fair, and petty-sessions are held every fortnight. A body of the county constabulary are posted here. Emo, in the barony of Portnehinch, 7 miles north-north-east of Maryborough, and 3 or 4 south of Portarlington, had, in 1831, only 24 houses inhabited by 17 families, and a population of 102; but it has a neat Roman Catholic chapel, a public school, and a constabulary station. Adjacent to it is Emo park, the seat of the earl of Portarlington.

Divisions for Ecclesiastical and Legal Purposes.—This county was formed of portions of the districts previously known as Leix and Ossory; the latter comprehending all that part of the county which is to the south and west of the Nore, the former including all the rest. The county was formed at the same time that the adjacent district of Ofaly was made shire-ground. The two were named respectively Queen's County and King's County, in honour of Mary and her husband Philip of Spain, and their capitals were named after the same royal personages, Maryborough and Philipstown.

The county is comprehended in the dioceses of Leighlin and Ossory (now united) and Kildare. The parishes in the six baronies of Ballyadams, Cullinagh, Maryborough (East and West), Stradbally, and Slievemargue, are in Leighlin, except one parish in Ballyadams barony, which is in the diocese of Dublin; those in the barony of Upper Ossory are in the diocese of Ossory, except one, which is in the diocese of Killaloe; those in the baronies of Portnehinch and Tinnahinch are in Kildare. All these dioceses are now in the ecclesiastical province of Dublin. Killaloe was in that of Cashel before the union of that province with the province of Dublin.

Queen's County is included in the home circuit: the assizes are held at Maryborough, and quarter-sessions for the divisions of the county are held at Maryborough, Mountmellick, Mountrath, Stradbally, Borris-in-Ossory, and Abbeyleix, twice in the year at each of these places. The number of persons committed for trial at the assizes and quarter-sessions in 1837 was 301; the number tried at petty sessions and before magistrates, 418; together, 719: being considerably below the average of the counties of Ireland in the number of assize and quarter-sessions cases, as well as in the whole number of criminals, but exceeding the average in the number of cases disposed of at petty-sessions, and before magistrates.

The county gaol is at Maryborough, and is well conducted, especially as it respects the male prisoners. There are three minor prisons, namely, at Abbeyleix, Borris-in-Ossory, and Stradbally, which are now remarkably well kept, clean, and regular. They are visited by the governor of the county gaol under the direction of the Board of Superintendence.

The county returns to parliament two members, who are elected at Maryborough. Portarlington returns one member. Before the Union the county sent altogether eight members to the Irish parliament, namely, two county members, and two each for the boroughs of Maryborough, Portarlington, and Ballinakill. At the Union, Maryborough and Ballinakill were quite disfranchised, and Portarlington lost one member. The number of county electors qualified in 1834-5 was 1692, of whom 1427 voted at the contested election of that time.

On January 1, 1836, the constabulary force of the county included one magistrate, 4 chief constables or sub-inspectors of the first class, and 6 of the second class, 49 constables, and 274 sub-constables, with 15 horses. On January 1, 1838, this force comprehended one sub-inspector, 4 chief constables of the first rate and 4 of the second rate; 1 head constable of the first class and 9 of the second class; 37 constables; 230 sub-constables of the first class and 46 of the second. The whole expenditure on this force for the year preceding January 1, 1838, was 14,327*l.* 14*s.* 3*d.* The total amount of the grand-jury presentments for that year was 19,566*l.* 16*s.*, namely: for new roads, repairs, bridges and roads, 4638*l.* 4*s.* 1*d.*; for building, repairs, and rent of session-houses, 427*l.* 2*s.*; for building new gaol, 923*l.* 1*s.* 6½*d.*; for gaol and bridewell expenses, 2270*l.* 6*s.* 3*d.*; for public and county officers' salaries, 2123*l.* 15*s.* 6*d.*; for the police establishment, 4467*l.* 16*s.* 6½*d.*; for the administration of justice, 480*l.* 1*s.* 8*d*; for deserted children and malicious injury to property, 388*l.* 13*s.* 7*d.*; for the infirmary and dispensaries, 1528*l.* 14*s.* 9*d.*; for building lunatic asylum, 462*l.* 5*s.* 6¼*d.*; for the support of the lunatic asylum, 587*l.* 9*s.* 2*d.*; for miscellaneous, printing, &c., 1269*l.* 5*s.* 4¾*d.* There are in the county a district lunatic asylum for Queen's County, King's County, Longford, and Westmeath; and an infirmary (both at Maryborough); a dispensary and fever hospital united; and eleven dispensaries.

The number of schools in the county connected with the National Board of Education in 1835 was 40, with 43 teachers and 5263 scholars.

History, Antiquities, &c.—Of the inhabitants of this county, in the earliest period of Irish history, nothing certain is known. At a somewhat later period the county was comprehended in the districts of Leix and Ossory. Ossory, which was originally a kingdom dependent on the greater kingdom of Leinster, was subjugated and annexed to Munster, still however preserving its separate organization as a kingdom. The chieftain or king of Ossory, one of the Macgillypatrick or Fitzpatrick race, stoutly resisted the Anglo-Norman invaders of Ireland in the twelfth century, and attacked Leix, which was then under Dermod, king of Leinster, who had called in the English. He subsequently however made his peace with the English, and managed to retain his independence. The adjacent district of Leix was included in the English pale, and was formed into a county palatine, which passed into the hands of the Mortimers, lords of Wigmore. In the reign of Edward II., O'More, an Irish chieftain, to whom Mortimer had entrusted the administration of his domain, became so powerful as to hold it in his own right, and to be a very troublesome opponent to the English in that part of the pale, and for two centuries the district was the seat of almost incessant war between the O'Mores and the English. It was either just previous to or during this unsettled period (in 1315, or rather 1316) that it was invaded by Edward Bruce and his confederates, who burned the castle of Ley near Portarlington, and a small burgh or town which had grown up under its protection. The district of Leix appears to have continued in a state of precarious independence till the reign of Henry VIII. Ossory also maintained at this time its independence, but its chiefs were usually in alliance with the English. In the reign of Henry VIII. this part of Ireland was again the scene of contest between the governors, Gerald, earl of Kildare (A.D. 1514), and afterwards Thomas Howard, earl of Surrey (A.D. 1521), and the sept or clan of O'More, but the struggle produced no decisive result. But on the death of Henry VIII., the O'Mores having again rebelled in conjunction with the O'Connors of Ofally (now King's County), were defeated by Sir Edward Bellingham, the lord deputy, who sent their chiefs prisoners to London (where O'More died), and re-annexed their territories to the English pale. A new rebellion in these two districts in the reign of Mary was quelled with a severity which threatened to extirpate the inhabitants, and the districts were, by act of parliament, converted into shires. In the latter part of the reign of Elizabeth, the O'Mores were again in rebellion, in consequence of which the county was invaded by the lord-deputy, the earl of Essex (A.D. 1599), who broke the power of the rebellious clan: their ruin was completed by Lord Mountjoy, the successor of Essex.

In the rebellion of 1641, Roger More, head of the now reduced sept of the O'Mores, acted a conspicuous part, and was in fact the mainspring of the rebellion. The insurgents attempted to seize several places in this county: Maryborough and the castle of Ballinakill fell into their hands, as well as Shane or Sion Castle near Coolbanagher, and other places of strength. They besieged the castle of Burros in-Ossory, but the garrison, consisting of Protestants of Upper Ossory, held out until relieved by Sir Charles Coote (A.D. 1642), who had been detached by the duke of Ormond, then posted with the government army at Maryborough. Shane Castle was retaken by the same officer. On the retreat of Ormond, the insurgents under Preston again overran the county, and Ballinakill, which had been taken from them or given up by them, was again besieged by their troops, but relieved by Colonel Monk: in 1643, it was a third time besieged, and, after a vain attempt to relieve it, was forced to surrender. Burros-in-Ossory Castle was also again besieged by the insurgents in 1642, but with what success does not appear: they took however the castle of Lea, or Ley, near Portarlington. In 1646, the insurgent force from Ulster, under Owen Roe O'Nial or O'Neal, occupied Maryborough and several other strongholds; but the Parliamentarians maintained a strong garrison in the castle of Burros-in-Ossory, by a party of which, in 1647, the neighbouring fort of Ballaghmore, held by the insurgents, was taken. The victors, on their way back, were attacked by a party of insurgents, and lost several men. In 1649, Maryborough and some other places were taken from the insurgents under Owen Roe O'Nial, by the Royalists under Ormond, with whom a considerable part of the more moderate insurgents had by this time united themselves. Shortly afterwards these places were taken from the Royalists by the Parliamentarians under Colonels Hewson and Reynolds. In the war which ensued on the Revolution of 1688, some fighting took place in the county, in which the Jacobites were defeated by William's army.

QUEENBOROUGH. [KENT.]

QUENTIN, ST., a town in France, capital of an arrondissement in the department of Aisne, situated on the right bank of the river Somme, very near the source of that river, 79 miles in a straight line north-north-east of Paris, or 86 miles by the road through Senlis, Compiègne, Noyon, and Ham; in 49° 51′ N. lat. and 3° 17′ E. long.

St. Quentin appears in the 'Itinerary' of Antoninus, and in the Peutinger Table, under the name of Augusta Veromanduorum, i.e. Augusta of the Veromandui, a nation of the great Belgic stock, inhabiting the country of Vermandois, to which they have given name. The oldest quarter of the town has retained down to modern times the name of Aouste. St. Quentin subsequently became the capital of the county of Vermandois in the government of Picardie. It was the seat of a bishopric, which in the sixth century was transferred to Noyon. In the sixteenth century it was a strongly fortified place, one of the bulwarks of France on the north-eastern frontier. In 1556 it was besieged by a Spanish army of 50,000 men, with an auxiliary corps of 8000 English, all under Emanuel Philibert, duke of Savoy. The small garrison under Coligny, admiral of France and governor of Picardie, made a brave defence, but was obliged to surrender after the complete defeat of a French army, which, under the constable Montmorency, had advanced to relieve the place. It was restored to France at the following peace of Cateau-Cambresis.

The streets of the town are for the most part of good width, lined with well-built houses; the principal streets end in a large square in the middle of the town, in the centre of which square is a deep and very curious well. The town-house, an antient Gothic building, forms one side of the square, and near it is the cathedral, another fine Gothic building, remarkable for its elevation and the boldness of [illegible] the steeple may be seen in clear weather [illegible] at Laon, a distance of twenty-four miles. The ancient fortifications have been converted into promenades and planted with trees. There are three faubourgs.

The population of the commune of St. Quentin in 1826, was [illegible]; in 1831, it was 17,686, of whom 17,089 were in the town; in 1836, it was 20,570. The manufactures are the most important of the department. Cotton-weaving and the spinning of cotton-yarn (in which steam is employed) give employment to at least [illegible] persons in the town and neighbourhood, one-fourth men, one-half women, and the rest children. The fabrics are of various kinds, muslins, calicoes, quiltings, muslins gauzes, &c. The bleaching and finishing of the goods give employment to 700 persons more; there are also bleaching-establishments for linen, of which a considerable quantity is manufactured in this part of France; though this branch of industry is by no means equal to what it was before the Revolution. The dyeing of cotton has been introduced of late years; the goods were previously sent to Rouen for that purpose. [illegible] and Cashmere shawls are woven in the town; and table-linen, and light fancy goods in silk, cotton, and wool are manufactured. In the manufactures of the district of which the town is the centre, it is computed that more than [illegible] workmen are employed in spinning or weaving; and [illegible] women and children in the auxiliary processes. (Dupin, *Forces Productives, &c. de la France*.) [illegible] soap, [illegible], leather, and machinery are made. There [illegible] flour-mills and oil-presses. The commerce of the town is promoted by the good roads by which it is connected with the neighbouring towns; and by the canal of St. Quentin, which, with other canals, connects the navigation of the Somme, the Aisne, and the Schelde. There are fourteen fairs in the year; one of them lasts nine days.

There are a tribunal de commerce, a chamber of manufactures, a subordinate court of justice, and several fiscal government offices. There are a high school, a society of sciences and arts, a public library of 12,000 volumes, a theatre, a free drawing-school; a course of instruction in mechanics and geometry as applied to the arts has been instituted in compliance with the dying exhortation of the late General Foy. The Benedictine D'Achery, and the Jesuit Charlevoix, known by his histories of New France (Canada), St. Domingo, Japan, and Paraguay, were born at St. Quentin.

The arrondissement of St. Quentin is divided into seven cantons or districts, each under a justice of the peace, and [illegible] communes: it had, in 1826, a population of 108,285; and in 1831, of 110,770.

QUERCITRON BARK, the bark of the *Quercus tinctoria* or *Quercus nigra* of North America, deprived of its brown epidermis. It was first introduced into England by Dr. Bancroft, and is now one of the most important dyeing materials. This bark contains a yellow colouring matter mixed with much tannin; the colouring principle amounts to about eight per cent., and may be extracted by water; and, according to Chevreul, this colouring matter may be obtained by gently concentrating the infusion of the bark. It is then deposited as a crystalline matter, which has a [illegible] appearance as long as it remains suspended in the liquor in which it is formed. Chevreul gives it the name *quercitrin*, but, according to Berzelius, it is not a pure immediate principle. It is stated by the former chemist that quercitrin is slightly acid, as is shown by its restoring the yellow colour of turmeric reddened by lime. It is slightly soluble in ether and more soluble in alcohol. Water dissolves it. The solution is rendered orange-yellow by alkalis; the acetates of lead and copper, and chloride of tin precipitate it in yellow flakes; sulphate of iron renders it olive-[illegible], and then precipitates it. Sulphuric acid dissolves quercitrin, and the solution, which is of a greenish-orange colour, is rendered turbid by water. When submitted to dry distillation, quercitron yields, among other products, a liquid which readily affords yellow crystals of quercitrin unaltered in properties.

The tannin which quercitron contains is of that variety which gives a green colour with persalts of iron. Its presence greatly deteriorates the beauty of the yellow colour, because it is precipitated by the same reagents as the colour itself, and gives it a brownish tint. In dye-works therefore the tannin is precipitated by adding a solution of glue to the decoction, in order to precipitate the tannin, and there is [illegible] a more delicate and brilliant yellow, which is afterwards precipitated in combination with alumina or oxide of tin. With the salts of iron quercitron gives a great variety of olive and drab tints, dependent upon the presence of more or less tannin, and the strength of the decoction employed.

QUERCUS, the Latin word for an 'oak tree,' which is of frequent occurrence in the Roman writers. It is now, as then, applied to the oak, and all the allied species associated with it by botanists in one common genus. Quercus differs essentially from Castanea, the chesnut, in having short obtuse stigmata, and from both it and Fagus, the beech, in the cells of its ovary containing two ovules instead of four. It is also distinguished by its acorn or nut being seated in a cup, and not in a close husk; but there are intermediate conditions of this part, technically called the cupule, which render it of less value as a mark of distinction than would at first sight appear. Many of the oaks of the hotter parts of Asia have the acorn completely enclosed within the cupule. Still however the prickly husk of the beech and the chesnut, splitting into valves, may in general be distinguished from the closed-up cup of the Indian oaks.

Oaks, like roses, are scarcely known in a wild state in the southern hemisphere; in the islands of the Indian Archipelago they reach their most southern limits, especially in Java; thence they pass upwards beyond the equinoctial line, and following the eastern parts of Asia, they spread to the westward along the Himalaya Mountains, and reaching Europe, are only arrested by the Atlantic Ocean. On the other hand they find their way to the eastward of their Asiatic origin, and overrun America from Canada and New Albion through California and Mexico, till their progress to the south is stopped by the Isthmus of Darien.

While however the genus is thus extensively distributed, the species are confined within comparatively narrow territorial limits. Many of the Javanese kinds appear to be peculiar to the Indian Archipelago, or only occur near the south-eastern angle of Asia. Those of the Himalaya are perfectly distinct from the oaks of the Trans-Himalayan regions, and have not even been found on the mountains of Persia. Several of the Oriental kinds are known nowhere else, and the American species are quite peculiar to that country.

On this account the species of oak are extremely numerous; probably not fewer than one hundred and fifty; and as always occurs in large genera, they are difficult of distinction by unskilful persons. Nevertheless the universal utility of their timber, and their striking beauty as ornaments of scenery, have caused them to be written upon by persons of little botanical knowledge, and the consequence has been such a confusion and entanglement of the history of even common and well known species, as can only be remedied by a long and patient examination of the genus by a botanist of great practical skill. On the present occasion we can pretend to nothing more than a brief account of those species which are best known, or to which it is most essential that attention should be directed. The reader will find a very elaborate account of the genus in Loudon's *Arboretum Britannicum*, vol. iv., where are good cuts of numerous species and an abundance of popular and amusing information.

Although a geographical arrangement of species is not a very scientific mode of treating the subject, we believe it to be the best that we can follow on the present occasion.

I. Oaks of Europe, Northern Asia, and Barbary.

Under this head we include all the more common species of the genus, the greater part of which exist in cultivation in this country. They may be divided into three groups: the *forest oaks*, or *Robora*; the *Evergreen oaks*, or *Ilices*; and the *Mossy-cupped oaks*, or *Cerres*.

a. The Forest Oaks (Robora).

The species comprehended under this head have deciduous thin leaves, whose lobes are never lengthened into a bristle, and whose acorns are seated in shallow cups, the scales of which are so short and closely pressed to the sides as not to form visible excrescences. The wild oaks of England may be taken as the representatives of the others, which differ from them chiefly in the quantity of down upon their leaves, the size of the acorns, and the quality of their timber.

Q. Pedunculata, Common British Oak. Leaves smooth or nearly so, with numerous deep sinuosities and a thin texture, with but little polish on the upper side. Acorns arranged in long stalked spikes. This, which is our commonest oak in England at the present day, appears not to be confined to the colder parts of Europe, as has by some been supposed, for we have specimens before us both from Spain and Hungary, but it is certainly much more common in the north than in the south, where its place is usurped by the next species. It has the reputation of being the *true British oak*, whose timber is alone suited for naval purposes on account of its durability and hardness; but this is a mere fable, the wood of the next species being as suitable in all respects under equal circumstances. But the timber of the oak, like all other wood, is materially affected by the nature of the soil in which it grows, and this has probably given rise to the often repeated assertion that Sussex oak, which chiefly consists of Q. *pedunculata*, is the best kind that can be employed in shipbuilding. The species is readily known by its leaves having very short stalks, or none at all, while the acorns are placed on very long stalks. In consequence of the importauce of distinguishing it from Q. *sessiliflora*, we have thought it desirable to introduce a wood-cut of the plant, common as it is.

1, Q. pedunculata; 2, Q mannifera; 3, Q. sessiliflora.

The Q. *fastigiata* of the gardens is a singular variety, with the branches rising close to the stem, like those of a Lombardy poplar.

Q. *sessiliflora*, Sessile-cupped oak. Leaves on long yellowish stalks, with numerous sinuosities, and a firm texture; much polished on the upper side. Acorns either altogether sessile or arranged in very short stalked spikes. We have already stated that the timber of this has been supposed, although erroneously, to be inferior to that of Q. *pedunculata*. Experiments as to strength and toughness have shown that there is no material difference between the two in those respects, and the durability of the wood of the sessile-cupped oak is attested by the well known fact, that the roof of Westminster Hall is constructed of it, and not of chesnut, as has been sometimes said. It has been found to be the timber of some of the most antient buildings in this country and elsewhere; an immense beam in an old Shropshire building, now called Stone House, was Q. *sessiliflora*, and the oak usually obtained from bogs, where it must have lain for centuries, has often proved to be the same.

The wood may be easily known by its medullary rays, or silver grain, being so far apart that it cannot be rent, and this gives it quite a peculiar aspect. Q. *sessiliflora* is found all over England now, but nowhere in much quantity. It however is more abundant in the west than elsewhere, and constitutes the greater part of the oak of North Wales. It is a much handsomer plant than the last, and grows considerably faster, and therefore is by far the most advantageous kind for the planter. Its comparative scarcity at the present day may perhaps have arisen from its having been felled in preference as long as any of it remained in the antient forests, which its superiority in size to the other species would render probable, and not having been replaced, it would thus become gradually exterminated. It appears to be still common over all the south of Europe, where however it is not uncommonly mistaken for the last. The supposed species called Q. *apennina* and Q. *microcarpa* are probably varieties of it. What is called the Durmast oak, which has been regarded as a species by some botanists, under the name of Q. *atrovirens*, or *intermedia*, seems to us a slight variety of Q. *sessiliflora*, with the leaves pubescent on the under side. It is here in all probability that the classical Esculus of Virgil belongs, for, according to Professor Tenore, a broad-leaved variety, which he calls Q. *robur Virgiliana*, answers in all respects to the language of the poet, and its acorns are sweet, and eaten like chesnuts at this day in Italy, where they are called *Quercia castagnara*. (*Osserv. sull. Flor. Virgiliana*, p. 12.)

Q. *pubescens*, a native of the southern parts of Europe, has most of the characters of Q. sessiflora, but its leaves are smaller, often quite woolly on the under side, and the lobes are themselves much sinuated. It has been injudiciously confounded with that species, to which it is said to be in all respects inferior in the quality of its timber. It forms a majestic tree, with much the habit of Q. Cerris.

The Q. *Esculus* of Loudon is, no doubt, the same as the last; but what the plant was to which Linnæus applied the name, and which has been supposed by some to be the Esculus of Virgil, is altogether doubtful. Another oak related to the sessile-cupped is the Q. *pyrenaica*, or *Tauzin*, a small scrubby tree inhabiting poor sandy soil in the south of France, and throwing up an abundance of suckers. Its wood is of little value except for the staves of casks. The species is readily known by its grey leaves, the hair of which is remarkably coarse.

b. The Evergreen Oaks (Ilices).

All the European oaks with leaves truly evergreen belong to this section, which however in some respects approaches the mossy-cupped oaks when the latter acquire a semi-European habit. In such cases they are known by the scales of their cups being very short, and the toothings of the leaves not bristle-pointed.

Q. *Ilex*, Common Evergreen Oak, or Holm Oak. Leaves ovate-oblong, acute, coriaceous, entire, or serrated, hoary beneath. Bark even. Acorns ovate, on short stalks. A most variable plant, common all over the south of Europe, where it may be found with leaves varying from being as prickly as a holly to being as even at the edge as an olive, and from the size of a sloe-leaf to that of a beech. It loves the neighbourhood of the sea, and in its wild state generally grows singly or in small clusters, not forming forests. Its wood is very hard and heavy, tough, and in all respects excellent quality, where its weight is not against it. The acorns are bitter and unfit for food.

Q. *Ballota*, Sweet-acorn Oak. Leaves elliptical, coriaceous, entire or serrated, very obtuse, white, and downy beneath. Bark even. Acorns cylindrical, elongated. This evergreen oak, says Captain Cooke, is one of the leading vegetable features of nearly all Spain. The native woods are formed of it in a great measure. As a species it is quite distinct from the Q. Ilex; the leaves are thicker, more rounded at the point, of a dull glaucous green, and the tree is altogether more compact and of a less graceful form. The great and essential difference however is in the acorns, which are eatable, and when in perfection are as good as or superior to a chesnut. To give this sweetness they must be kept, as at first they have a considerable taste of tannin, which however disappears in a few days. These are the edible acorns of the antients, which they believe [illegible] the Gypsy [illegible] on the passage from the ocean to the Mediterranean; a fable only proving that the species grows on the delicious shores and rocks of Andalusia, which unhappily is no longer the case. (Compare Cooke's *Sketches in Spain*, vol. ii. p. 244.) This author says that the name Bellota is from the Spanish *bellotas*, which means acorns generally. But the Persians have an acorn which they describe under the name of *Shah-bullout* and *Bellout-mal-malik*, and the acorns of Q. [illegible] are sold in Indian bazaars as *Bellout*, as we learn from Dr Royle; therefore the name has probably an Eastern origin. This species is the Q. *gramuntia* of Linnaeus, and is cultivated in England, but does not bear acorns. We have it also from Algiers. Captain Cooke calls it Q. *Hispanica*.

Q. *rotundifolia*, Round-leaved Oak. Leaves nearly orbicular, with spinous teeth, a little heart-shaped at the base, [illegible] above, downy beneath. Very little is known of this plant, except that it is allied to Q. Ilex. Smith and others say it is a Spanish plant, and if so, they probably meant Q. Ballota; but we have before us a Turkish specimen, of which a cut is given, to which the name is very applicable, and which is quite different from that species.

1. Q. Suber. 2. Q. rotundifolia.

Q. Suber, Cork-tree. Leaves ovate-oblong, bluntish, coriaceous, entire or sharply serrated, downy beneath. Bark cracked, fungous. The Cork-tree is spread through all the warm parts of Spain, but is most abundant in Catalonia and Valencia, whence the principal exports have been made. In the property of forming a spongy soft substance on its bark, it surpasses all other European trees, and hence is of the greatest value for corks and for similar purposes. The form of the tree is said to be much more beautiful than that of the common evergreen oak, and in the districts suited to it attains a great height. The species bears the climate of London, but acquires little of its natural beauty in this country.

Q. *fagineus*, Beech Oak. Leaves on short stalks, obovate, with numerous uniform shallow lobes; downy beneath; when young somewhat heart-shaped and unequal at the base. Fruit sessile. Cup with downy, close-pressed, somewhat [illegible] scales. Acorn conical or somewhat cylindrical. A native of Portugal, Spain, and Tangiers, and apparently unknown in our gardens. Mr. Barker Webb, however, who has studied some of the European species with great care, regards it as identical with Q. Tauzin, or Q. australis, and if so, we possess it. The same learned botanist reduces to this the Aleppo gall-nut oak, Q. infectoria, and he is probably right.

1. Q. [illegible] 2. Q. [illegible]

Q. *coccifera*, Kermes Oak. Leaves elliptic-oblong, rigid, smooth on both sides, with spreading, bristly, spinous teeth. Acorns ovate. Cup with spreading pointed scales. A native of the south-eastern parts of Europe, where it forms a small bush, resembling a dwarf holly. It is celebrated as being the haunt of the Kermes insect, which yields so brilliant and permanent a blood-red dye that the old Flemish tapestries, dyed with it two centuries ago, have lost none of their brilliancy. For the manner of collecting the Kermes, and for many particulars concerning it, see Loudon's *Arboretum Britannicum*, p. 1899.

c. The Mossy-cupped Oaks (Cerris).

The species of this section are remarkable for their thin deeply pinnatifid leaves, the long narrow loose scales of their cup, and their equally long deciduous stipules. In this as in other parts of the genus, there is much confusion and uncertainty regarding both the limits of species and the quality of their timber.

Q. *Cerris*, Turkey Oak. Leaves deciduous, on very short stalks, oblong, deeply and unequally pinnatifid; hairy beneath; lobes lanceolate, acute, somewhat angular. Stipules longer than the footstalks. Cup hemispherical, with long loose hairy scales. An exceedingly common plant all over the south-east of Europe, where it seems to form some of the finest specimens of oak. It has an open, straight, graceful mode of growth, very different from the gnarled and tortuous appearance of native British oaks, than which it also grows much faster. It would seem to be unknown in Spain, where its place appears to be taken by the Q. [illegible] of Lamarck. The gardens contain numerous varieties, the most striking of which are the half-evergreen Lucombe oaks, said to have been produced between the cork-tree and the Turkey oak, about the year 1762, by Mr. Lucombe, nurseryman, Exeter. This is however a statement that is open to some doubt: see Q. *Hispanica*. The timber of the Turkey oak is beautifully mottled, in consequence of the abundance of its silver grain; and there is reason to believe that it is, under favourable circumstances, equal to that of any other species. At least the Sardinian oak, so much valued and employed for ship-building, has the appearance of being produced by it. It is also reported to be much used for such purposes in Turkey and France. It is however probable that the Adriatic oak, which has turned out so ill in our dockyards, is the produce of the same species in an unfavourable climate. But this is however a matter of probability only, and requires confirmation. It is however certain, that the wood is very handsome, and well suited for indoor ornamental work; this has been found to be the case with the wood grown in England. (*Hort. Transactions*, 2nd series, vol. i., p. 338.)

Q. hispanica, the Spanish Oak. Trunk corky. Branches rather erect. Leaves nearly evergreen, lanceolate, acute, with fine serratures or crenatures, which are sharp-pointed, coriaceous, deep green, glaucous, and downy on the under side. Cups top-shaped, somewhat sessile, with shaggy, prickly, spreading scales. According to Mr. Barker Webb, this plant grows in Spain and by the Algerine river Monchique, and he reduces to it as synonyms the Q. crenata of Lamarck, Pseudosuber of Desfontaines, Ægilopifolia of Persoon, and the Lucombe oak of the English nurseries. He states that its leaves, stiffer fastigiate habit, turbinate cup, much shorter scales, and corky bark, clearly distinguish it from Q. Cerris: as to whether it is evergreen or deciduous, that depends upon the degree of cold to which it is subjected in winter; and he declares that upon comparing the authentic specimens of Desfontaines, Q. pseudosuber, with others cut from the original Lucombe oak, he finds them identical. The latter plant however is stated to have been raised at Exeter from seed between Q. Suber and Q. Cerris, an origin that was impossible in Spain; where however common Q. Suber may be, Cerris is not found in a wild state. We cannot pretend to reconcile these contradictory statements.

Q. austriaca, the Austrian Oak. Leaves on longish stalks, ovate-oblong, slightly but copiously sinuated, downy and hoary beneath; lobes short, ovate, acute, entire. Stipules shorter than the footstalks. Cup hemispherical, bristly. Of this plant, which is found in Austria, Hungary, &c., the leaves are larger and more deeply sinuated than in Q. hispanica, and the acorns are considerably larger; otherwise it is very like that species. It also approaches nearly to Q. Cerris, from which the shallow lobes of the leaves, and the stiffer and more bristly scales of its cups, seem to separate it. Hither is no doubt to be referred the Fulham oak of the English nurseries. That it is distinct from Q. Cerris there is no doubt, but it may be the same species as Q. hispanica.

Q. Ægilops, Great prickly-cupped Oak, or Valonia. Leaves ovate-oblong, with bristle-pointed tooth-like lobes, hoary beneath. Cup very large, hemispherical, with lanceolate, elongated, spreading scales. The Morea and adjacent countries produce this valuable tree, which yields the acorns called velani, or valonia, in commerce, of which nearly 150,000 cwt. are imported yearly for the use of tanners, and sold from 12*l.* to 15*l.* a ton. The tree is reported to be handsome in its own country; but with us, although it has long been cultivated, it is an inelegant tree, of a stunted mode of growth. What has been said of its elegant appearance and so forth, seems to belong to Q. Cerris.

II. *Oaks of the Levant.*

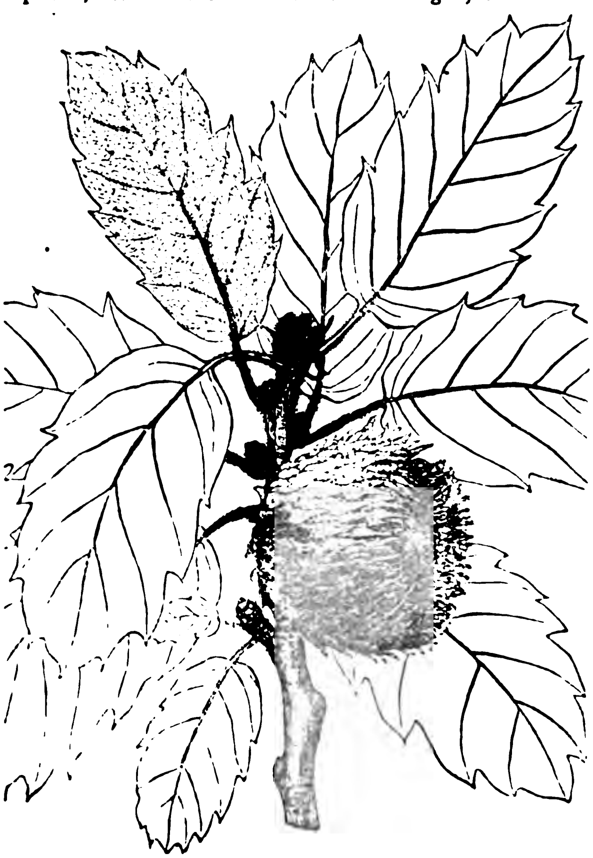
Little has hitherto been ascertained regarding the species of this part of the world. The French traveller Olivier brought home with him a plant very near Q. Cerris, the mossy-cupped oak, which he reported to be met with throughout great part of Asia Minor, and to furnish the wood employed in the arsenal of Constantinople. His specimens were examined by Lamarck, who called them Q. crinita, but little more is known about the species. Another plant, under the name of Q. rigida, has been published from Caramania, where the oaks are said to arrive at a great size and beauty; and the common gall-oak, Q. infectoria, has long been known. But there can be no doubt that the mountainous regions intervening between the Turkish empire and India produce oaks that require investigation, and three perfectly distinct species have in fact been lately sent from Koordistan. Of all that have yet been found in the countries of the East, we shall give a short account.

Q. crinita, Hairy-cupped Oak. Leaves on long stalks, oblong, deeply pinnatifid, downy beneath, lobes lanceolate, bluntish, nearly entire. Cup hemispherical, downy, bristly. A tree of Asia Minor, found by Olivier, and figured in his 'Travels,' t. 12, and said to be the same as an Armenian species met with by Tournefort, and after him called Q. Tourneforti; but this is doubtful. It is described as a large tree yielding excellent timber, employed extensively by the Turks in naval constructions. There is however very little in the accounts hitherto given of the plant to distinguish it from the common Turkey oak, Q. Cerris, with which Mr. Loudon combines it, but not upon satisfactory evidence.

Q. infectoria, Oriental Gall-oak. Leaves ovate-oblong, very smooth on both sides, deeply toothed, somewhat sinuated, deciduous. Fruit sessile. Cup tessellated. Acorn elongated, nearly cylindrical. A very common plant in Asia Minor, where its branches are attacked by an insect, the Cynips scriptorum, which punctures them, and causes the formation of the oak-galls so well known in commerce. It forms a scrubby bush rather than tree, and is of no value except for its galls. Its branches occasionally produce large brownish red tubercles, spongy within, which are by some supposed to be the apples of the Dead Sea, whose appearance was tempting, but which contained only dust and ashes.

Q. rigida, Stiff-leaved Oak. Leaves oblong, undivided, with spinous serratures, smooth, glaucous beneath, heart-shaped at the base. Footstalks bearded at the summit. Scales of the cup rigid, spreading. A native of Caramania, of Koordistan, and, according to Sibthorpe, of the Morea; but the last is doubtful. It is a handsome-looking plant, so far as can be judged from dried specimens, but nothing is known of its uses.

Q. Brantii, Mr. Brant's Oak. Branches, footstalks, and leaves underneath covered all over with thick short wool. Leaves heart-shaped, ovate, acute, with bristle-pointed teeth, ash-coloured, with starry down on the upper side. This is described in the 'Botanical Register' as being a most remarkable plant; the full-grown leaves being six inches long, including the footstalk, and three inches and a half across at the widest part, which is near the base. They are as downy as those of a young plane-tree. The species appears allied to Q. Ballota, a Spanish species.



Q. Ægilops.

1, Q. Libani; 2, Q. Ballota; 3, Q. Iberica.

Q. castaneaefolia, the Chestnut-leaved Oak. Leaves oblong-lanceolate, rather downy on the under side, coarsely serrated, with bristle-pointed lobes. Acorns nearly sessile, oblong, with the cups, when old, covered by reversed scales. A tree from the province of Mazanderan, reported to be very beautiful. The leaves are often from four to five inches long. Mr. Barker Webb states that it is the same as what has been called Q. Libani, and that it is remarkable for having large depressed fruit, with wide lozenge-shaped scales turned back at the point.

Q. regia, the Royal Oak. Leaves stalked, ovate-lanceolate, heart-shaped, wavy, with coarse sharp unequal serratures on each side green, shining, and smooth. The lobes of the leaves terminated by a conspicuous bristle. From Kurdistan. It is a noble species, with leaves as large as those of a Spanish chestnut, and very like them.

Q. mannifera, the Manna Oak. Leaves stalked, oblong, somewhat heart-shaped, cut; the lobes blunt, smooth above, downy beneath. Young acorns oval, stalkless, smooth. An inhabitant of the Koord Mountains, where it has lately been discovered by Mr. Brant, the British consul at Erzeroum, who found that the Koords obtain a sweet mucilaginous substance from its branches and leaves by steeping them in boiling water at the hottest season of the year, and afterwards evaporating the water. This substance is made into cakes and sold in the markets of the town of Van under the name of Ghiazanjabeen, 'the sweetmeat of heaven.' The species is very near Q. sessiliflora, especially a form of it which has been named Q. mannifolia. See the *Botanical Register* for 1840, p. 33 of the miscellaneous matter.

Q. Iberica, the Georgian Oak. Leaves oval-oblong, downy beneath, sinuated, with short blunt somewhat mucronate lobes. Acorns nearly sessile. Cups hairy, with sharp-pointed scales. A native of Georgia. Bieberstein describes it as a tree with the appearance of Q. sessiliflora, of which he thinks it may be a downy variety. He distinguishes it from Q. pubescens by that species being smaller and more downy, and its young leaves and branches covered with woolliness.

III. *Oaks of the Himalayas, China, &c.*

Although a great deal of information has been collected by Indian botanists concerning the oaks of the cold provinces of India, China, and Japan, so far as the distinction of species is concerned, yet, as none of them have been yet introduced into general cultivation in Europe, although occasional specimens occur in the gardens of collectors of rare plants, and as we know little of the uses to which they are respectively applied, it will not be necessary to dwell upon them at much length. All travellers in the Himalayas testify to the abundance of oaks. The people employed by Dr. Wallich gathered a considerable number of species, and Dr. Royle assures us that they are found from moderate elevations up to the limits of trees. Among these, all from the lower regions are, no doubt, too tender for cultivation in Great Britain; but of the Alpine species some may be expected to prove hardy. We shall only notice the following:—

Q. semecarpifolia, Marking-nut leaved Oak. Leaves obovate, obtuse, coriaceous, entire; heart-shaped at the base; downy beneath; the young ones with spinous teeth. Acorns solitary or in pairs, on short downy stalks, depressed at the point, about twice as long as the shallow scaly cups. As this species occurs in the Himalayas at the upper limits of the forests, at even greater elevations than the Pines, it would, no doubt, suit the climate of England; and, if so, its introduction would be very desirable, for it is stated to form a magnificent tree, whose timber is much esteemed by the natives. Dr. Wallich reports it to measure frequently 80 to 100 feet in height, with a girth of the trunk, at six feet above the ground, of fourteen to eighteen feet, and he says he has frequently met with individuals of far greater dimensions. See Wallich's *Plantae Asiaticae Rariores*, i. 114.

Q. incana, the Himalayan Ilex. Leaves coriaceous, ovate-lanceolate, shining and smooth on the upper side, densely downy beneath, with coarse serratures which are not bristle-pointed. Acorns solitary, sessile, ovate, but little protruded beyond the hemispherical downy cup, the scales of which are small and closely pressed. A beautiful tree, very like the evergreen oak of Europe. Its leaves are much more woolly on the under side. Dr. Wallich found it in Kumaon, where the people called it *Moroo*; Dr. Royle states it to be the *Ban* of the hill people, who use it, and that it occurs at moderate elevations. It is therefore in all probability tender.

Q. lanata, Woolly-leaved Nepaul Oak. Leaves elliptic-oblong, deep green, sharply serrated, coriaceous; densely woolly beneath. Fruit in very short axillary solitary spikes. Cup scaly, without prickles. This is one of the handsomest oaks yet discovered, and it exists in a living state in the gardens of this country, but, as might be expected from its native localities, it is not hardy enough to bear the climate of London without protection. In the Himalaya Mountains, where it is found wild, it is one of the first species that appears as the mountains are ascended, and it is there associated, according to Dr. Royle, with the Tree Rhododendron. In his 'Arboretum Britannicum,' Mr. Loudon supposes this to be the same as Roxburgh's Q. lanata, quite a different plant, not yet known in England in a living state.

Q. annulata, Ring-cupped Oak. Leaves obovate, taper-pointed, serrated in their upper half; somewhat glaucous and silky beneath. Acorns axillary, sessile, ovate, with the cup furrowed concentrically. Plants of this occur in our gardens; but they are too tender for the climate of London. In the Himalayas the species is said to form a very large tree, with excellent timber. The leaves are something like those of a sweet bay-tree, but more glaucous on the under side, and with a longer point. The Paharies are said to call it *Phullaut*, whence Q. Phullata, one of its names. It may be as well to remark that the fig. 1904, of Loudon's 'Arboretum Britannicum,' p. 1922, given for this species, has no resemblance to it.

Q. chinensis, the Chinese Oak. Leaves ovate-lanceolate, taper-pointed, with bristly shallow serratures, and very long footstalks; slightly downy on the under side. Acorns globose, sessile, in pairs. Cups with hoary lanceolate scales, the exterior of which are reflexed, and longer than the acorn. A beautiful Chinese species, found by the botanists attached to the Russian mission to Pekin in mountainous places. It is said to have exactly the habit and appearance of a Spanish chestnut. We give a figure of it from specimens communicated by Dr. Bunge its discoverer.

1, Q. chinensis; 2, Q. castaneæfolia.

IV. *Oaks of the United States of North America.*

In general these are cultivated in England, where they are found tolerably hardy. They however evidently suffer from want of summer heat, and are by no means of the same value to us as the species of the continent of Europe; and it may be doubted whether any of them are ever, in their own country, such noble trees as the finest specimens of Q. pedunculata and sessiliflora. We shall only mention the kinds common in the plantations of Great Britain.

Q. alba, White Oak. Leaves oblong, deeply pinnatifid, glaucous beneath, lobes linear-oblong, obtuse, entire, dilated upwards. Fruit stalked. Cup depressed, warty. A very fine species, producing sweet acorns and excellent timber, and approaching nearer to the European forms than any other American species. Specimens of it in the American forests are often 70 or 80 feet high.

Q. Prinus, Chesnut-leaved White Oak. Leaves on longish stalks, obovate, acute, somewhat downy beneath, with nearly equal dilated, callous-tipped, tooth-like serratures. Cup contracted at the base. Acorn ovate. A tree of considerable beauty, varying considerably according to soil and situation, and hence divided by some writers into many species, called Q. palustris, montana, monticola, acuminata, Castanea, pumila, Chinquapin, prinoides, tomentosa, discolor, &c., under all which names it is propagated in the nurseries. The wood is porous, and not of very good quality, but the broad bright green foliage is handsome.

Q. coccinea, Scarlet Oak. Leaves smooth, oblong, deeply and widely sinuated, on long stalks, lobes divaricated, acute, sharply toothed, bristle-pointed. Cup turbinate, half as long as the acorn. The middle States of North America abound in this and the following species, which derive their name from their leaves becoming in the autumn of a rich crimson colour. It forms a large and graceful tree, but the head wants massiveness. The wood is of very little value, and perishable; it is only employed for fuel and for staves for casks intended to hold dry goods. It grows fast, and stands the climate of even the colder counties of England.

Q. rubra, Mountain Red Oak. Leaves smooth, oblong, sinuated, on long stalks, lobes acute, sharply toothed, bristle-pointed. Cup flat underneath. Acorn ovate. A specimen of this is said by Mr. Loudon to exist at Strathfieldsay 100 feet high; it is very like the last species, but its leaves become more purple in the autumn. Its wood is of bad quality.

Q. tinctoria, Dyer's Oak, Black Oak, or Quercitron. Leaves downy beneath, obovate-oblong, dilated, widely sinuated; lobes short, obtuse, slightly toothed, bristle-pointed. Cup flat underneath. Acorn globose. A native of Pennsylvania and of the mountains of the Carolinas and Georgia, where it becomes a very large tree, with a bark so dark-coloured as to have gained for it the name of black oak. The leaves are large and very handsome, becoming dull red or yellow in the autumn. Its wood is strong, but very coarse. The inner bark abounds in a yellow dye of great brilliancy, which is known in trade under the name of quercitron; large quantities of it are annually imported from Philadelphia.

Q. Phellos, Willow Oak. Leaves membranous, linear-lanceolate, tapering to each end, entire, smooth, with a small point. Acorn roundish. Low swampy forests on the sea-coast of the southern states of North America. A large tree with something the aspect of a willow, whence its name. Its timber is stated to be strong, but very coarse. Q. laurifolia and imbricaria are nearly related to it.

Q. virens, Live Oak. Leaves coriaceous, elliptic-oblong, revolute, entire, pointless; obtuse at the base, clothed with starry down beneath. Fruit stalked. Acorn oblong. A very valuable species, confined to the Southern States of the North American Union, where it is most abundant upon the shores of creeks and bays. It is also abundant in Texas. The Live Oak yields the best oak of America, the timber being heavy, compact, and fine-grained; and is extensively employed in the American dockyards, although it does not usually acquire a large size. The acorns are stated to be remarkably sweet. It is much too tender to suit this climate, and consequently specimens are to be found only in curious collections in sheltered warm situations.

V. *Oaks of Mexico.*

These are extremely numerous, and must in many cases form highly ornamental trees. Several species have recently been introduced by the Horticultural Society, but we at present know nothing of their habits. It is to be feared that they will in general prove too tender for England.

Q. acutifolia, Sharp-leaved Oak. Leaves heart-shaped, lanceolate, tapering to a very sharp point, with coarse pointed teeth, covered with rusty down on the under side, especially along the principal veins. Young acorns in spikes, which have a short footstalk. Forests of this tree occur on the road from Acapulco to Mexico, where it is called *Aguatle*. It is described as a large tree producing timber of excellent quality.

Q. sideroxyla, the Iron-wood Oak. Leaves oblong, somewhat wedge-shaped, obtuse at the base, armed towards the upper end with sharp-pointed teeth; hoary on the under side. Acorns sessile, ovate, seated in a roundish cup. Found in Mexico, near Guanajuato, and in other places, in barren places 6000 or 7000 feet above the sea. It forms a large tree of great beauty. Its timber is very hard, takes a fine polish, and is extremely durable when used under ground or when sunk under water.

Q. lanceolata, the Lance-leaved Oak. Leaves lance-shaped, entire, wavy, shining on the upper side, strongly bearded beneath at the principal angles of the veins. Acorns ovate, sessile, in goblet-shaped cups. Common in Mexico at the height of 5000 or 6000 feet. It is a large tree, producing a very hard wood, very durable when used under ground, and extensively consumed in mining operations.

Q. glaucescens, Blue-leaved Oak. Leaves on very small stalks, wedge-shaped, obovate, entire near the base, slightly toothed and indented at the edge, glaucous, very smooth. Acorns in racemes. Common in Mexico at the height of 2000 feet above the sea; its wood furnishes the greater part of the charcoal used in that country.

Q. obtusata, the Blunted Oak. Leaves oblong, blunt at each end, unequal at the base, bent inwards near the margin, on the under side strongly veined, and covered with a powdery down. Acorns spherical, in axillary racemes, almost entirely covered by a scaly cup. A fine tree, native of the Mexican mountains 6000 feet above the sea. Wood very compact and strong, and capable of taking a fine polish.

Q. macrophylla, Large-leaved Mexican Oak. Leaves obovate, crenate, tapering and heart-shaped at the base, downy beneath. Fruit spiked. This is doubtless the finest of in the world. It inhabits the southern parts of Mexico and Guatemala, and has leaves 12 to 15 inches long, and broad in proportion. Its acorns are as large as French walnuts; they have been received in this country by the Horticultural Society, but unfortunately would not vegetate.

For detailed information concerning the species of oaks, the reader is referred to Burman's *Flora Javæ*; the article 'Quercus' in Rees's *Cyclopædia*; Webb's *Iter Hispaniense*; Humboldt and Bonpland's *Plantæ Æquinoctiales*; and Loudon's *Arboretum Britannicum*, vol. iv.

QUERCUS PEDUNCULA'TA (Willd.). The bark of this species, the true British oak, is used in medicine. Its appearance varies with the age of the bark, as well as of the tree from which it is obtained. Its excellence is determined by the period of the year when the tree has been barked. The best is obtained from coppice oaks, not from old or full-grown trees, and is better from the branches than the trunk. According to Sir H. Davy, the greatest quantity of tannin exists in the bark in spring, at the time when the buds begin to open (*Agricul. Chemistry*, 4th ed., p. 57), which is confirmed by Biggins. This is the period usually selected to disbark the trees, owing to the greater ease with which it is then effected, the cambium which exists between the bark and wood allowing of their easier separation. The internal cortical layers are much richer in the active principles than the external ones.

Oak-bark is commonly met with in pieces from one to two feet long. That from young stems or branches is generally thin, tolerably smooth, having a silvery or ash-grey cuticle, and frequently clothed with lichens, chiefly of the genus Verrucaria or Opegrapha. When newly detached it is whitish internally, but by exposure to the air it deepens into brown, and becomes fibrous and cracked. The bark of old stems is much thicker, very rough and cracked, and greatly inferior in quality. The chief chemical constituents are: tannin (impure tannic acid), tannates of lime, magnesia, potash, &c., gallic acid, uncrystallizable sugar, pectin, and lignin. It has the peculiar and well known odour of tan, and a bitter astringent but afterwards sweetish mucilaginous taste.

Oak-bark possesses all the properties of astringent substances, except the power of decomposing tartar-emetic. [ASTRINGENTS; ANTIMONY.] It is more employed externally than internally as a wash or injection. By long continued application, it can almost tan the living tissue, and either strengthen a weak part of the skin, or convert a secreting into a non-secreting surface, as in cases of prolapsed or inverted uterus. One of the most valuable applications, and at the same time cheapest, to surfaces threatened with gangrene from pressure, as in fevers, or old bedridden persons, is a wash formed by digesting oak-bark in weak distilled vinegar, and after straining, adding hydro-chloride of ammonia. It is not only unnecessary but injurious to make a *decoction* of oak-bark: no tanner would think of boiling his oak-bark before steeping his hides in it.

Powdered oak-bark with chamomile flowers is a cheap and often effectual mode of checking the paroxysms of ague. (Cullen's *Mat. Med.*; Pereira's *Mat. Med.*)

QUERCUS INFECTO'RIA. [GALLS.]

QUERCY, a district forming part of the antient province of Guienne. [GUYENNE AND GASCOGNE.] It was bounded on the north by Limousin, on the north-east by Auvergne, on the east by Rouergue (another subdivision of Guienne), on the south by Languedoc, on the west by Agenais, and on the north-west by Périgord (the two latter being subdivisions of Guienne). The district of Quercy was subdivided into Le Haut (or Upper) Quercy, which comprehended the chief town Cahors (population 12,417), Gourdon (population 5334), Figeac (population 6237), and other places; and Le Bas (or Lower) Quercy, which comprehended the chief town, Montauban (population 23,865), Moissac (population 10,618), and other towns. The population is according to the census of 1836.

Le Quercy was chiefly comprehended in the territories of the Cadurci, a Celtic people, from whom its name by corruption is evidently derived. It belonged successively to the Visigoths and the Franks; and was in the possession of Waifre, duke of Aquitaine, who was driven from it by Pepin. It was erected into a county by Charlemagne, and subsequently came into the hands of the counts of Toulouse. Having been wrested from these in the wars against the Albigenses, it was ceded to the English, from whom it was taken by Charles V. It is now included in the departments of Lot and of Tarn et Garonne.

QUERE'TARO, a town in Mexico, in the state of Queretaro, is situated near 20° 32′ N. lat. and 100° 10′ W. long., on the table-land of Anahuac, at an elevation of 6,163 feet above the sea. The town with its suburbs contains a population of between 30,000 and 40,000. It is rather a well-built place. The site is not quite level, nor are the streets laid out with much regularity, but they abound with fine buildings and large churches and convents. The finest edifices are the churches of Guadalupe, and the convents of S. Francisco and Santa Clara, the latter of which contains 250 females, consisting of 70 nuns, and as many young ladies sent there for their education, with lay sisters and attendants. In the middle of the town is a great square surrounded with well-furnished shops. The suburbs consist of mud houses, with only one mud floor, and are almost exclusively inhabited by Indians, the number of whom is said to amount to 12,000. The town is well supplied with water from a spring in the mountains, about ten miles distant: the water is conveyed by an aqueduct, which rests on lofty light and bold arches, and its vast extent gives it an air of great magnificence. About three or four miles from the town is one of those deep depressions which frequently occur on the table-land, and which are so much below its general surface that they are partly clothed with the vegetation of a *tierra caliente*. This depression is called El Pareo de la Cañada, and is used by the inhabitants as a place to take their evening walks in.

Cotton and woollen stuffs are made; but these manufactures were formerly of much greater extent than they are at present. Humboldt states that the goods manufactured in this town at the end of the last century amounted annually to 600,000 Spanish dollars (135,000*l.*). Though the cotton-manufactures have much decreased since the ports have been opened and the English have got into the market, there are still made a great number of *mantas* and *rebozos*, or cloaks for men and women. The manufactures are divided into two classes, the *obrajes* and *trapiches*; the former comprise all the establishments that can employ from ten to thirty looms, and the latter those in which only two or three are in activity. Part of the manufactured goods is retailed in the great plaza, where a market is held every evening by torchlight, and part is sent to the capital and other large towns of the Confederation. The woollen-manufactures are now principally kept up by a government contract for supplying the army with clothing. Wool as well as cotton is brought from the states lying farther north, but the best wool is the produce of the state of Queretaro. The town also carries on a considerable commerce in corn and potatoes, as it is situated in the eastern district of the tract called Baxio, which is the richest in agricultural produce in the United Mexican States, and great quantities of corn and potatoes are sent to the mining district, which comprehends the the eastern part of the state.

(Humboldt, *Essai sur la Nouvelle Espagne*; Ward's *Mexico in 1827*; Poinsett's *Notes on Mexico*; Hardy's *Travels in the Interior of Mexico*; *Sketch of the Customs and Society of Mexico*.)

QUERI'NI, A'NGELO MARI'A, CARDINAL, born at Venice, of an illustrious patrician family, in 1680, studied first at Brescia under the Jesuits, and at the age of seventeen entered the Benedictine order. Having become well acquainted with Greek, Hebrew, and biblical learning, he was made instructor of the novices, for whom he wrote a dissertation, 'De Mosaicæ Historiæ Præstantia.' He afterwards travelled during four years in France, England, Holland, and Germany, and enjoyed the society of some of the most distinguished men of those countries. In his 'Commentarii de Rebus ad se pertinentibus,' he gives some account of what he saw, and the conversations he had with many learned men. On his return to Italy, he published several works on liturgic antiquities:—1, 'Vetus Officium Quadragesimale Græciæ Orthodoxæ;' 2, 'Diatribæ ad priorem partem veteris Officii;' 3, 'De Ecclesiasticorum Officiorum apud Græcos Antiquitate;' 4, 'De Hymnis Quadragesimalibus Græcorum;' 5, 'De aliis Canticis Quadragesimalibus.' In the year 1723 Querini was made archbishop of Corfu; and he illustrated the antiquities and history of that island in his 'Primordia Corcyræ' and other works. In 1728 he was transferred to the see of Brescia, and soon after he was made a cardinal, and librarian of the Vatican. It was after his promotion to the see of Brescia that he wrote his literary history of Brescia, 'Specimen Brixianæ Literaturæ quæ post Typographiæ Incunabula florebat,' 1739. He also published the Lives of Paul II. and Paul III., or the former of which he endeavoured to clear the memory of that pope from the charges of Platina and other historians [Paul II., Pope]; and he edited a collection of the epistles of Cardinal Reginald Pole. His other works consist of dissertations upon literary subjects, both sacred and profane, and of numerous epistles, chiefly in Latin. Cardinal Querini was in every respect one of the most distinguished prelates of the Roman church in the eighteenth century. Spotless in his morals, modest and simple in his habits, generous, meek, and charitable, he conciliated the esteem of men of all countries and opinions. Frederic the Great wrote to him in the most flattering terms. Voltaire dedicated to him his tragedy of 'Semiramis' and other works. Querini laboured particularly to improve the town of Brescia, of which he was bishop: he completed the structure of its handsome cathedral, founded a clerical college, a house for female instruction in the Val Camonica, and, lastly, he established the public library of Brescia. He sent donations to Berlin to complete the Catholic church there. By his will he bequeathed his property to benevolent purposes. Cardinal Querini died in 1755, generally regretted. (Corniani, *Secoli della Letteratura Italiana.*)

QUESNOY, LE. [Nord.]

QUEVEDO Y VILLEGAS, FRANCISCO GOMEZ DE, an eminent Spanish satirist, was born at Madrid, in September, 1580, not in 1570, as the authors of the biographical notice printed at the beginning of his translated works (Edin., 1798) erroneously assert. His father Pedro Gomez de Quevedo had been secretary to the empress Mary, and afterwards filled the same situation to Queen Anne, wife of Philip II. His mother Doña Maria de Santibañez was lady of the bedchamber to the queen. Both were of noble family, and descended from the most antient landed proprietors in the Valle de Toranzo. His father having died when he was a child, Quevedo was brought up in the royal palace by his mother. He was sent early to the university of Alcalá, where he made such progress in his studies that he took his degree of doctor in theology at the age of fifteen, a fact which would appear almost incredible. Grown weary of theology, Quevedo applied himself with ardour to the study of civil and canon law, medicine, and natural history; the learned languages, and the various systems of philosophy were also in the number of his acquirements. It is probable that at this period of his life he injured his sight by constant reading, for he was ever after incapable of distinguishing any object at the distance of three paces without the aid of glasses. But neither this deformity nor the crooked legs which he received from nature deterred him from mixing in fashionable society, and being considered a very accomplished cavalier. He is said to have been very gallant towards the fair sex, but exceedingly jealous of his honour and that of his friends; he could wield all weapons of defence with singular dexterity; and as he was endowed with much strength and courage, he remained victorious in several encounters. In one instance however his antagonist, who was a man of quality, having been severely wounded, Quevedo was compelled to quit the court, and repair to Naples, where he was kindly received by the Spanish envoy Don Pedro Giron, duke of Osuna, who not only retained him in his service, but procured his pardon at Madrid. Whilst at Naples, Quevedo executed some very important commissions with which he was entrusted by the viceroy. He crossed the sea seven times as ambassador to Madrid, and went also to Rome on a secret mission. It is even said that he was concerned in the celebrated Bedmar conspiracy at Venice, which city he entered disguised as a beggar. [Venice.] On the fall of his patron, who was recalled to Madrid, and cast into a dungeon, where he ended his days, Quevedo returned to court; but scarcely had he arrived there when he was himself arrested, and confined to his country-seat, la Torre de Juan Abad, upon the charge of being the author of certain libels on the government. After three years of close confinement, Quevedo's papers having been examined, and his innocence proved, he was allowed to revisit the court; but, tutored by experience, he refused many important offices that were offered to him, and continued to lead a country life wholly devoted to literary pursuits. It is probable that at this period he wrote the poems which appeared afterwards under the feigned name of El Bachiller la Torre. He soon after wrote his 'Politica de Dios y Govierno de Christo,' which he dedicated to his patron the Duke of Osuna, and which was printed for the first time at Barcelona in 1629, 8vo. Quevedo was upwards of fifty years of age when he married; but his wife, to whom he was tenderly attached, did not live long. This induced him to revisit Madrid, where in 1641 he was again arrested on the charge of libel, and cast into prison, where he remained for nearly two years. At last Quevedo having appealed for justice to the Conde Duque de Olivares, the all-powerful minister and favourite of Philip IV., his case was for the first time investigated, when it was ascertained that the libellous publication attributed to him was the production of an obscure monk. He was consequently released, and allowed to retire to his country-seat; but the loss of a considerable portion of his fortune, which had been sequestrated during his confinement, and a chronic disease contracted in his prison, shortened his days, and he died some time after, in the neighbouring town of Villanueva de los Infantes, on the 8th of September, 1645, at the age of sixty-five.

Quevedo was undoubtedly one of the best writers of his age; and, with the exception of Cervantes, no Spanish author has ever displayed more originality in his writings. He excelled equally in verse and prose. 'His heroic pieces,' says Nicolas Antonio (*Bib. Nov.*, vol. i., p. 460) 'have great force and sublimity; his lyrics, great beauty and sweetness; and his humorous pieces, a certain easy air, pleasantry, and ingenuity of turn which is really delightful to the reader.' He appears as the rival of Gongora in numerous comic *letrillas* and romances in the old national style. But it is as a prose writer that Quevedo has acquired fame out of his own country. His prose writings are of two sorts, serious and comic: the first consist of pieces written upon moral and religious subjects; the latter are satirical and full of wit and humour; the style however in which they are written is at times so quaint as to be almost unintelligible to strangers. They were nevertheless translated into almost every language of Europe. His *Sueños*, or Visions, enjoyed the greatest celebrity. They consist of various visions of the other world, in which the author sees the end of earthly vanities, and the punishment that awaits crime. Great knowledge of human nature is displayed in them; and as to wit and humour, they are almost inimitable. Shortly after their first appearance (Mad., 1649) they were translated into German by Moscherosch. They were subsequently put into English by Sir Roger l'Estrange (Lond., 1668, 8vo.), and were so well received by the public, that in 1715 there appeared an eleventh edition of them. A new translation of them was published by Pineda (Lond., 1734, 8vo.). Lastly an edition in three volumes small 8vo. was published at Edinburgh in 1798, containing the following works by Quevedo, besides his Visions: 'The curious history of the Night Adventurer,' 'The Life of Paul the Spanish Sharper,' 'Fortune in her Wits,' 'Proclamations by All-Father Time, a treatise of all things whatsoever, past, present, and to come,' Letters on several occasions, &c. The works of Quevedo have been repeatedly printed in and out of Spain. The first edition of his collected works appeared at Madrid in 1649-64, 2 vols. 4to. They were then reprinted at Brussels in 1660-61, 3 vols. 4to., with a portrait of the author, and afterwards at Antwerp in 1669. A princely edition, with many important additions, was published at Madrid, by Harra, in 1772, 6 vols., in large 4to.; but the best is undoubtedly that of Sancho, in 11 volumes, 8vo. (Mad., 1790-94), as it contains much that is not to be found in any of the preceding ones. Several detached pieces by Quevedo, till then inedited, were published about the close of the last century, in the first, third, sixth, and fifteenth volumes of the collection entitled *Semanario Erudito.* A few also of his fugitive poems may be found in the *Parnaso Español.* Quevedo wrote also several dramas and some historical works, but these have been lost to literature. Indeed there is every reason to believe that we possess in print but a small portion of Quevedo's writings, since his friend Antonio de Tarsia, who wrote his life (Mad., 1663), informs us [illegible] 'not a twentieth part of Quevedo's writings had then escaped destruction.'

('Vida de Quevedo por el Abad de Tarsia,' in the [illegible] volume of the 'Obras de Quevedo,' Madrid, 1772; Nicolas Antonio, *Bib. Hisp. Nov.*, vol. i.; Quintana, 'Poesias Selectas Castellanas.')

QUI TAM. In those statutes by which certain acts are prohibited under a penalty, it is usual to encourage the enforcing of the penalty by appointing the whole or some part of it is to be paid to the person who shall take the risk and trouble, and incur the odium, of bringing the matter before a court of law. Where the part of the penalty not given to the informer is directed to be paid over to the poor of the parish, or to be applied for other purposes, the informer may, if he think fit, sue in his own name only; but where a part, commonly a moiety, is given to the king, the proceeding is in the following form: 'A. B., who, as well (qui tam) for our lady the queen as for himself, in this behalf prosecutes, complains,' &c.

When a qui tam or other penal action is commenced, no other person can afterwards sue the defendant in respect of the same offence, whatever the result of the first action may be. It is therefore not unusual for offenders against penal statutes to seek to protect themselves by procuring one of their friends to sue. This however will be of no avail against a subsequent informer suing bonâ fide, provided the fraud and collusion in getting up the first action can be shown.

QUIA EMPTO'RES. [FEUDAL SYSTEM, p. 62.]

QUIBERON. [MORBIHAN.]

QUICK HEDGES. [HEDGE.]

QUICKSILVER. [MERCURY.]

QUIETISM is the name of the doctrine of certain ascetic Christians, who taught that the chief duty of man was to be wrapped up in the continual contemplation and love of God, so as to become totally independent of outward circumstances and of the influence of the senses, and they contended that when a man arrived at this state of perfection the soul had no further occasion for prayer and other external devotional practices. Quietism is in fact the extreme of mysticism and of contemplative devotion. There have been men so disposed in all ages of Christianity, without forming a sect, and even the Mohammedans and Brahmins have their Quietists; but it was a Spanish priest called Michael Molinos, in the seventeenth century, who first embodied the principles of Quietism in his works, which were condemned at Rome, where the author was imprisoned and died in 1696. About the same time Madame Guyon, or Guion, in France, showed herself a great advocate of Quietism. Her maiden name was De la Mothe, and she was of a noble family of Auvergne. She married a wealthy man of the name of Guion, who after a few years left her a young widow with three children and a large property. Madame Guion had been from her youth piously inclined, and after her husband's death she became an enthusiast. Her spiritual director, Father Lacombe, shared the same feelings, and he wrote an ascetic work, entitled 'Analyse de l'Oraison Mentale.' Jean d'Arenthon, titular bishop of Geneva, knew Madame Guion, and esteemed her much, but he did not altogether approve of the vehemence of her zeal, and of her endeavours to introduce her devotional system into various convents. The monks particularly objected to the disuse of external forms of devotion, without which, they contended, it was impossible to keep up the internal warmth of piety, and they contended also that it was impossible to continue in a perpetual state of contemplation. Madame Guion, having fixed her residence at Paris about 1679 or 1680, became acquainted with several ladies of rank, and among others with Madame de Maintenon, and also with the Abbé de Fénélon, who was then preceptor of the young duke of Burgundy. In a work entitled 'Moyen court et très facile de faire Oraison,' Madame Guion insisted upon the necessity of praying internally with the heart rather than with the lips, and she declared that without internal prayer all other religious practices were useless. There seems to be nothing unusual in the title of this work, which has not been recommended by many of the most exemplary Christians and divines, from the age of the apostles to the present day, among whom are several whom the Church of Rome numbers among its saints. Another work of Madame Guion, 'Les Torrents Spirituels,' is a continuation of the former, and she wrote also an interpretation of Solomon's Song, in an allegorical and mystical sense; a task which appeared rather awkward for a pious lady, but which she evidently undertook with all purity and sincerity. Bossuet however thought that there was much reprehensible matter in her works in point of doctrine, and caused her to be confined in a monastery in the year 1688, and obliged her to sign a condemnation of several passages, or rather an explanation of them in an innocuous sense, which she readily did. After six months she was restored to liberty; but she was again arrested, by order of the archbishop of Paris, and sent to the Bastille, where she was detained for several years. The archbishop styled the contents of her books 'a monstrous and diabolical system.' Fénélon undertook her defence, and this led to a hot controversy between him and Bossuet, and ended in the condemnation of Fénélon by Rome in 1699. [FENELON.] Madame Guion was at last liberated, and retired to Orleans to live with some friends. She died in 1717. (*Préface Générale*, prefixed to the *Opuscules Spirituels de Madame de la Mothe Guion*, Cologne, 1704.)

QUIETUS was the son of Macrianus, an officer of distinction in the service of Valerianus. When that emperor was defeated and taken prisoner by the Persians (A.D. 260), the soldiers offered the empire to Macrianus the elder, who refused it on account of his age, but accepted it for his two sons Macrianus the younger and Quietus. In the meantime, Gallienus, the son of Valerianus, had been proclaimed Augustus at Rome; but his authority was not acknowledged beyond the limits of Italy, and numerous usurpers arose in the various provinces of the empire, who have been styled 'the thirty tyrants.' Aureolus, one of these, attacked the two Macriani, father and son, on their march through Thrace, defeated them, and put them to death. Quietus, who was a mere youth, appears to have remained behind in Asia. Being seized by Odenatus, prince of Palmyra, who assumed the command of the Roman armies in the East, he was put to death. (Trebellius Pollio, *Triginta Tyranni*, in *Historia Augusta*.)

Coin of Quietus.
British Museum. Actual size.

QUILIMANE. [MOZAMBIQUE, COAST OF.]

QUILLEBŒUF. [SEINE INFÉRIEURE.]

QUILO'A, called at present by the natives Keelva, is on the east coast of Africa, near 9° S. lat. and 39° 20′ E. long. It was a large town when the Portuguese first visited these countries, and the king held the sovereignty of Sofala, Mozambique, and the intervening parts. In 1505 it was taken by Francisco de Almeida, after a desperate resistance on the part of the inhabitants, which induced him to burn the town. Since that time it has never had any degree of prosperity. At a later period the Portuguese erected a fort, but the bad climate soon obliged them to abandon it. Quiloa is now a miserable village, subject to the Imam of Muskat. Part of the walls of the city still remain in a tolerably perfect state, and there are also the ruins of some extensive buildings. The fort, which still exists, and is garrisoned by the Arabs, is a substantial building of stone, and capable of containing a numerous garrison. The harbour is one of the finest on the coast, but has no anchorage outside, as the water is unfathomable. It consists of a wide basin, which branches off into several arms, which run a considerable distance inland. (Owen's *Narrative of a Voyage to explore the Shores of Africa, Arabia, and Madagascar.*)

QUILON. [HINDUSTAN, vol. xii., p. 204.]

QUIMPER, or more fully QUIMPER CORENTIN, a city in France, chief town of the department of Finistère, one of the departments into which Bretagne has been divided. It is at the junction of the river Benaudet with the Odet, which here becomes navigable; 294 miles in a direct line west by south of Paris, or 319 miles by the road through Versailles, Dreux, Alençon, Mayenne, Fougères, Rennes, Ploërmel, Hennebon, and Quimperlé; in 48° 0′ N. lat. and 4° 9′ W. long.

The name Quimper (Kemper), which in the Celtic tongue denotes 'junction,' indicates that the town is of Celtic origin, and is descriptive of its situation. In the 'Notitia Provinciarum Galliæ,' it appears under the name Corisopiti, or rather that name belonged to the nation whose chief town it was, and who appear to have been either a subdivision of the Osismii, or else subject to them. In the Latin of the middle ages the diocese established here was called Corisopitensis, while the town itself was called Confluentia, which is a translation of its Celtic name. It has been successively called Quimper Odet and Quimper Corentin, and was capital of the county of Cornouailles in the middle ages. In the war of the Breton succession, about the middle of the fourteenth century, Quimper suffered much. Charles de Blois exercised the greatest cruelties there, and the greater part of the inhabitants were slaughtered. It was besieged by the English auxiliaries of De Montfort, but did not surrender till after the decisive victory of Auray, A.D. 1364. In the Breton war, the sequel to the war of the League, Quimper embraced the party of the duke of Mercœur, but submitted in 1595 to Henri IV.

The town is divided into the old town and the new town. The old town, situated on a rising ground, in the angle formed by the junction of the two streams, is surrounded by antient walls and towers: it has narrow streets, with the upper stories of the houses projecting over the street: the quay is lined with houses of Gothic architecture and irregular construction. The new town has wider streets than the old town; it is commanded on one side by rocky heights, rising to the height of 500 or 600 feet, covered with wood and heath, and of picturesque appearance. The cathedral, rebuilt early in the fifteenth century, is one of the noblest churches in France: the other principal buildings are the town-hall, the hospital, the barracks, and the college. There is a public walk.

The population of the commune, in 1826, was 10,032; in 1831, 9860; in 1836, 9715: showing, by its gradual diminution, the decline of the town. Quimper does not appear to have any manufactures except of hats and of coarse earthenware. Small vessels are built. The Odet is navigable up to the town for vessels of 300 tons, and by means of it considerable trade is carried on: the exports are corn, honey, linen and hempen cloth, horses, butter, tallow, and dried or salted pilchards or other fish; the imports are colonial produce and salt. There are thirteen fairs in the year. The pilchard fishery is very actively carried on. The neighbouring country is comparatively sterile: it is chiefly laid out in pasture-ground, in which many horses are reared, of small size, but great speed. Some coal is found, but we are not aware that it is worked. There are a subordinate court of justice and a commercial court, several fiscal government offices, an exchange, a public library of 7000 volumes, a high school, with a collection of the objects of physical science, an agricultural society, a departmental nursery-ground, a theatre, public baths, a seminary for the priesthood, and schools for navigation and drawing.

Quimper was the birth-place of Fréron, a critic and man of letters of some eminence; and of the Jesuits Bougéant and Hardouin [HARDOUIN], the first the author of a history of the wars which preceded the peace of Westphalia.

QUMPERLE'. [FINISTERE.]

QUIN, JAMES, was born in King Street, Covent Garden, on the 24th of February, 1693. His ancestors were of an antient English family, but his father had been settled in Dublin, and his grandfather, Mark Quin, was lord-mayor of Dublin in 1676. There is no account of his mother in any of his biographies; and in 1710, when his father died, James Quin was unable to prove his legitimacy. He was intended for the bar, and educated in Dublin by Dr. Jones of that city. At the age of twenty he came to England, and took chambers in the Temple, but finding his means after his father's death inadequate to his support, he turned his thoughts to the stage, for which profession he possessed many important qualifications, an expressive countenance, a majestic figure, a powerful eye, and a clear, full, and melodious voice. He was introduced by Ryan, the actor, to the managers of Drury-Lane Theatre, and engaged, in 1717, to appear in the course of the ensuing winter. A tavern brawl, connected with an intrigue, involved him in law proceedings, and he was compelled for a short time to retire to Ireland. On his return to London he made some sensation in the part of Bajazet, at Covent Garden; and in 1720 made his first great hit in the character of Falstaff. He was considered at the head of his profession till Garrick made his appearance, of whom he at first spoke contemptuously.

In 1746 these two great rivals performed together in the 'Fair Penitent,' and in 1748 Quin retired from the stage, but annually performed Falstaff for the benefit of his old friend Ryan, till the year 1754, when, having lost two of his front teeth, he declined appearing, declaring that he 'would whistle Falstaff for no man.' Quin died at Bath, on the 21st of January, 1766. He was a master of elocution, and was engaged in that capacity by Frederick, Prince of Wales, to instruct his son Prince George, afterwards George III. Quin's exclamation of 'I taught the boy to speak,' on hearing his majesty deliver his first speech from the throne, has been quoted more frequently than any of his jokes, although both for number and humour they would of themselves form a capital jest-book. He was a great epicure, and his manners were sometimes coarse and overbearing; but it should never be forgotten that he released Thomson, the author of the 'Seasons,' from a spunging-house by paying the debt and costs for which the poet was incarcerated, without having had any personal acquaintance with him. A full-length portrait of Quin, in a splendid suit of scarlet and gold, is amongst the collection of the late Mr. Mathews, at the Garrick club.

QUINA or **QUINIA**, a most important vegetable alkali, contained in the three well-known varieties of Cinchona, or bark, but principally in the yellow bark. This alkali was discovered in 1820, by Pelletier and Caventou, and they showed the process for obtaining it in its separate state. This alkali may be obtained from yellow bark by a process similar to that already described for procuring Cinchonia [CINCHONIA] from pale bark. It exists combined with excess of kinic acid, forming superkinate of quina. We are inclined to believe that the best process, with some slight modifications, is that proposed in the last edition of the *Edinburgh Pharmacopœia*, 1840. This consists in boiling the bark in a solution of carbonate of soda, so as to extract its colouring and resinous matter, treating the residue with sulphuric acid so as to obtain sulphate of quina, which is to be decomposed by carbonate of soda, and the precipitated quina being redissolved in sulphuric acid and water, and treated with animal charcoal, is to be evaporated to its crystallizing point.

The best method of preparing pure quina is to decompose a solution of the pure sulphate, or rather disulphate, of quina by ammonia, and to wash and dry the precipitate. Its properties are, that it is colourless, inodorous, and extremely bitter. It fuses at about 300° Fahr., and when cold is yellow, translucent, friable, and somewhat like resin. Boiling water dissolves only 1-200th of its weight of quina, and cold water a much less quantity. It is readily dissolved by alcohol, and when a solution in alcohol of sp. gr. 0·815 is set to evaporate spontaneously in a warm place, crystals of hydrate of quina are obtained, containing one equivalent of water. The alkaline property of quina is shown by its restoring the blue colour of reddened litmus, and by saturating and forming crystallizable salts with acids. Quina is soluble in æther, and slightly also in the volatile and fixed oils when they are heated. When subjected to a strong heat with access of air, it is totally dissipated, with the formation of the vapour of carbonate of ammonia; and if there be any residue after the action of the heat is over, it is owing to some impurity.

Quina is composed of—

Twelve equivalents of hydrogen	12	or	7·4
Twenty equivalents of carbon .	120	„	74·0
Two equivalents of oxygen .	16	„	9·9
One equivalent of azote .	14	„	8·7
Equivalent	162		100·0

We shall mention a few of the more important salts of quina, premising that the only one extensively employed is the disulphate, the *Quinæ disulphas* of the London Pharmacopœia, and the *Quinæ sulphas* of the Edinburgh.

Sulphate of Quina.—This salt may be prepared by crystallizing a solution of sulphate of quina, the acid of which has not taken up as much of the alkali as it is capable of combining with. This salt crystallizes in square prisms, effloresces when exposed to the air, is soluble in 11 times its weight of water at 55°, and in 8 times at 72°; it is also dissolved by alcohol. At 212° it fuses in its water of crystallization. This salt, though neutral in composition, is acid to litmus paper, but not sour to the taste. By the action of heat in the air it is totally decomposed and dissipated.

It is not employed in medicine, and is composed of—

One equivalent of sulphuric acid .	40	or	14·6
One equivalent of quina . .	162	„	59·1
Eight equivalents of water . .	72	„	26·3
Equivalent	274		100·0

Disulphate of Quina.—This is prepared by adding the alkali to the acid till it is incapable of combining with more. The crystals of this salt are colourless, acicular, have a pearly lustre, a bitter taste, and effloresce when exposed to the air; one part requires for solution about 740 parts of cold or 30 of boiling water, 80 of cold alcohol of sp. gr. 0·850, and much less of boiling. When heated, disulphate of quina becomes luminous, fuses, and on cooling has the appearance of melted wax; it afterwards reddens, begins to decompose, and when the heat is raised to ignition in the air, charcoal is obtained, and this, if the salt is pure, is eventually entirely dissipated without residue. It is one of the remarkable properties of this salt to give a blue tinge to water; by the addition first of chlorine, and then of ammonia, it becomes of an emerald green colour.

It is composed of—

One equivalent of sulphuric acid	40	or	9·17
Two equivalents of quina . .	324	„	74·31
Eight equivalents of water .	72	„	16·52
Equivalent	436		100·00

Nitrate of Quina.—When the solution of this salt is evaporated to a certain point, oleaginous drops are formed, which resemble wax in appearance when they have solidified. When they are kept some days under water, they gradually alter in appearance, and are converted into groups of regular brilliant crystals, and it often happens that one drop becomes a single crystal. This phenomenon depends upon the circumstance that the salt when deposited hot is fused, and contains no water of crystallization, but gradually combines with it to form crystals; the crystals are rectangular prisms with inclined bases, and do not possess any cleavage.

Hydrochlorate of Quina.—This salt crystallizes in silky or pearly tufts. It is slightly soluble in water, but more so than the neutral sulphate of quina. It fuses below 212°. There are probably two hydrochlorates, corresponding to the two sulphates of this alkali; the neutral salt consists of—

One equivalent of hydrochloric acid	37
One equivalent of quina . .	162
	199

Oxalate of Quina.—This salt is obtained by precipitating a soluble salt of quina by a neutral oxalate; it is procured in the state of a white powder, which is but slightly soluble in water when cold, but more soluble in boiling water, and as the solution cools, the salt is deposited in silky crystals. It is very soluble in alcohol, especially when heated, and the salt crystallizes as the solution cools. When excess of acid is added to the oxalate, it dissolves readily in water, and crystallizes in needles.

Gallate of Quina.—This salt precipitates in the state of a white powder, when a soluble gallate is added to a solution of a salt of quina. It is soluble in hot water, but precipitates as the solution cools; it dissolves readily in excess of acid and in alcohol. This salt is produced when infusion of galls is added to infusion of yellow bark.

Kinate, or rather *Superkinate of Quina*, is the salt which exists naturally in the bark. It is crystalline, and may be obtained by spontaneous evaporation in mammellated white crusts, which sometimes consist of small needles that lose their transparency by exposure to the air, and assume a horny appearance. This salt is very bitter, slightly soluble in alcohol, but very soluble in water.

The salts of quina in general are distinguished by their strong taste of Cinchona, and by their pearly lustre; the greater number are soluble in water, and some are soluble also in alcohol and æther. The soluble salts are precipitated by the oxalic, tartaric, and gallic acids, by the salts of those acids, and also by the alkalis and alkaline earths.

QUINAULT, PHILIPPE, born at Paris in 1635, studied the law, and afterwards followed it as a profession for a time, but owing to his inclination to poetry, he neglected it, and began to write for the stage. He wrote several tragedies and comedies for the Théâtre Français, which are now forgotten. About 1673 he began writing plays for the Grand Opera, which his friend Lulli set to music [LULLI]; and it is on this kind of composition, which partakes strongly of the lyric, that Quinault's reputation as a poet was established. He is considered the first writer of French operas; the attempts made before his time by Perrin were below mediocrity. A. W. Schlegel observes that 'Quinault, though now almost forgotten, is nevertheless highly distinguished for his lyric tragedies;' and the same critic adds that he prefers his manner and style of composition, light, animated, and fantastic, to that of the great Italian melodramatist Metastasio. The opera of 'Armide' is considered Quinault's master-piece. Louis XIV. bestowed on Quinault the order of St. Michael, with a pension of 2000 livres, and the French Academy and the Academy of Inscriptions and Belles-Lettres numbered him among their members. At Lulli's death, in 1687, Quinault ceased to write for the stage, and he died the following year, leaving a considerable fortune among his daughters. All his dramas have been collected and published: 'Le Théâtre de M. Quinault, contenant ses Tragédies, Comédies, et Opéra, édition augmentée de sa Vie, et d'une Dissertation sur ses Ouvrages et sur l'Origine de l'Opéra,' 5 vols. 12mo., Paris, 1715.

QUINCE. The fruit so called is the *Cydonia vulgaris* of botanists, of which there are three varieties, the apple-shaped, pear-shaped, and the Portugal quince. The last is by some reckoned a species. There are also some sub-varieties of the others. The quince-tree is used, and chiefly propagated in this country, for furnishing stocks for grafting with such pears as are intended to be grown as dwarfs, or when early fruiting is desired. The Portugal quince is to be preferred for this purpose, as its growth corresponds nearer with that of the pear than the other smaller-leaved sorts. It is also better for the domestic purposes to which the fruit of the quince is applied, such as marmalade and syrups or jellies. The propagation of the trees is easily effected by layering. As the tree vegetates early, it should, when used as a stock, be grafted as soon as the weather will permit. From this not being attended to, a want of success has occasionally been complained of. The stocks should be headed down even as early as January. Quinces are best adapted for light and rather moist soils. In dry soils the pears grown upon them are rendered gritty. [CYDONIA.]

QUINCTILIA'NUS, MARCUS FA'BIUS, is said by Jerome (*Chron. Euseb.*) to have been a native of Calagurris (Calahorra), a town in the northern part of Spain, and to have been brought to Rome by Galba, on the death of Nero, A.D. 68. There is however sufficient evidence in the works of Quinctilian to prove that he was educated if not born at Rome; and it is certain that he must have lived at Rome at least as early as A.D. 59. He describes himself as an adolescentulus (*Orat. Inst.*, v. 7, p. 271, ed. Bipont) and juvenis (*Id.*, x. 1, p. 212) when he heard Domitius Afer, who died, according to Tacitus (*Ann.*, xiv. 59), in that year. Dodwell, in his 'Annales Quintilianei,' maintains that Quinctilian was born at Rome in the beginning of the reign of Claudius, about A.D, 42, and accounts for the statement of Jerome by supposing that Quinctilian accompanied Galba to Spain, and returned with him to Rome on the death of Nero. That Quinctilian was not born in Spain is confirmed by the fact that Martial, who was himself a native of Spain, and speaks of most of his fellow-countrymen who were in any way eminent, never mentions Quinctilian as such; in addition to which, Quinctilian himself speaks of his father as if he had been an orator at Rome (*Inst. Orat.*, ix. 3, p. 169). It is thought by some writers that M. Seneca alludes either to the father or grandfather of Quinctilian, in the fifth book of his 'Controversiæ' (*Præf.*, p. 327, ed. Bipont).

Jerome says (*loc. cit.*) that Quinctilian was the first rhetorician who received a salary from the fiscus, which must have been first given him in the time of Vespasian. (Suet., *Vesp.*, 18.) He practised as an advocate with great reputation (*Orat. Inst.*, ii. 12, p. 114), and also taught rhetoric for twenty years (*Id.*, Præf. in lib. i.), to both of which occupations Martial alludes in an epigram (ii. 90) addressed to him:—

> 'Quinctiliane, vagæ moderator summe juventæ,
> Gloria Romanæ, Quinctiliane, togæ.'

After retiring from his profession, he was entrusted by Domitian with the education of the nepotes of his sister (*Inst. Orat.*, Præf. in lib. iv., p. 210), and about the same time wrote his great work on the education of an orator. We are ignorant of the time of his death; Dodwell supposes that he lived till the beginning of the reign of Hadrian, and that this emperor bestowed upon him the consular ornaments, which we know were granted to him at some period of his life. (Ausonius, *Grat. Actio*, p. 290, ed. Bipont.) Juvenal (vii. 192) also speaks of his being a senator.

In the preface to the sixth book of his work on the instruction of an orator, Quinctilian bitterly laments the death of his wife and two sons, and complains that there was no providence in the government of human affairs. His wife died in her nineteenth year, and his younger son in his fifth, soon after the death of his mother. The elder lived to the age of ten, and died while Quinctilian was engaged in his great work. It appears however that he mar ried again, or that he had a daughter, whom he has omitted to mention; since Pliny the Younger, in a letter to Quinctilian (*Ep.*, vi. 32), speaks of a daughter of his, who was to be married to Nonius Celer.

Quinctilian was the most celebrated teacher of rhetoric in his time. The younger Pliny was one of his pupils (*Ep.*, vi. 6), as well as many other eminent men.

Quinctilian complains that many works had been published under his name without his consent. He particularly mentions two books on the art of rhetoric, which had been taken down by his pupils and afterwards published from their notes (*Inst. Orat.*, Præf. in lib. i.); and he also says that several of his speeches were published in the same way from the notes of the shorthand writers (vii. 2, p. 21). According to Juvenal (vii. 186, &c.), Quinctilian acquired great wealth by his profession, but Pliny (*Ep.*, vi. 32) speaks of him as in moderate circumstances. Juvenal however appears to speak of his wealth in comparison with other rhetoricians, while Pliny perhaps compared it with his own fortune.

Quinctilian's work on the education of an orator ('Institutio Oratoria') was written, as already stated, in the reign of Domitian, upon whom he bestows the most extravagant flattery in the preface to his fourth book, and invokes his assistance as a god in the composition of the work. It is dedicated to Marcellus Victorius, whose son he had educated, and it was undertaken chiefly for the instruction of his own son, who died before it was finished. (*Præf.* in lib. vi., p. 342.) It is divided into twelve books, and its object is not merely to give the chief rules of the art of rhetoric, but also to point out the course of education which an orator should pursue. He gives an outline of the whole work in the preface. The first book, he says, treats of those subjects which must be studied before rhetoric. In the second, the elements of rhetoric are discussed; and in the five following *inventio*, in which *dispositio* is included. Elocutio, memory, and pronunciation form the subject of the four next; and the last is devoted to a discussion of the qualifications necessary for an orator, and of the manner in which causes should be pleaded.

The first book is perhaps the most interesting to us, as it gives us some knowledge of the manner in which a respectable Roman youth was educated. Quinctilian commences by saying that the education of the orator should begin from his infancy, and recommends that the nurses and all persons about the child should have a correct pronunciation. He says that it is better to learn Greek before Latin, as the latter will be easily acquired from its being the language of the country; but he disapproved of the plan adopted by many of only allowing Greek to be spoken for a long time, since thereby the child acquired the Greek accent and Greek idioms in speaking his own language. He recommends a public school in preference to home education, as the emulation of public schools is sufficient to counterbalance any disadvantage arising from the number of the boys and the consequent inability of the master to give them his undivided attention, as in the case of a single pupil; and he replies at some length to the objection that public schools are injurious to morals, and maintains that a boy incurs as much danger of having his morals injured at home as at school. He recommends the master however to study well the disposition of each boy, and he strongly disapproves of corporal punishment. At the grammar-school, the pupil is to learn the art of speaking correctly, and also to study the antient authors, beginning first with the poets, and afterwards proceeding to the historians. Before going to the school of the rhetorician, the pupil must acquire a knowledge of music and geometry; and he also recommends him to receive some instruction in pronunciation from the comic actors, and in gesture and attitude from the masters in the Palæstra.

After passing through this course of education, Quinctilian considers the pupil competent to enter the school of the rhetorician, and accordingly in his second book he gives the first elements of the art of rhetoric. He thinks that the pupil should not attempt to speak extempore at first, but should confine himself to written exercises, which should first consist of narrations of real facts, and afterwards of panegyrics of illustrious men and dispraise of the wicked. After recommending some other subjects for written compositions, he points out the advantages attending a careful study of the best historians and orators under a master, who would point out their principal beauties and defects. In choosing subjects for declamation, he condemns the practice, which was common in his time, of taking them from the works of the poets, the answers of oracles, &c., and maintains that they should be confined as much as possible to such matters as the orator would afterwards be engaged upon in the courts. At the conclusion of the book he defines rhetoric to be the art of speaking well, and proves that it ought to be regarded as an art and a virtue (virtus), and that it comprehends all subjects which can be discussed.

The first two books are only introductory; in the third Quinctilian commences the principal subject of his work, namely, the art of rhetoric. He says that it consists of five parts, *Inventio*, *Dispositio*, *Elocutio*, *Memoria*, *Pronuntiatio* or *Actio*. He divides all causes into three kinds, the *Demonstrative* or *Panegyrical*, the *Deliberative*, and the *Judicial*. The demonstrative or panegyrical treats of subjects requiring praise (*laus*) or blame (*vituperatio*), and is frequently employed by the orator, as in funeral orations, recommending or attacking witnesses, &c. The deliberative consists of persuasion (*suadendi*) and dissuasion (*dissuadendi*), and is confined by Greek writers to speeches made in the assemblies of the people; but, according to Quinctilian, may be employed in many other speeches. The judicial consists in accusation (*intentio*) and defence (*depulsio*), and is divided by Quinctilian into the prooemium, narratio, probatio, refutatio, and peroratio. All suits, Quinctilian says, are respecting one thing or more than one. The former are called *simplices*, as in the case of theft, adultery, &c.; and the latter *conjunctæ*, as in the case of extortion (pecuniæ repetundæ), or when a person is accused of more than one crime at the same time. He also says that there is another species of law-suits, called the *comparative*, as for instance when the matter in dispute in the court of the Centumviri is, which claimant is more worthy of the inheritance; or when, in the case of a divinatio, it has to be decided who is to be the real or chief accuser; or when two informers both claim the reward.

In the fourth and fifth books Quinctilian treats of the prooemium, narratio, probatio, and refutatio, in judicial causes; and remarks, that the probatio is the most important. He divides proofs into *inartificial* and *artificial*: under the former he includes previous judgments (præjudicia), common reports (rumores), torture of slaves (tormenta), legal instruments (tabulæ), oaths (jusjurandum), and witnesses (testes); by artificial proofs he means those which the orator brings forward from the subject, and to a certain extent invents himself. Præjudicia, says Quinctilian, consist of three kinds: 1st, *exempla*, or precedents, that is, similar cases, which have been already decided; 2, *judicia* which have been passed on matters relating to the cause; and 3, *judicia* which have been already given on a previous trial of the cause. Witnesses, Quinctilian says, give their testimony in writing (per tabulas) or by word of mouth in open court; and he discusses at considerable length the best modes of examining and cross-examining witnesses.

In the sixth book Quinctilian treats of the peroratio in judicial causes; and in the seventh, of the dispositio, the second of the five parts into which he divided the art of rhetoric. He defines dispositio to be a proper distribution of the different materials and parts of a speech into their proper places.

In the eighth book he treats of what he calls elocutio, which, he says, all orators consider to be the most difficult part of their art. He recommends the orator to pay more attention to the argument of his speech than to the mere words which he should use; and maintains that those words are the best which best express our meaning, and produce in the minds of the judices the effect that we desire. He then proceeds, in the remainder of this book and in the three following, to explain all the different subjects comprehended in elocutio, as perspicuity, ornament, amplification, metaphors, &c., and gives directions for acquiring the art of extempore speaking. In the latter part of the eleventh book he briefly discusses the fourth and fifth branches of rhetoric, namely, memory and pronunciation.

In the twelfth book he treats of the qualifications necessary for an orator, and maintains that no one who is not virtuous can be a perfect orator; and that a knowledge of philosophy, civil law, and history is necessary to the orator. He also gives some general directions respecting the manner in which causes should be studied and pleaded in court; and points out the kind of eloquence which the advocate should use.

The first complete MS. of the 'Institutes' of Quinctilian was discovered in the year 1417, by Poggio [BRACCIOLINI], in the monastery of St. Gall, which is about twenty miles from Constance. Poggio has given an interesting account of the discovery of this MS. in a letter to Guarinus, which is reprinted in Fabricius's 'Bibliotheca Latina,' edited by Ernesti (vol. ii., p. 259). On the revival of learning, the Institutes of Quintilian were studied almost more than any other Latin author, and lectures on rhetoric were at that time confined to an interpretation of Quintilian's work, which accounts for the number of editions which were published in the fifteenth and sixteenth centuries. The professor in the university of Leipzig, who is now called professor eloquentiae, formerly bore the title of Quintiliani professor.

Besides the Institutes, there are certain Declamationes which are usually published under the name of Quintilian. Of these there are nineteen of considerable length, and one hundred and fifty-four much shorter, which are said to have originally consisted of three hundred and eighty-eight. The latter were probably written by a different person from the author of the former, and neither of them by Quintilian himself. Quintilian tells us that he only published one oration himself. (*Orat. Inst.*, vii. 2, p. 21.) Some modern writers suppose that the shorter Declamations were published by Quintilian's father, who is spoken of by his son as an orator (ix. 3, p. 109), or by the Quintilian mentioned by Seneca (*Controv.*, Praef. in lib. v.); but there are insufficient reasons for either opinion.

Quintilian also wrote a work on the causes of the corruption of eloquence (*De Causis Corruptae Eloquentiae*; *Orat. Inst.*, Praef. in lib. vi., p. 343), which some critics imagine to be the work entitled 'De Oratoribus, sive de causis corruptae eloquentiae dialogus,' which is usually printed with the editions of Tacitus. The latter work however could not have been written by Quintilian, as we find him saying, at the end of the eighth book of his Institutes, that *he* had treated fully the subject of hyperbole in his work 'De Causis Corruptae Eloquentiae;' whereas the subject is not mentioned in the 'Dialogus de Oratoribus.' Respecting the author of this work see TACITUS.

The best critical edition of Quintilian's Institutes is by Spalding, Leipzig, 1798-1816, 4 vols. 8vo., to which an additional volume of notes was added by Zumpt, Leipz., 1829, 8vo., and a *Lexicon Quintilianeum*, by Bonnell, Leipz., 1834, 8vo. The editions of the Institutes by Lünemann, Hannov., 1826, 2 vols. 8vo., and Zumpt, Leipz., 1831, 8vo., may also be recommended. The best editions of the Institutes and Declamationes together are by Burmann, Leyden, 1720, 2 vols. 4to.; and the Bipont, 1784, 4 vols. 8vo. There is also an edition of the Institutes and Declamationes by Dussault, Paris, 7 vols. 8vo.

The Institutes have been translated into English by Guthrie, Lond., 1756, 2 vols. 8vo., and Patsall, Lond., 1774, 2 vols. 8vo.; into French by Mich. de Pure, Paris, 1663, 4to., and Nic. Gedoyn, Paris, 1718, 4to.; and into German by Henke, Helmst., 1775-1777, 3 vols. 8vo., of which a new edition was published by Billerbeck, Helms., 1825, 3 vols. 8vo.

For further information respecting the life of Quintilian, the reader is referred to Dodwell's 'Annales Velleiani, Quinctilianei, Statiani, s. vitae C. Velleii Paterculi, M. Fabii Quinctiliani, P. Papinii Statii, pro temporum ordine dispositae,' Oxon., 1698, 8vo.

QUINCY. [MASSACHUSETTS.]

QUINDECAGON, a figure of fifteen sides.

QUINSY, or Cynanche, or Angina, is an inflammation of the throat. Nosologists, having applied the name of *cynanche* to nearly all the inflammatory diseases in this part, have been obliged to distinguish the different affections of the several organs included in it, by specific names; hence we have cynanche parotidea, another name for mumps; C. trachealis, which is croup; C. pharyngea, or inflammation of the pharynx; C. tonsillaris, or inflammation of the tonsils; and many other species, named either from the organ chiefly affected, or the character of the inflammation. Of these, mumps and croup having been treated of in separate articles, the present may be devoted to the two last mentioned, which are indeed those that are commonly intended by the popular name quinsy.

Cynanche pharyngea, or inflammation of the mucous membrane lining the back of the mouth and the upper part of the throat, is that which usually exists in a common sore-throat, brought on, as it most frequently is, by a change in the weather, or by sitting in cold or damp air. It is usually a mild disease, and chiefly annoying from its liability to recur on slight occasions. The extent of the inflammation varies greatly in different cases; it may be confined to the pharynx, or it may spread from it over the soft palate and the tonsils, and into the cavities of the nose, where it produces the additional symptoms of a cold, or into the tympanum [EAR], giving rise to deafness. On examination, the back of the mouth and fauces, when thus inflamed, will be found unnaturally red and swollen, and often covered with tough mucus or lymph; and from these changes there result dryness and soreness of the throat, pain in swallowing, and a sensation as if the diseased parts were closely constricted.

A common sore-throat does not need much treatment; warmth, gentle purgatives, and sweating medicines, the avoidance of stimulating food, and the inhaling of the vapour of hot water, or hot vinegar and water, or the application of a large poultice round the throat, will usually effect its removal in a few days. Sometimes however the disease is prolonged in a slight but obstinate form, which is commonly called a relaxed sore-throat. In this condition the redness of the parts affected is still observed, but it is of a less vivid colour, and is irregularly streaky, instead of being evenly diffused; the velum also, which is commonly implicated, is elongated, and it is from its unnatural contact with the back of the tongue and the epiglottis that the tickling sensation in the throat arises, and excites a constant desire to swallow or to cough. For this condition the necessary treatment consists of stimulating gargles, such as hot wine, infusion of Cayenne pepper, very diluted mineral acids, &c., and if the patient be in general ill health, tonics and appropriate alteratives.

In more severe cases of inflammation of the pharynx and adjacent parts, matter sometimes forms either around or near the pharynx, or in the soft palate or the uvula. Wherever the existence of matter can be determined, it should be immediately let out, as from an abscess in any other part of the body. In other severe, and in some measure peculiar, cases, the intensity of the inflammation is marked by the formation of false membranes on the affected surface. This form of the disease has been named angina membranacea, and has been especially described by M. Bretonneau and other French physicians under the name of *diphtherite*. In its essential nature this affection resembles croup, with which also it is sometimes connected, the false membrane being not only spread over the mucous surface of the pharynx and fauces, but extending down into the trachea. In some cases the inflammation is very acute, and, being accompanied by common inflammatory fever, requires for its reduction the most active antiphlogistic treatment; the same measures, in short, as are applicable in cases of croup. [CROUP.] In another severe form of quinsy, the inflammation and formation of false membranes are accompanied by a low typhoid state with great prostration of strength, and requiring all the remedies that are used in cases of low typhus fever, in malignant scarlet fever, and other dangerous diseases of the same class. It is this form of disease which is usually called putrid or malignant sore-throat, and by nosologists, cynanche or angina maligna. It sometimes occurs as an epidemic, and was long regarded as attended by sloughing of the throat, the layers of false membrane being mistaken for the inflamed tissue in a state of gangrene.

In cynanche tonsillaris or tonsillitis, the inflammation is entirely or nearly limited to the tonsils. Its symptoms are scarcely distinguishable from those of the common form of the preceding disease, but on examining the throat the redness is seen to be less diffused, and the tonsils, being more or less increased in size, are approximated to each other so as nearly to block up the posterior aperture of the mouth, and render any effort to swallow extremely painful. Hence, to avoid the pain, the patient usually lets the saliva flow from his mouth, and often, in attempting to swallow, is unable to overcome the obstacle presented by the enlarged tonsils, and discharges the fluid back through the nose. In many cases also the inflammation extends to the eustachian tube and tympanum [EAR], producing deafness, and to the parts immediately around the larynx, giving rise to difficulty of breathing and a harsh hoarse sound of the voice. With these local symptoms there is usually more or less fever, with headache, loss of appetite, &c.

The milder cases of inflammation of the tonsils may be treated in the same manner as those of the preceding disease; leeches applied to the sides of the throat where the pain is most severely felt, are probably the most beneficial means that can be employed. With a higher degree of inflammation abscesses often form in the tonsils, accompanied by all their usual signs, and with still greater obstruction in the throat. In time these will break of themselves, but it will materially shorten the patient's sufferings if they be opened as soon as matter has distinctly collected. The operation should be performed with a guarded knife, or with one that slips through a canula and can have the length of its cutting part fixed.

The most annoying result of repeated inflammation of the tonsils (and those who have once suffered are peculiarly liable to a recurrence of the disease from very slight causes), is, that they become permanently enlarged. In this state, although swallowing is not painful, it is often attended with difficulty, and by the partial closure of the fauces the respiration is always obstructed and requires an effort for its effectual performance. From this, in children, a peculiar deformity of the chest often results, the breast-bone and the fronts of the ribs becoming elevated and very much arched forwards, in a form which is commonly called chicken-breasted. But if this do not occur, the patient always suffers inconvenience from hoarseness and a kind of nasal sound of the voice; he cannot avoid snoring very loud in his sleep, and often starts up from it with a feeling of impending suffocation. The best means for the removal of this state are astringent gargles, as those with alum, oak-bark, mineral acids, &c. Iodine also, administered internally and rubbed on the throat, often proves useful; but in many cases nothing will alleviate the condition of the patient but cutting off a portion of each tonsil, so as to reduce them to their natural dimensions.

QUINTAL generally means the weight of a hundred pounds; but the term is not now English.

QUINTILE, a term of astrology and antient astronomy, meaning distant in longitude by 72 degrees, or the fifth part of the whole great circle.

QUINTIN. [Côtes du Nord.]

QUINTUS CA'LABER, a Greek poet, who owes his name of Calaber merely to the circumstance that towards the close of the fifteenth century Cardinal Bessarion discovered his poem in the library of a monastery at Otranto in Calabria. The poet in his own work (xii. 304, &c.; comp. iii. 233; i. 295; x. 128: Tzetzes, *Chil.*, ii. 489, &c.) calls himself a native of Smyrna, and describes himself as having in his youth been a shepherd in the neighbourhood of this city. Hence he is more properly called Quintus Smyrnæus. The original MS. bears only the name of Koïntos, and it has been supposed that this is not the name of the author, but of the person to whom the MS. belonged. Under such circumstances it is not to be expected that anything respecting his life and the time in which he lived should be known, beyond what can be inferred from the character of the work itself and some allusions which occur in it. Some scholars, led away by single beauties in the work, and the richness of expression and imagery, have ascribed it to Homer himself, or some of the cyclic poets, while others have conceived him to have been a contemporary of Augustus. The most probable opinion however is that he lived in the fifth century of our æra, in the reign of the emperor Zenon or Anastasius, and that he was a contemporary of Tryphiodorus and Coluthus, whose poems were contained in the same MS. in which that of Quintus was discovered. In confirmation of this opinion we may refer to lib. xii., 335, &c., where Calchas is represented as foretelling the greatness of Rome, in a manner which can only apply to the latter period of the Roman emperors (comp. vi. 533).

His poem, which is called 'Homeri Paralipomena,' or 'Posthomerica' (for the original MS. has no title), contains in fourteen books those events of the Trojan war which are not described in the Iliad, and it is intended to be a completion and continuation of Homer. The source from which the poet derived his materials are chiefly the so-called cyclic poets. In style and language he imitated the Homeric poems; but an accumulation of *single* beauties, and the deficiencies of the work as an artistical whole, betray the age of the author.

There are several MSS. of the poem of Quintus, but all seem to be more or less correct copies of that discovered by Bessarion. The first edition of Quintus, together with Tryphiodorus and Coluthus, was printed at Venice by Aldus (about 1505). A new edition, with a Latin translation by Rhodomannus, appeared in 1604, at Hanover. In the edition of De Pauw (Lugd. Bat., 1734) the translation of Rhodomannus was reprinted. In 1783, Tychsen published a very good dissertation on Quintus and his poem, which was followed in 1807 by a new and much improved edition of the text of the 'Posthomerica' of Quintus Smyrnæus. The second volume, which was to contain the commentary, has never been published. The poem of Quintus has been translated into French by R. Tourlet (Paris, 1800, in 2 vols.). In 1821 there appeared at Oxford 'Select Translations from the Greek of Quntius Smyrnaeus,' by Alexander Dyce. (Compare Spitzner, *Observationes critic. et grammat. in Quinti Smyrnæi Posthomerica*, Lipsiæ, 1837.)

Besides the 'Posthomerica,' Brunck (*Analect.*, ii., p. 475) attributes to Quintus some verses in the 'Labours of Hercules.'

QUINTUS CU'RTIUS RUFUS. Nothing whatever is known from extrinsic evidence of the personal history of Quintus Curtius or of the time when he lived; nor is there a single passage in his work from which anything can be deduced with certainty. A passage in the tenth book (c. 9) appears to allude to some great calamity that had threatened the Roman state, and which had been averted by the emperor (princeps suus); but the name of the emperor is not stated. In the absence of all proof, it has been supposed that this Curtius may be the rhetorician of whom Suetonius is said to have treated, though that part of his work on rhetoricians is not extant; or that he may be the Curtius who was praetor and proconsul of Africa under Tiberius. (Tacit., *Ann.*, xi. 20.) Cicero also speaks of several persons of the name of Curtius, and he names one of them Quintus. But there is no proof that any of these persons is the Curtius who wrote the 'History of Alexander,' though the rhetorical style of the work would justify us in assigning it with some degree of probability to a rhetorician. One of the best examples of the declamatory style of Curtius is the well known speech of the Scythian ambassadors to Alexander (vii., c. 8).

The work of Quintius Curtius is entitled 'De Rebus Alexandri Magni Regis Macedonum,' or the 'Acts of Alexander the Great, King of the Macedonians.' It was originally in ten books, of which the first two are lost; the third book begins with the attack of Alexander on Celænæ. There seems also to be something wanting at the end of the fifth and the beginning of the sixth book; and perhaps there are some omissions in the tenth book also. There are various modern supplements to Curtius, but that of Freinshemius, who has laboriously supplied the first two books, appears to be the best.

The most opposite judgments have been passed on the work of Curtius. Some prefer him to Tacitus, and others place him, as to style, on a level with the writers of the Augustan age. Others again allow him little merit. Considered as an historian of Alexander, he was evidently deficient in essential qualities: he was not a critical writer, and he was very ignorant of geography. His style is perspicuous and easy, though rhetorical and ornate, and if he did belong to a late age (which is at least doubtful), he wrote better than his contemporaries. The work accordingly is much more suitable for elementary instruction than many other Roman writers; for instance, it is in all respects infinitely superior to the wretched collection of biographies which passes under the name of Nepos. Though somewhat diffuse, and not free from affectation of ornament in his style, the narrative of Curtius is clear and connected, neither encumbered with extraneous matter nor interrupted by digressions. Arrian himself does not keep closer to his subject than the Roman historian of Alexander.

The editions of Curtius are very numerous. The earliest are those of Rome, 1470, and of Venice, 1470 or 1471. The edition of Pitiscus, Hague, 1708, 8vo., contains the supplement of Freinshemius and a copious commentary. The translations are almost as numerous as the editions: there are translations into Italian, Spanish, French, German, English, and other modern languages. The first English translation was by Brende, London, 1553, 1561, 1584, 1592, 1614, 4to., 1570, 8vo., and the latest by Digby, London, 1714, 1726, 2 vols. 12mo., revised by Young in 1747.

QUINTUS CLAUDIUS, QUADRIGA'RIUS, a Roman historian of the time of Sulla, wrote the 'Annals of Rome,' of which only a few fragments remain, down to the 23rd book, in the shape of quotations found in Aulus Gelpus, Nonius, Priscianus, and other ancient writers. These fragments were collected and inserted by Antonius Augustinus, bishop of Tarragona, in his 'Fragmenta Historicorum,' Antwerp, 1595. Quintus Claudius was one of the authors whom Livy had before him in compiling his history, and Livy quotes him in his eighth book (chap. 19).

QUIRITES. [Rome.]

QUISQUALIS, a genus of plants of the natural family of Combretaceae, which is indigenous in Amboyna, Java, and the Malayan peninsula, and extends into India. The genus is characterised by having a very long slender tube of the calyx, which is 5-cleft at the mouth. Petals 5, oval, oblong, larger than the teeth of the calyx. Stamens 10, exserted, inserted into the limb of the calyx; the alternate ones shorter. Ovary ovate, oblong, 5-valved. Style filiform, slender. Drupe dry, 5-angled, 1-seeded. Shrubs with climbing branches. Leaves opposite, seldom alternate, entire, ovate. Spikes axillary and terminal. Flowers change in colour from white to red. The few plants of the genus are cultivated in this country with great ease in moist stove-houses in a mixture of loam and peat. *Q. Indica* is the most common species; its fruit is reckoned a vermifuge.

QUITCH. [Couch Grass.]

QUITO, the capital of the republic of Ecuador in South America, is situated in 0° 13' S. lat. and 81° 20' W. long., at an elevation of 9543 feet above the level of the sea. This great elevation, and its position near the equator, render the climate very mild all the year round, and it may be compared with our finest spring weather. The temperature of the air at noon generally varies between 60° and 65°, and that of the coldest part of the night between 52° and 56°. In a few cases the thermometer has risen to 72°, and has descended to 45°. The mean annual temperature is 59°, which corresponds to that of the month of June in London. A small portion of the town is built on level ground, and the remainder on the declivity of a hill. The plain contains the great square, which is surrounded by public buildings. The cathedral and the episcopal palace stand opposite to one another, and the other two sides are occupied by the palace of the government and the town-hall. The square itself is spacious, and has an elegant fountain in the centre. Four wide and straight streets branch off from the four angles of the square, but they are short, and extend only to the foot of the hill. The remainder of the town is built on the lower declivities, which are furrowed by numerous ravines, some of which are of considerable depth. This circumstance renders the streets very uneven and irregular. Some parts of the city are at the bottom of the ravines, while others occupy the sides and eminences. The larger streets are paved, and the others, which are not paved, are almost impassable after rain, which is very frequent. There are some smaller squares, on which the convents are built, among which that of the Franciscans is a vast edifice, which is both magnificent and beautiful. The greater part of the houses are built of bricks dried in the sun; and in order that they may suffer less from the frequent earthquakes, they are only one story high. The roofs are flat, and are covered with the leaves of the maguey (*Agave Americana*). The interior of the houses is very simple, the saloon for receiving visitors being the only one which is ornamented, and even that is rather scantily furnished. The more wealthy classes inhabit the upper part of the house, and the common people live on the ground floor. There are only three public fountains in Quito; few of the private houses are provided with fountains, and the water is generally bad. Quito is the seat of the legislature and general government of the republic of Ecuador, as well as of the provincial government of the department of Ecuador. It has a university and two colleges for the instruction of the clergy. There is a large establishment appropriated for the maintenance of orphans and poor people, which is well managed. The surrounding country is not very pleasant for want of trees, but the scenery is very grand, as eleven snow-capped summits are visible from the town. The population was estimated at 60,000 by Ulloa, about a hundred years ago. Caldas, at the beginning of this century, reduces it to 30,000. There are some manufactures of cotton, silk, and leather, and silver and gold are worked rather extensively. (Ulloa's *Voyage to South America*; and Caldas, in the appendix to Mollien's *Travels in Colombia*.)

QUO WARRANTO is a writ in the nature of a writ of right for the king, and it lies against any person or corporation that has usurped or unjustly claims any public office or other franchise or liberty, or that, having originally had a grant of one, has forfeited it by abuse or neglect. Proceedings under it are prosecuted before the judges of the Court of Queen's Bench; and the defendant is called on to show *by what warrant* (*quo warranto*), whence the name of the writ, he exercises the office, liberty, or franchise in question. The first process against him is by summons. If he fail to appear in the same term in which he is summoned, he loses his franchise. After appearance, he may disclaim any title, either to the whole or part of the franchise; or he may plead in justification, showing by what warrant he has exercised it. To this plea there may be either a demurrer or replication, and subsequent proceedings as in ordinary actions. On disclaimer judgment is immediately given for the crown. In that case, or on judgment for the crown on demurrer, or after trial, the judgment is that the franchise shall be seized into the hands of the crown, or, if the crown cannot have the franchise, that the defendant shall be ousted, that is, ejected. If the judgment be for the defendant, it is that he may enjoy the franchise, &c., saving the right of the king; and this saving applies to all titles except that on which judgment is given. The judgment is conclusive even against the crown. (2 *Inst.*, 282; Co. *Ent.*, 527, &c.)

Proceedings under a writ of quo warranto have fallen into disuse, and they have been superseded by informations in the nature of a quo warranto. These informations are adapted to attain the same ends, are applicable to the same circumstances, and are more expeditious, but the judgment under them is not conclusive against the crown. Except when exhibited by the attorney-general, they are filed by leave of the court.

The statute of the 9 *Anne*, c. 20, was passed for the purpose of regulating and expediting the proceedings under an information of quo warranto, relating to the title to corporate offices the due discharge of which affects the rights or prerogatives of the crown or the interests of the public. Although criminal in their title and form, and having for their ostensible object the punishment by fine, as well as the ejection of a party from his office, these proceedings are virtually of a civil nature; and they are now almost exclusively employed for the decision of questions relative to the exercise of corporate rights between mere individuals. Under this statute an information may, by leave of the court, be filed, in the name of the master of the crown-office, by any party desirous of prosecuting it. Such party is styled the relator. If he be in no way connected with the corporation, that is considered as a reason for refusing the application. (1 East, 46, n.) In order to obtain leave to file an information, the relator must apply by motion in *open court*, and must support his application by affidavits of all the facts upon which it is grounded. After hearing the application, the court may either grant or refuse a rule nisi. Formerly it seems to have been grantable almost as a matter of course; but that is no longer the case, and the court will never grant a rule where the alleged usurpation might be made the subject of a civil action, or where the office exercised is not one of a public character either actually or in contemplation of law affecting the rights or prerogatives of the crown. For instance, the court will not grant a rule for the purpose of inquiring into the right to exercise the office of churchwarden. (4 *T. R.*, 381.) If a rule nisi be granted, the case comes on for argument in the ordinary course. The defendant may either support his opposition by affidavits stating the facts which form the grounds of it, or confine himself to arguments arising on the case presented by the relator. Where the consequence of giving effect to the objections raised in the information would be wholly to dissolve the corporation, or facts are shown which discredit the motives of the relator, or prove that he has himself concurred in an election which he seeks to set aside, or that the same objections apply to his own title, or where there has not been a user, that is, exercise or possession of the office, the rule would probably be discharged. (1 *T. R.*, 767; 2 B. and Ald., 320, 479.) If however the facts or law of the case be doubtful, a rule will be granted. (3 Burr., 1455.) If the rule be made absolute, the defendant must plead, at latest, within the next term. (4 *T. R.*, 284.) If the plea be insufficient, the court will allow the defendant to amend at any time before trial. In other respects, the pleading is conducted on the same principles as in ordinary cases. If the defendant be found guilty, the court may give judgment of ouster as well as fine. By the statute of Anne, costs are given to the relator against the defendant, if the information be successful; to the defendant against the relator, if it wholly fail. If one material issue be found for the crown, the crown must have judgment, and the relator is entitled to costs on all the issues. (1 *T. R.*, 453.) The provisions of the statute of Anne only relate to offices analogous to those mentioned, that is, those of a corporate character. By the statute 33 Geo. III., c. 58, the defendant in a quo warranto information against a corporate officer is enabled to plead that he had exercised the office in question for six years previous to the exhibition of the information. If the fact be found to be so, the defendant is entitled to the same judgment as if a verdict had been found for him on the merits. This provision was in accordance with a rule which the courts had already laid down upon their own authority. By stat. 1 Vic., c. 78, s. 23, the time within which proceedings of quo warranto may be brought against any mayor, alderman, councillor, or burgess, is further limited to one year after either his election to office or the commencement of his disqualification. (Com., *Dig.*, tit. 'Quo Warranto;' Bl., *Com.*)

QUORRA (or NIGER), a river in Africa, the largest in that continent except the Nile. It is not yet determined which of these two rivers has the longer course, as the sources of the Bahr el Abiad, or of the principal branch of the Nile, have not yet been visited by any traveller, and a portion of the source of the Quorra has not been accurately laid down on our maps. There can hardly be a doubt however that the basin of the Quorra is more extensive than that of the Nile.

There is some difference of opinion respecting the source of the Quorra, though all travellers agree in placing it in that extensive mountain-region which, under the name of the Kong Mountains, extends from the coast of Sierra Leone (13° W. long.) to the most eastern bend of the Quorra (7° E. long.). [KONG MOUNTAINS.] Mungo Park, who first succeeded in reaching the banks of the Quorra, and who collected much information respecting its course, laid down the source of the river in 11° N. lat. and 6° W. long. Major Laing, who in 1822 visited the countries east of Sierra Leone, was informed, at the place where he was obliged to return, that he had nearly reached the source of the Quorra, and that Mount Loma, in which it originates, was in sight. He determined therefore the source of the Quorra to be in 9° 25′ N. lat. and 9° 45′ W. long. The French traveller Mollien, who visited this part of Africa in 1818, collected other information, according to which the Quorra rises in 8° 20′ N. lat. and in 9° 10′ W. long. This difference may easily be accounted for by observing that many streams rise in a mountainous country, which unite to form a great river, and that each of them may be considered as the source of such a river. As the most western of these tributaries is that of which Major Laing got information, it is properly considered the principal river. It runs near its source due north for about 70 miles, and is there called Timbio. It then turns to the north, and exchanges its name for that of Baba, and Joli-Ba (*i.e.* large river), under which name its course as far as Timbuctoo is known, the name of Quorra being only applied to the lower portion of its course. Caillié crossed the Joliba at Curuassa, about 100 miles from its source, and found that it was navigated by large canoes. It flowed in a wide valley from south-south-west to north-north-east, which was surrounded by hills from 150 to 200 feet high. The soil of the valley was fertilised by the inundations of the river. The mountains in the neighbourhood are rich in iron-ore, and contain gold.

From Curuassa to Bammakoo, a distance exceeding 200 miles, the course of the river is unknown, not having been seen by any European traveller. But that portion of it which lies between Bammakoo (13° N. lat. and 5° 20′ W. long.) and Timbuctoo (18° N. lat. and 3° 40′ W. long.) has been laid down by Mungo Park and Caillié. Mungo Park in his first journey travelled along the banks of the river from Bammakoo to Silla, a distance of about 160 miles. Between Bammakoo and Tabbec the river runs in a north-east direction, in a wide valley which produces good crops of rice, maize, and vegetables, and has good pastures; it is pretty well inhabited, and there are several towns on the banks of the river. At Tabbec the Quorra enters the plain of Súdan, and it runs to the east as far as the town of Jennee. From Tabbec to Silla, the end of his travels, Mungo Park found the country on both sides of the river extremely fertile, well cultivated, and studded with towns of considerable size and many villages. In the rainy season the country to a considerable distance from the river is inundated. The current of the river is moderate, and offers no impediments to navigation; large river boats are frequently seen, both ascending and descending. In his second journey, Mungo Park embarked at Sego, and descended the river more than a thousand miles to the town of Boussa (10° N. lat. and 4° 40′ E. long.), where his boat was wrecked, and he was killed. Thus the information which he had obtained respecting this part of the course of the river and the countries adjacent to it, was lost to the world. But Caillié has partly supplied the loss. He descended the river from Jennee to Timbuctoo, and found the banks, in some places, well cultivated and rather populous. The general course of the river was north as far as the lake of Debo, and even to some distance farther, but afterwards it turned to the north-north-east, and continued so to the town of Timbuctoo, or rather, to its port Cabra. The river-barges which navigate this part of the river are from 60 to 80 tons burden, and take the produce of the country, rice, millet, corn, honey, butter of the shea-tree, &c., to Timbuctoo and other large places. The crews consist of about 20 men; the boats use no sails. The lake of Debo, through which the Quorra flows, south of 16° N. lat., is of considerable extent; it is perhaps ten miles from south to north, but it occupies a much greater space from east to west. North of the lake, where the river flows to the north-east, cultivation is more general, and the number of villages is greater. Some of them carry on a considerable traffic with Timbuctoo. In approaching Timbuctoo the river separates into two branches, which appear to unite at no great distance farther down. On the smaller and more northern of these branches is Cabra, the port of Timbuctoo. From this place to the town of Yáoorie (11° 10′ N. lat.) the course of the river is not known; but as Mungo Park, when he left Sego, went as far as Boussa, which is about 70 miles farther down the river Yáoorie, it is evident that the Joliba of Timbuctoo and the Quorra of Boussa are the same river. It seems that the Quorra leaves the great plain of Súdan before it reaches the neighbourhood of Yáoorie. From that place to the mouth of the river the Quorra has been navigated by the Landers. Between Yáoorie and Rabba (9° N. lat.) the river runs nearly south, and then it makes a great bend to the east, but before it arrives at 8° N. lat. it again runs south, and by degrees inclines to the west, in which direction it reaches the sea under the name of Nun. That portion of its course which lies between Yáoorie and 7° N. lat. is only navigable during and after the rainy season; at the end of the dry season, the bed of the river is full of rocks, sand-banks, and shoals. In these parts the river runs through a mountainous country, but the valley is low, and annually inundated; it is however very fertile, and villages and cultivation are common. The mountains by which this valley is enclosed rise to a considerable elevation, and with a gentle declivity. Between 8° and 7° N. lat. the lower offsets of the mountains on both banks of the river come close up to the water, and where they recede from it the interval is not very wide. The declivities of the mountains are covered with woods. This narrow valley does not contain so large a population as the wider one farther north. Near Abbazacca (about 6° N. lat.) the river leaves the mountain-region, and enters a low alluvial plain, in which it divides, as it appears, into a great number of branches, which diverging to the east and west form a delta, which probably occupies as large an area as that of the Nile, though it would be rather premature to decide this point, as the extent of the delta of the Quorra has not yet been ascertained. It differs greatly from that of the Nile, its surface being mostly covered with swamps, and in other places with jungle. Some parts of it are covered with high forests. The more elevated tracts of the delta are cultivated, and villages occur at distances of two or three miles, but most of them are surrounded by jungle, and not visible from the river. The river is frequently more than two miles wide, but in several places it contracts to a mile and even less, especially towards its mouth. The tide is perceptible to about 100 miles from its mouth.

The whole course of the river probably exceeds 2000 miles. We do not know that any of its tributaries are of considerable size, except the Sharry or Tchadda, which joins it near 8° N. lat., and is not inferior in size to the principal river, though less deep. It has been ascended about 100 miles, but is full of rocks and sand-banks. The volume of water brought down by this river evidently shows that it must have a long course, and this, with some other facts, has induced Captain Allen to suppose that the Tchadda is the only channel by which the lake Tchad, situated in the interior of Súdan, between 12° and 15° N. lat. and 12° and 17° E. long., discharges its waters into the Quorra.

In the year 1832, Mr. Macgregor Laird, and some other gentlemen of Liverpool, formed an association for the purpose of opening a direct communication with the interior of Africa by ascending the Quorra. Two steam-boats were fitted out for the expedition, and a sailing vessel was also equipped to carry out the goods with which it was proposed to trade with the natives. The crew of the larger steam-vessel, the Quorra, including the officers, consisted of twenty-six men; and that of the Alburkah, the smaller steam-vessel, consisted of fourteen men. Richard Lander, already known by his African journeys, was engaged to take the direction of the expedition, and he had also the selection of the goods with which it was supposed that a valuable trade in indigo and other produce could be carried on. The expedition was also joined by Captain (then Lieutenant) Allen, for whom the Admiralty had requested a passage for the purpose of making a survey of the river. The expedition reached the mouth of the Quorra in safety, and the river was ascended to Rabba in 9° N. lat.; the Tchadda was also ascended to Dagbeh, in 8° N. lat., a distance of above 100 miles from its confluence with the Quorra. The results of the expedition were most disastrous. It was indeed shown that the Quorra is navigable in moderate-sized vessels from the sea to Boussa; but as a commercial speculation the expedition entirely failed, and it was attended with a melancholy loss of life caused by the climate. The only survivors of the Alburkah were Mr. Oldfield, the surgeon, and three others: the survivors of the Quorra were Lieut. Allen, Mr. Macgregor Laird, and three others. Hill, the captain of the Alburkah, and Harries, the captain of the Quorra, were among the victims. Dr. Thomas Briggs, the physician to the Quorra, also died. He was the eldest son of Dr. Briggs of Liverpool. Though only twenty-eight years old at the time of his death, his acquirements were such as to give promise of the highest excellence. His clear and penetrating understanding enabled him to master any subject to which he applied; and his virtues secured the respect and love of all who knew him.

On the 26th of December, 1839, the Colonial Secretary, Lord John Russell, addressed a letter to the Lords of the Treasury, in which he stated that the average number of slaves introduced from Africa into foreign states or colonies in America or the West Indies probably exceeds 100,000 annually, and that the most likely means of effectually abolishing the foreign slave-trade would be to arrest it at its source by the establishment of new commercial relations with those African chiefs or powers within whose dominions the internal slave-trade of Africa is carried on, and the external slave-trade supplied with its victims. Of those chiefs the most considerable rule over the countries adjacent to the Niger and its tributary streams. It was therefore proposed by her Majesty's ministers to dispatch an expedition which would ascend that river by steam-boats; and they requested the sanction of the Lords of the Treasury for the estimated amount of expense which would be required for the fitting-out and maintenance of the expedition; to which the assent of the Lords of the Treasury was given on the 30th December, 1839.

A good deal of opposition has been made to this expedition by some of the merchants of Liverpool who are engaged in trading up the Niger, and one of them, Mr. Jamieson, has published 'Grounds of Appeal against the Niger Expedition,' in which he contends that the slave-trade has almost entirely ceased on that part of the African coast, that private enterprise is rapidly extending our commerce up the Niger, and that the interference of government will immediately put a stop to that commerce, 'since no private merchant can keep his ground in or near a government merchant-settlement bolstered and sustained by the public purse.'

Government however has resolved to persevere in making commercial treaties, in opening the way for all private traders, and in examining the geography of that part of central Africa. We are indebted to Captain Washington, R.N., for the following communication respecting the expedition, which will probably have sailed before the end of this year (1840). It is composed of three iron steam-vessels, of small draft of water, fitted for river navigation. After touching at the ports of Sierra Leone, Cape Coast Castle, &c., they will proceed up one of the many outlets of the Quorra, for about 300 miles, to the confluence of the Tchadda. This will probably be made their head-quarters, and the commissioners will use their utmost endeavours to form treaties for lawful traffic and for the extinction of slavery with all the native chiefs. Should opportunity be afforded, the vessels will explore the upper part of the Quorra, towards Rabba and Boussa, and also the Tchadda, as far as water-communication will admit of it; thus pioneering the way and opening the high road to the lawful merchant, to the man of science, and the missionary.

Journ.,* vol. viii.; and Laird and Oldfield's *Narrative of an Expedition into the Interior of Africa,* &c.)

QUORUM. [SESSIONS.]

QUOTIENT, or **QUOTE,** the result of dividing one number by another

INDEX TO THE LETTER Q.

VOLUME XIX.

R.

R is one of the vibrating letters called liquids. It is formed at the back of the palate, and is on this account more nearly related to the liquid *l* than to *n* or *m*. For the various forms of the alphabetical symbol see ALPHABET. It is convertible

1, with *l*. See that letter.
2, with *n*. See that letter.
3, with *rn* at the end of words. See N.
4, with *s*. See S.

5. It is apt to place itself at one time before, at another after a vowel. Thus in Greek *κροκοδειλος* or *κορκοδειλος*, *κρατος* or *καρτος*. So the English words *red*, *run*, are changed in the Dorsetshire dialect to *hird*, *hirn*. Again, *brid* is an old orthography of *bird*, and the town *Bridlington* is pronounced *Burlington*.

6. The letter *r*, in the neighbourhood of several consonants, is apt to disappear from words. Thus the German *sprech-en* is in English *speak*, our word *world* is in German *welt*.

7. In one language a word is found with an initial *r*, when in other allied languages there occur at the beginning two consonants, as *br*, *fr*, *wr*. Thus in Greek we have *ροδον*, *ρηγνυμι*, *ρεζω*, connected with which are the forms *βροδον*, *frango*, Latin, and *break*, English; and, thirdly, the English words *wreak*, *work*, *wrought*.

8. The letter *r* is at times confounded with *w*. Thus it is not a very rare variety of articulation that *rubbish* is pronounced *wubbish*.

9. More particularly when a word ends in a *w*, or even a vowel, it is not uncommon to pronounce an *r*, especially if the next word begins with a vowel. The London vulgarism, *winder*, *piller*, for *window*, *pillow*, is an example, nor need the philologist be ashamed to treat of such cases, which are as worthy of consideration as any dialect of the Greek tongue.

RAAB (in Hungarian, Györ, or Nagy Györ) is the capital of the county of the same name in the circle beyond the Danube. It is situated in 47° 41′ N. lat. and 11° 6′ E. long., in an extensive marshy plain, where the rivers Raab and Rabnieza fall into the Danube, and it is nearly surrounded by those three rivers. At a distance the steeples of its numerous churches give it a striking appearance. The streets are pretty regular and well-paved, and there are many handsome houses. Raab is divided into what is called the inner town or fortress, which has three gates, and the extensive suburbs. There are eight Roman Catholic churches, of which the most remarkable are the church of the Benedictines, formerly belonging to the Jesuits, and the cathedral, with a splendid choir and marble altars. There are also a Lutheran and a Greek church, a convent of Carmelite monks, and another of Ursuline nuns. Of the secular buildings, the chief are the bishop's palace, the county-hall, the town-hall, the royal academy, the episcopal seminary, the salt-office, the palaces of Count Esterhazy and Count Zichy; besides the seminary, and the academy, which has two faculties, jurisprudence and philosophy, ten professors and between 300 and 400 students, there are a gymnasium, a theological college, a lyceum, a Lutheran gymnasium, and several schools. There are likewise an indifferent theatre, assembly-rooms, an arsenal, two barracks, and two large poorhouses. Raab is the see of a Roman Catholic bishop and chapter, and the seat of government of the county.

Raab was a place of strength in the time of the Romans. Subsequently a people, whose name is not known, settled on the spot where the Romans had their winter-quarters. Their numbers having considerably increased, they were invited, in 1271, by king Stephen V., to live in the fortress of Raab, which he had erected, promising them considerable privileges. In 1593 the fortress fell into the hands of the Turks, through the treachery of the governor. It was retaken by the Austrians in 1598, on Easter Monday, on which day this event is commemorated with great pomp. In the year 1783, the emperor Joseph II. ordered the fortress to be totally dismantled, but in 1809 the emperor Francis ordered it to be again fortified. On the 14th of June in that year the French, having defeated the Hungarians, under the archduke John, near the town, laid siege to it, and became masters of it on the 24th, by capitulation. In 1820 orders were given again to level the fortifications, in doing which many gold, silver, and brass coins of Vespasian were found. Raab has nearly 18,000 inhabitants, of whom 5000 live in the inner town. The site of the old ramparts has been partly converted into public walks and partly used for new and handsome streets. The manufactures of woollen cloth, cutlery, and vinegar are considerable. The culture of silk is every year extending. Three much frequented annual fairs are held, and the town carries on a very brisk trade, which is much favoured by its situation on the navigable Danube, and on the high road between Vienna and Ofen.

RABATT. [MAROCCO.]

RABBI (*ῥαββί*, רַבִּי), a title of respect, similar in meaning to our word master or teacher, which was given to the teachers of the Jewish law by their disciples and the people in the time of Christ. (*Matt.*, xxiii. 7.) The title was often given to Christ by his disciples. (*Matt.*, xxvi. 25, 49; *Mark*, ix. 5; xi. 21; *John*, i. 38; iv. 31.) It is doubtful when it was first introduced. It is admitted by Jewish writers that it was not in use before the time of Hillel of Babylon, who lived in the first century before the Christian æra; and it was perhaps first introduced into the Jewish schools about the time of Christ. The word was originally used in three forms: *Rab* (רַב), as the lowest degree of honour, *Rabbi* (רַבִּי), of higher dignity; and *Rabbun* (רַבּן), or *Rabboni* (*ῥαββονί*), which was the most honourable of all. The title of rabboni is given to Christ on two occasions in the evangelists. (*Mark*, x. 51; *John*, xx. 16.)

The title of rabbi has continued in use among the Jews in modern times. The term rabbinical has been given to all the Jewish writings composed after the Christian æra. Some account of the most important of these works is given under HEBREW LANGUAGE, p. 92.

(Buxtorf, *Lexic. Chald. Rab. Talmud.*, 2176; Lightfoot, *Hor. Hebr. ad Math.*, xxiii. 7; Hill, *De Hebraeor. Rabbinis*, Jen., 1741; Winer, *Biblisches Realwörterbuch*, art. 'Rabbi.')

RABBIT. [LEPORIDÆ.]

RABDOLOGY. [NAPIER'S BONES.]

RABELAIS, FRANÇOIS, born in 1483, at Chinon in Touraine, of humble parents, entered the order of St. Francis, but his jovial temper and satirical humour made him obnoxious to his brother monks, and he was glad to obtain permission to remove into a convent of Benedictines. But here also he could not sympathise with the habits of his brethren, and at last he ran away from his convent, and went to Montpelier, where he studied medicine and took his doctor's degree. He practised as a physician, though he retained the garb of a secular priest· in his capacity of physician he became known at the court of Francis I. In 1536 he accompanied Cardinal du Belloi to Rome, and obtained the pope's absolution for the breach of his monastic vows. On his return to France he obtained a prebend in a collegiate church, and was afterwards appointed curé or rector of Meudon, in which situation he continued till his death in 1553.

Rabelais was a man of extensive and varied information; he was acquainted with the principal European languages, besides Latin and Greek, but his principal merit consists in the acuteness with which he caught at and exposed the absurdities and the vices of his contemporaries, sheltered as they were by hallowed prejudice or by the cloak of superstition and hypocrisy. His principal work is a satirical novel, in which, under an allegorical veil, he lashes all classes of society, kings, statesmen, scholars, clerical as well as lay, prelates and popes, and especially monks, of whom he seems to have had a special dislike. Rabelais took for his first hero Gargantua, a gigantic personage, about whom there were many wonderful traditional stories, to which

Rabelais added many more. Gargantua lived for several centuries, and at last begot a son, Pantagruel, who is as wonderful as himself; beneath his tongue a whole army takes shelter from rain; in his mouth and throat are cities which contain an immense population, &c. The adventures of these personages are all extravagant, and are described in humorous language, which often descends to low buffoonery and frequently to obscenity, according to the taste of the age. But under this coarse covering there lies a moral, for Rabelais meant to correct and improve society by his satire. He exposes the faults of the education of his time, the barbarous eloquence of college pedants, the folly of scholastic disputation, and the pretensions of self-styled philosophers; all which are successively held up to ridicule in the harangue of Janotus de Bragmardo, in which he demands back the bells of the cathedral of Notre Dame, which Gargantua had detached from the belfry and appended to the neck of his mare; in the curious catalogue of the books of the library of St. Victor; in the disputation carried on by signs between Panurge and the English Thaumaste; and, lastly, in the description of the prodigies which science had produced in the country of Quinte Essence, or Kingdom of Entéléchie. In another part of his work the author exposes the manners of courts and the weakness even of good monarchs. Pantagruel is a virtuous prince, devout, and severe in his morals, and yet he takes for his favourite Panurge, an arrant rogue, a drunkard, a coward, and a libertine, who seems to be a counterpart of the Margutte of Pulci's 'Morgante Maggiore,' for Rabelais was acquainted with the Italian romance-writers, whose tales of giants and heroes and their wonderful achievements he probably had in view in his narratives. The disastrous wars of Charles VIII. and Francis I. had produced too many evils in his time not to attract Rabelais' censure. To the headlong ambition of those conquerors he opposes the prudence and moderation of his heroes, who, before they enter upon even a defensive war, exhaust every means of conciliation. Two of the rash provokers of the conflict are overthrown; one is dethroned, and nobody knows what becomes of him; the other is transformed into a crier of mustard, and the circumstances which lead him to this change of condition are no less boldly imagined and described than the metamorphosis itself.

Rabelais sneers openly at the pretensions of the popes to interfere in temporal matters, and in his fourth book he exposes the pretended mortifications of a certain class of devotees who feasted on meagre days on a variety of dishes of the finest fish and other savoury things: 'Comment ès jours maigres entrelardés à leur dieu sacrifiaient les gastrolatres.'

It has been assumed by some that Rabelais' work is a continued allegory of the events and personages of his time; and people have fancied that they recognised Francis I. in Gargantua, Henry II. in Pantagruel, Louis XII. in Grand Gousier, &c. This however seems very doubtful, and the notion has been strongly combated by Ch. Nodier, in an article, 'De quelques livres satiriques et de leur clef,' Paris, 1834. It seems more likely that Rabelais made occasional allusions to some of the leading characters of his age and their prevailing faults, while he lashed in general the vices and follies of society. With regard to the traditional stories of Gargantua, which he took for his subject, see 'Notice de deux anciens Romans, intitulés les Chroniques de Gargantua, où l'on examine les rapports qui existent entre ces deux ouvrages et le Gargantua de Rabelais, et si la première de ces Chroniques n'est pas aussi de l'auteur de Pantagruel,' by J. Ch. Brunet, author of the 'Nouvelles Recherches Bibliographiques,' Paris, 1834.

The romance of Rabelais has gone through several editions and has been translated into German and English. One of the best French editions is that by Duchat, 'Œuvres de Maître François Rabelais, avec des remarques historiques et critiques,' 3 vols. 4to., Amsterdam, 1741. It is accompanied by notes explanatory of the old French words used by Rabelais, which are now obsolete. It also contains Rabelais' letters from Italy, which were published separately by M. de Sainte-Marthe, Bruxelles, 1710, with curious historical remarks by the editor. A new and improved French edition of the works of Rabelais was lately published by E. Johanneau and Esmangart, with a biography of the author, and his 'Songes drolatiques,' being a collection of one hundred and twenty caricatures, designed by Rabelais himself, and intended to represent the characters of his romance, and also his 'Sciomachie,' a work which had become extremely scarce. Swift, in his 'Gulliver's Travels,' has imitated Rabelais. Rabelais was charged in his lifetime with irreligion and heresy, but he was protected by Francis I., who, having read his romance, said that he found no grounds for the charge. In the conversation between Epistemon and Friar John, Rabelais expresses in a striking manner the terror produced in those times by an accusation of heresy. Rabelais knew Calvin, who at one time thought of numbering him among his followers, but there was too much dissimilarity between the two men to allow any such connection, and Calvin having gravely censured Rabelais for his profane jesting, the satirist took his revenge by placing in the mouth of Panurge, while buying a sheep of Dindenault, some of the theological expressions of his austere monitor.

RABENER, GOTTLIEB WILHELM, born in 1714, at Wachau near Leipzig, was educated in the public school at Meissen. In 1734 he went to the university of Leipzig to study the law, where he became acquainted with some of the most eminent men of the age, and formed an intimate friendship with Gellert, with whom he took an active part in the establishment of a celebrated literary periodical called 'Bremer Beiträge.' In 1741 he received an office in the board of taxes for the circle of Dresden, and in 1763 he was appointed counsellor of the court of aids (Steuerrath), which office he held until his death, on the 25th of March, 1771.

Rabener was, in his time, one of the most popular writers in Germany, and he exercised a very beneficial influence upon his countrymen. His satires, in which he attacked the most glaring follies, fashions, and pretensions of his time, though not marked by much depth of thought, are still instructive and amusing as historical pictures of the age in which he lived, for the things which he ridiculed have long ceased to exist. His attacks were not directed against vice, but against follies and absurdities, especially those of the middle classes; his satires therefore are not characterised by indignation or bitterness, but by a good-natured and amiable humour, his object being to improve his countrymen by ridiculing some of their absurd habits. His satires show great power of observation and a cheerful disposition combined with a considerable share of wit; the style is easy and attractive, though sometimes rather prolix. With the exception of one, they are written in prose, and were first published in several periodicals. The first collection of them appeared in 1751, at Leipzig, in 2 vols.; the year after, another, and in 1755 a fourth volume was added. A complete edition, with a Life of the author, was published in 1777, in 6 vols.

RACAMI'NÆ. [VULTURIDÆ.]

RACCOON. [URSIDÆ.]

RACE. [MAN.]

RACE-HORSE. [HORSE.]

RACE'MIC ACID—*Paratartaric Acid.* The composition of this acid is similar to that of tartaric acid [TARTARIC ACID]; they are consequently isomeric bodies; they are associated in the grape of the Upper Rhine, the racemic acid probably existing as a biracemate of potash, which, during the process of fermentation, subsides with the bitartrate of potash.

Racemic acid is prepared by saturating the tartar of the above-named district with carbonate of soda, separating the tartarate of potash and soda, which crystallizes, from the racemate, which does not; to the residual solution a salt of lead or lime is added, and, the precipitate formed being decomposed by dilute sulphuric acid, a solution of racemic acid is obtained, which by evaporation yields crystals.

The crystal of racemic acid, like that of the tartaric, is an oblique rhombic prism, and their saturating power, as well as their composition, are similar; there is also a close analogy in their general chemical relations; each forms insoluble salts with the same bases, as with lime, barytes, and oxide of lead. Biracemate, like the bitartrate of potash, is also a salt of sparing solubility; with oxide of antimony biracemate of potash forms a salt analogous to the emetic tartar which the same oxide yields with bitartrate of potash; their crystalline form is however different. The chief differences between these acids are—the less solubility of the racemic; its containing in its crystallized state two equivalents instead of one of water, one of which it loses at 212°, and the other by combining with alkalis; it does not, like tartaric acid, form a double salt with potash and soda, and the racemate is a less soluble salt than the tartrate of lime.

Racemic acid is composed of

Two equivalents of hydrogen	.	2
Four equivalents of carbon	.	24
Five equivalents of oxygen	.	40
		—
Equivalent	.	66

The crystals are composed of

One equivalent of anhydrous acid		66
Two equivalents of water	. .	18
		—
Equivalent	.	84

RACHI'TIS. [RICKETS.]

RACINE, JEAN, born towards the end of 1639, at Ferté Milon, was the son of an officer of the Excise. He lost both his parents while he was a child. He studied first at Beauvais, and afterwards in the celebrated school of Port Royal des Champs, under Lemaistre, Lancelot, and the Abbé Hanon. He applied himself especially to the study of the Greek poets. After three years spent at Port Royal, he went to finish his education at Paris, in the Collège d'Harcourt, in 1658. He had long shown a decided inclination for poetry; and on the occasion of the marriage of Louis XIV., in 1660, he entered the lists with various other poets who wrote in honour of that event; and his composition, 'La Nymphe de la Seine,' was considered as the best of the whole. It was noticed by the king, who sent to the young poet, through Colbert, a present of 100 louis-d'or. In 1664 Racine brought out his first tragedy, 'La Thebaïde, ou les Frères Ennemis,' a subject which was suggested to him by Molière. He next wrote his 'Alexandre,' which is a feeble composition. Corneille, who was then grown old, advised Racine to give up writing tragedy. Boileau, on the contrary, encouraged him; and Racine, having studied hard for some years to improve himself, produced, in 1667, his 'Andromaque,' which was acted with great applause. In the next year he wrote 'Les Plaideurs,' a humorous comedy in imitation of the 'Wasps' of Aristophanes, which was so much relished by Louis XIV., that he bestowed upon the author a pension, accompanied by a very flattering letter. Racine now produced in succession 'Britannicus,' 'Bérénice,' 'Bajazet,' 'Mithridate,' 'Iphigénie,' and 'Phèdre,' which last is often considered his master-piece. But when 'Phèdre' was first brought on the stage, in 1677, a rival coterie intrigued against him, and succeeded in running down the work, which so disgusted Racine, that he resolved to write no more plays. About that time he married the daughter of the treasurer of Amiens, a match which proved a happy one. Racine frequented the court, where he had a warm friend in Madame de Maintenon, and he was appointed by Louis XIV. historiographer of the kingdom, together with Boileau. Of his historical labours however only a few fragments remain. Several years after, at the entreaty of Madame de Maintenon, he wrote another drama, 'Esther,' which was acted in the house of education of St. Cyr, in 1689, and was well received. In the following year he wrote 'Athalie,' which was performed in the same place, and was afterwards published, but it was received very coldly, although it has since been acknowledged to be Racine's noblest composition. This was also Boileau's opinion at the time, who told him so, adding, that the judgment of the public would right itself in time, a prediction however which was not accomplished till long after Racine's death.

'Athalie' was the last play of Racine. He continued to visit Madame de Maintenon, to whom he used to read parts of his projected history of Louis XIV. As he came to advert to the system of administration, he could not help reflecting upon the wanton prodigality of expenditure, the enormous burthen of taxation, the disastrous wars caused by mere ambition, and the consequent distress of the country and the misery of a great part of the population. Racine was a man of honest feelings: he became animated with his subject; and Madame de Maintenon was evidently affected by his picture. She suggested to him to draw up a memoir of what he thought could be done in the way of alleviating the distress of the people. Racine complied, and delivered his memoir to Madame for her perusal. As she was reading it one day in her cabinet, Louis XIV. entered, and she could not conceal from him the paper nor the author of it. Louis, having glanced at the memoir, observed with a frown, that 'as M. Racine could make excellent verses, he fancied that he knew everything; as if, because he was a great poet, he ought to be also a minister of state. Racine was informed of this, and from that time he was banished from the court. He had been for some years in a declining state of health, under the influence of mental excitement and of melancholy; and the mortification which he now felt, embittered his sufferings. His complaint, which was an abscess in the liver, was badly treated by the physicians, and he sank rapidly. Louis XIV., being informed of his danger, showed great interest in his fate, and sent to inquire after him: indeed the whole court sympathised with the dying poet. At last an operation was performed; but three days after, Racine expired, in the midst of acute pain, on the 21st April, 1697, in his 59th year. He was interred, according to his request, in the abbey of Port Royal des Champs, a spot for which he had always retained a great affection. After the destruction of that monastery, in 1709, the remains of Racine were transferred to Paris, and deposited in the church of St. Etienne du Mont, by the side of those of Pascal. Louis XIV. bestowed upon his widow a pension of 2000 livres, and the reversion of it on her sons till the death of the youngest.

The plays of Racine have gone through many editions; one of the best is that of 1768, 'Œuvres de Jean Racine, avec des Commentaires par Luneau de Boisjermain,' 6 vols. 8vo. It also contains his 'History of Port Royal,' the 'Fragmens Historiques,' several discourses delivered in the French Academy, of which he was a member, and other small compositions, with a biography of Racine.

His son Louis Racine published memoirs of his father's life, two volumes of commentaries on his plays, and a poem, 'La Religion,' in six cantos.

The peculiar merits and deficiencies of Racine's plays are noticed under 'French Drama,' in the article ENGLISH DRAMA. He adhered strictly to what are called the classical unities, and his subjects were chiefly taken from antient history; but his personages, though Greek or Roman by name, are French in their character. His great merit lay in his delineation of the passions, his exquisite pathos, and the harmony of his verse.

RACK. [ARRACK.]

RACK. [TORTURE.]

RADACK and RALICK, are two chains or groups of coral islands, situated in the Pacific between 5° 30′ and 12° N. lat., and between 167° and 173° E. long. The chains extend nearly due north and south, and are not much more than 100 miles from one another. Radack, which is the eastern, consists of twelve groups of small islands, enclosed and connected with one another by coral reefs rising several feet above the sea-level. The sea which separates the single groups is of great depth. The chain of the Ralick islands is less known, and is said to consist of nine groups and three single islands. The islands themselves are of small extent, and in general situated on the windward or eastern side of the lagoons formed by the extensive coral reefs; most of them are on the reefs themselves. They are low, but well wooded. The bread-fruit tree and the pandanus are most numerous; there are also a few cocoa-nut trees. The inhabitants seem to belong to the Malay race, but they differ entirely in language, so far as is known, from the inhabitants of the other islands of the Pacific. They seem to be distinguished by great good-nature and simplicity. They have made some progress in civilization, as they mostly live on the produce of their orchards, and have commodiously built houses. Their larger boats are more than 30 feet long, and the sails are made of finely braided mats, and managed with considerable art. Though some islands belonging to this group may have been seen before, they were discovered in 1816, by Otto von Kotzebue, and some of them were more closely examined.

(Kotzebue's *First Voyage of Discovery into the South Sea and Behring's Straits.*)

RADCLIFFE, JOHN, M.D., was born of an 'antient and respectable family' (Ingram's *Memorials of Oxford*, No. [illegible], at Wakefield in Yorkshire, in the year 1650, and having acquired a competent knowledge of the learned languages at the grammar-school of his native town, was admitted a member of University College, Oxford, at the age of fifteen. He took his degree of B.A. in 1691, and became senior scholar of his college, but, as no fellowship became vacant there, he removed to Lincoln College, of which he had been previously invited to become a fellow. He took his degree of M.A. 1672, and commenced the study of physic, which he pursued in no other medical school, but attended the different courses of anatomy, chemistry, and botany delivered in the University. He is represented by his biographers as having 'recommended himself more by ready wit and vivacity than by any extraordinary acquisitions in learning,' and his books were so few in number, that, being visited in his rooms by Dr. Bathurst, the president of Trinity College, and asked by him where was his library, he pointed to a few vials, a skeleton, and an herbal in one corner of his room, and exclaimed with emphasis, 'There, sir, is Radcliffe's library.' In 1675 he took his degree of M.B., and began to practise as a physician in Oxford, where by some happy cures he soon acquired a great reputation. In 1677 he relinquished his fellowship in accordance with the statutes of the college, which require all the fellows after a certain time to enter into holy orders. He wished however to keep his rooms in college, and to reside there as a commoner, but this Dr. Marshall, the Rector (who is supposed to have been offended at some witticisms pointed at him by Radcliffe), refused to allow, which so much disgusted him that in after life he lavished the whole of his munificence on his former college, University, leaving to Lincoln only the second presentation to a living if no fellow of University chose to accept it.* In 1682 he took the degree of M.D., and went out a Grand Compounder; an important ceremony in those times, and for a century afterwards, being accompanied with much expensive pomp and solemnity; all the members of the college walking in procession with the candidate, himself bare-headed, to the Convocation House. At length, in 1684, he removed to the metropolis, and settled in Bow Street, Covent Garden, where in less than a year he got into great practice, to which perhaps his pleasantry and ready wit contributed as much as his reputed skill in his profession. He was now in the high road to wealth and reputation, but it would be tedious and useless to trace all the steps of a man destitute of all the ornaments of a liberal profession, and who, as Richardson relates, once said to Dr. Mead, 'I love you, and now I will tell you a sure secret to make your fortune; *use all mankind ill*;'—by which he meant, to regard his interests and his humour as superior to all considerations of duty or propriety. There is reason however to suppose that he owned as a vigorous and decisive method of practice, which distinguished him from the mere practitioners of the day; and it is no small praise to have obtained Dr. Mead's testimony, that 'he was deservedly at the head of his profession, on account of his great medical penetration and experience.'

In 1686 he was appointed by the princess Anne her principal physician, and from this time till his death he enjoyed the undisputed favour of the court, during the reigns of William and Anne; and although he often offended both the king and queen by his freedoms, yet such was the opinion of his medical skill, that he was always sent for in any case of danger. There are few events in his life that require particular notice, and the greater part of his biographers have only given a collection of anecdotes showing at once his wonderful skill in forming a correct prognosis, his rudeness and brutality towards his patients even of the highest rank, and the enormous sums of money which he received as fees. The reader will find abundance of these anecdotes in 'The Gold-Headed Cane,' 'The Georgian Era,' 'Lives of British Physicians,' in the *Family Library*; Ingram's 'Memorials of Oxford,' &c. Towards the end of the reign of James, the then-celebrated Master of University College, Obadiah Walker, his fellow-collegian, was in vain employed to influence his religious principles. The answer of Radcliffe was firm and dignified: that 'being bred up a Protestant at Wakefield, and having continued such at Oxford, where he had no relish for absurdities, he saw no reason to change his principles and turn Papist in London.' In 1693 he entered upon a treaty of marriage with the only daughter of a wealthy citizen, and was near bringing the affair to a conclusion, when it was discovered that the young lady had an intrigue with her father's bookkeeper, which disappointment had such an effect upon him, that he determined to continue in celibacy. In 1713 he was elected into parliament for the town of Buckingham, but only two of his speeches have been preserved, and it does not appear that he was at all distinguished as a senator. He was sent for to attend Queen Anne when she lay at the point of death, but, being much indisposed himself, and knowing the case to be desperate, he declined coming, for which he was much blamed at the time, and intimation was given him that the populace in London were disposed to tear him in pieces if he should venture to come to town from his country-house. It is probable that the agitation of his mind concurred with a broken constitution in bringing him to an end two months afterwards, November 1, 1714, at the age of sixty-four. His body lay in state at his house at Carshalton, where he died, till November 27; it was then removed to an undertaker's in the Strand, and thence conveyed to his favourite city Oxford, where it was interred with great solemnity in St. Mary's church, near the north-west corner of the present organ-gallery, with the following simple inscription engraved on a brass plate on his coffin: 'John Radcliffe, Dr. in Physick, dyed Nov. ye 1st, 1714, in the 65th year of his age.'

In Radcliffe's character there really seems to be very little to admire. His refusing to embrace Romanism gives him but a slight claim to be considered a pious man, when all the rest of his conduct showed his carelessness and indifference to religion. He indulged in the pleasures of the table to excess, and is supposed to have shortened his days by his intemperance. There are upon record a few noble instances of his liberality during his lifetime, but not so many as might have been expected from his immense wealth. Richardson says 'he owned he was avaricious, even to spunging, whenever he anyway could, at a tavern reckoning, a sixpence or shilling, among the rest of the company, under pretence of "hating (as he ever did) to change a guinea, because (said he) it slips away so fast." He could never be brought to pay bills without much following and importunity; nor then, if there appeared any chance of wearying them out.'

It only remains to give some account of his posthumous benefactions, which were indeed most munificent, and which well entitle him to hold a place in the long list of benefactors to the University of Oxford. After making a life provision for some of his relations, he bequeathed his whole fortune to public uses. To St. Bartholomew's Hospital in London he gave for ever the yearly sum of 500*l.* towards mending their diet, and the further yearly sum of 100*l.* for buying of linen. He left 40,000*l.* for the building of a library at Oxford, which he endowed with an annual stipend of 150*l.* for the librarian (who is chosen by the same electors that appoint the travelling fellows, to be hereafter mentioned); 100*l.* per annum for repairs, and 100*l.* per annum for the purchase of books. A description of this building is given under OXFORD [vol. xvii., p. 98]. It was at first called 'The Physic Library,' being intended chiefly for books and manuscripts relating to the science of physic; comprehending, as that term was then understood, anatomy, botany, surgery, and natural philosophy. Accordingly, in compliance with a resolution of the trustees, the purchase of books is still entirely confined to works connected with natural history and medicine, and it may be added that the very small sum destined by Radcliffe for the buying of books is often exceeded. The foundation stone was laid with great ceremony, May 17, 1737; and, being completed in about ten years, it was at length opened in a most solemn manner, on Thursday, April 13, 1749; when the Duke of Beaufort, in behalf of himself and the other trustees, formally delivered the key to the vice-chancellor 'for the use of the University.' The first librarian was the Rev. Francis Wise, B.D. of Trinity College; the present one is John Kidd, M.D. of Christ Church, Regius Professor of Medicine. To University College he left 5000*l.* to build the master's lodge there, making one side of the eastern quadrangle. He also left them his Yorkshire estate in trust for the foundation of two Travelling Fellowships to be held by 'two persons to be chosen out of the University of Oxford, when they are M.A., and entered on the Physic line.' The electors are, the Archbishop of Canterbury, the Lord Chancellor, the Chancellor of the University, the bishops of London and Winchester, the two principal secretaries of state, the two chief justices of the Queen's Bench and Common Pleas, and the Master of the Rolls. The appointment is 300*l.* per annum to each of the fellows, and apartments in University College. They hold their fellowships 'for the space of ten years, and no longer, the [first] half of which time, at least, they are to travel in parts beyond sea for their better improvement.'* He also bequeathed

* A different account is given by the Life of Radcliffe, prefixed to his works, from which it appears that Radcliffe was offended because a friend of his [illegible] College, [illegible] to fill up his place at Lincoln.

* They are at present required to 'pass the first five years beyond sea,' [illegible] the Travelling

the perpetual advowson of the rectory of Headbourne Worthy, in Hampshire, to trustees for the benefit of University College for ever, so that a member of that society should always be presented to it on every vacancy. He gave to the same college during his life 1100*l.* for increasing their exhibitions and for general repairs, and the painted window at the east end of their chapel appears to be his gift by the following inscription under it: 'D.D. Joan. Radcliffe, M.D., hujus Collegii quondam Socius, A.D. MDCLXXXVII.' After the payment of the bequests above mentioned, he gave to his executors, in trust, all his estates in Buckinghamshire, Yorkshire, Northamptonshire, and Surrey, to be applied in such charitable purposes as they all, in their discretion, should think best; but no part thereof to their own use or benefit. The first trustees were the Rt. Hon. William Bromley, principal secretary of state, Sir George Beaumont, Bart., Thomas Sclater, of Gray's Inn, Esq., and Anthony Keek, of Fleet Street, Gentleman. The present trustees are Lord Sidmouth, Sir Robert Peel, W. H. Ashurst, Esq., W. R. Cartwright, Esq., and T. G. Bucknall Estcourt, Esq. Out of these funds were built the Infirmary (1770) and the Observatory (1772) at Oxford, and the Lunatic Asylum on Heddington Hill near that city also received so much assistance from the same source (1827), that the committee gave it the name of the 'Radcliffe Asylum.' In 1825 the trustees gave 2000*l.* towards building the present College of Physicians in London, and they have ever been found ready to contribute according to their means to every charitable and useful purpose.

RADCLIFFE LIBRARY. [OXFORD.]

RADEMACKER, GERARD, was born at Amsterdam, in 1673. His father, an architect, much esteemed by Lairesse and other artists, instructed him in the first principles of drawing and perspective, and would have brought him up to his own profession, but perceiving his predilection for painting, he placed him under A. Van Goor, a respectable portrait-painter. Gerard applied himself to his studies with unremitting perseverance so long as his master lived, and at his death, being sufficiently advanced to give lessons in design, he was engaged by the bishop of Sebaste to teach his niece drawing. His agreeable manner gained the favour of the bishop, who, being soon afterwards obliged to go to Rome, invited Rademacker to accompany him; he spent three years at Rome, and greatly improved himself by indefatigable study. He was fond of representing views of the principal ruins and antient monuments, which he designed with great accuracy and spirit. On his return to Holland, his extraordinary success produced him numerous friends and abundance of employment. He did not however confine himself to architectural subjects, but painted many historical and emblematical pieces. His fertile invention and facility of execution enabled him to paint many pictures in a short time. He is reckoned one of the best masters of the Dutch school for the grandeur of his style, which had been cultivated by the study of the best models. He died at Amsterdam, in 1711.

RADEMACKER, ABRAHAM, supposed to be a younger brother of Gerard, was born at Amsterdam, 1675, and attained a high rank as a landscape painter without the assistance of a master. At first he drew in Indian ink, in which style he acquired great perfection; his early productions are in water-colours, and very highly finished; and he subsequently painted with equal success in oil-colour. His invention was extremely fertile; he composed readily and agreeably, and embellished his landscapes with picturesque ruins and buildings, and adorned them with well-designed groups of figures and animals. He engraved a set of nearly 300 plates, from his own designs, of the most interesting views of antient monuments in Holland and the Austrian Netherlands. They are executed in a masterly manner, and were published at Amsterdam in 1731. He died in 1735.

RADIATION OF HEAT is a motion of its particles in rectilinear directions, diverging every way from a heated body, either luminous or not; and it is imagined to arise from the existence of a strongly repulsive power by which the particles are made to recede from each other with great velocity.

Fellow, after living for five years in England, preferred giving up the Fellowship to fulfilling the intentions of the founder by going abroad for the remainder of the time. It may be added that Radcliffe's bequest has been of very little use to medical science, as the only one of the Travelling Fellows (as far as the writer is aware) who has distinguished himself by his scientific writings is Sir John Sibthorpe, the author of the 'Flora Græca,' and founder of the Professorship of Agricultural Botany.

The intensity of heat thus emitted from a point of radiation is obviously the same at equal distances from the point; and, at unequal distances, it is inversely proportional to the squares of the distances. The radiating particles falling upon the surfaces of any bodies in the vicinity of that from which they emanate, are, according to the nature of those bodies, absorbed in them, or transmitted through them, or again they may be reflected from them; and, in the two last cases, the radiant heat, as it is called, appears to suffer modifications analogous to those which, in like circumstances, take place in light. According to M. Prevost (*Essai sur la Calorique Rayonnante*, 1809), the radiation of heat is a process which is perpetually going on among all the bodies in nature; those which are of equal temperature mutually interchanging equal quantities of caloric; but, with respect to two bodies which are unequally heated, that which has the greatest quantity sends forth emanations in greater abundance than the other; the difference however diminishing as both bodies approach to an equality of temperature.

The particles of heat (calorific particles) appear to move with perfect freedom through a vacuum, and to be impeded, but in an insensible degree, in their progress through air or any of the gases; they are also found capable of being transmitted, though in small quantities, through transparent media of the denser kinds, as glass, rock-crystal, &c.; and in passing through air they produce no sensible effect on the temperature of the latter. If a body be heated to any degree of temperature, and be placed in an absolute vacuum, it is evident that, in consequence of the repulsive power above mentioned, the heat must at length be entirely dissipated by the radiation merely; and if the body be placed in any fluid, it may be readily concluded that the abstraction of the heat must be influenced by the conducting power of the fluid.

The first direct experiments which appear to have been made on the radiation and reflection of heat are those of Mariotte, and an account of them is given in the 'Mémoires de l'Acad.,' 1682. He caused the heat of a fire to fall on the surface of a concave mirror, and observed that it was concentrated in the focus of the latter; and, on placing a plate of glass between the fire and the mirror, he perceived that the rays of heat were intercepted. The subject does not appear to have been much attended to till about the middle of the eighteenth century, when Lambert, in his 'Photometria' (1760), states that, on placing a large glass lens before a fire, the heat was scarcely sensible at the focus, while the reflected heat of burning charcoal set fire to combustibles at a considerable distance, and Scheele (a man who without any early education made many important discoveries while serving in the laboratories of his employers, the apothecaries of Gottenburg and Stockholm), in his treatise on air and fire, which appears to have been written in 1775, describes radiant heat as differing from ordinary heat by disseminating itself in right lines whose directions are not changed by the agitations of the air, and by being reflected from polished metallic mirrors, while it is absorbed in those of glass, and in the others when their surfaces are blackened.

The experiments of Scheele were varied by MM. Saussure and Pictet, who by an appropriate apparatus endeavoured to ascertain the laws of the radiation of caloric. They employed for this purpose two concave mirrors of polished tin, in the focus of one of which was placed the bulb of a Réaumur's thermometer, and in that of the other a ball of iron heated below the degree necessary to render it luminous; and, by a comparison of the height of the mercury in the thermometer with that in one which was placed out of the focus, but at an equal distance from the iron, the difference was found to be equal to about 8 degrees. M. Pictet employed also, in place of the heated ball, a glass flask containing boiling water, in order to avoid the risk of any light being combined with the heat; and the effect produced on the thermometer sufficiently proved that the calorific rays exist independently of those of light. (Pictet, *Essai sur le Feu*, 1790.) In pursuance of the experiments of Scheele with a blackened mirror, M. Pictet covered with lampblack the bulb of the thermometer in the focus of one of his mirrors, and found that the concentrated heat from the flask, which when the bulb was bright raised the mercury $2\frac{1}{4}$ degrees, now raised it $4\frac{1}{2}$ degrees. The same experimenter placed a flask of snow in the focus of one metallic reflector, and a thermometer in that of another; and the observed fall of the mercury, was then considered as an indication that cold is susceptible of radiation and reflection like heat.

The nature of the apparatus, and the experiments made by Professor Leslie on the radiation of heat, are described in the article HEAT. From these it appeared that the amount of radiation from a polished surface was only about one-eighth of that which took place from a surface without polish; and hence it was evident that the velocity of radiation depends more on the surface than on the nature of the radiating body. In making experiments respecting the absorbing power of substances, Leslie found that when the heat from the canister was suffered to fall on the glass ball of the differential thermometer, the quantity received by the latter, if covered with tin-foil having a polish, was only one-fifth of that which it received in its ordinary state.

Professor Leslie also repeated the experiments of Pictet for determining what was called the radiation of cold; and filling his canister with ice or snow, he found that the cold apparently emitted from the varnished side was the greatest, and least from the polished side (the tin); he observed also that the cold, like the radiant heat, varied with changes in the absorbent power of the thermometer and of the surface of the mirror. The mercury in the thermometer fell more when the mirror was of polished metal than when of glass; it also fell more when the bulb was in its ordinary state than when covered with a polished tin-foil. (*Inquiry into the Nature of Heat*, 1804.) These circumstances, which seemed at one time to favour the opinion that cold had a material existence like heat, have received an explanation from M. Prevost of Geneva. (*Journal de Physique*, xxxviii.) This philosopher observes that a mass of ice or snow may send out radiant heat less in abundance than that which is emitted from other bodies in its vicinity; and this comparatively small quantity of heat, when reflected from one mirror to the other, and from the surface of the latter to the focus, may there produce the effect of *absolute cold*, by causing the thermometer to send out radiant heat to the ice, and thus render the mercury in it lower than it would otherwise be. This interchange of caloric between the thermometer and the ice may be conceived to go on, the former on the whole losing, and the latter acquiring it, till an equilibrium is established between their temperatures.

From the results of the valuable experiments made by Professor Leslie, it is apparent that the power by which bodies absorb heat is directly proportional to that by which they allow it to radiate from them; and that both are inversely as to the power of reflecting it. When the rays of heat fall on polished glass, a large portion of them is absorbed, these raise the temperature of the glass, and from the surface of the latter that heat is afterwards radiated in abundance; whereas, when the rays strike the surface of polished metal, nearly all of them are reflected. It was found however that different metals, independently of their polish, have different degrees of reflecting and radiating power. A mirror of tin being rubbed with mercury, the reflection was increased in the ratio of 12 to 20, though the degree of polish was the same; and a metal having lost some of its brilliancy by oxidation, the radiating power was proportionally augmented.

Leslie's canister was found, moreover, to produce different effects, according to the thickness of the covering material on its sides. One coat of jelly on the tin side produced an elevation of the thermometer equal to 38°, and four such coats produced an effect equal to 54°; but after a certain thickness the difference was insensible. A plate of metallic leaf rendered however the radiating power as great as a thick plate of the same metal.

Experiments made by Count Rumford, soon after the publication of Leslie's work, produced nearly the same results as the latter had obtained; and the Count draws from them several useful conclusions. He observes (*Phil. Trans.*, 1804) that when we would confine heated substances, solid or fluid, in a vessel, the surface of the latter should be highly polished; on the other hand, if the object be to cool the substances, the surface should be painted or varnished, or be covered with a soft coating which is not metallic. Also, in warming apartments by steam, the intention being to promote radiation as much as possible, the tubes conveying the steam should be unpolished or painted.

In pursuing the views of Saussure concerning the transmission of heat through screens, Leslie found that a sheet of tin interposed between the canister and the mirror entirely intercepted the heat, and a plate of glass nearly so. Employing two sheets of tin, each of which had one side covered with black varnish, while the other side was polished, the following were the results: when the varnished sides were in contact, little heat passed through, evidently because one of the exterior sides was not well adapted to receive the caloric, nor the other to radiate the little which might have been acquired; but when the varnished sides were placed externally, the quantity which passed through was considerable, the varnish enabling one plate easily to absorb and the other as easily to radiate the heat.

The reality of the transmission of heat through glass plates, which both Leslie and Dr. Brewster appeared to doubt, from the difficulty of distinguishing between heat as transmitted and that which radiates from the glass after having been for a time absorbed in it, is now supposed to be sufficiently established by the experiments of MM. Prevost and De la Roche (*Annals of Philos.*, 1803), and also by the researches of M. Melloni (*Annales de Chimie*, xlviii., &c.) The first, in order to ascertain the fact, received on a thermometer the rays from a heated body after passing through screens of glass which were renewed so often that they had not time to become heated. The second suffered a thermometer to rise to its maximum by the rays from a heated body when a transparent glass screen was interposed; and again, when there was interposed a glass screen blackened so as to prevent the radiant heat from passing, the excess of the rise of the thermometer in the former case above that in the latter gave evidently the effect produced by the radiant heat alone. The conclusion at which the experimenters arrive is, that the quantity of heat which radiates through glass is so much the greater as the temperature of the source of the heat is higher. M. Melloni found that of 100 rays incident on the same plate of glass from an oil-lamp, from red-hot platinum, from copper heated to 734°, and from the same heated to 212°, the numbers were 77, 57, 34, and 12, respectively. He has also ascertained that all bodies which have the power of transmitting heat are in general more or less transparent; and that rock-salt is the only known substance in which all the radiant heat falling on it is either reflected or transmitted, whether the temperature of the heated body be low or high.

By letting the calorific rays pass first through one screen and then through two, M. De la Roche found that, in passing through the second screen, the rays suffered less diminution of intensity than in passing through the first; and the fact is considered as proving that some calorific rays experience more difficulty in passing through glass than others: consequently that, like light, radiant heat is of different kinds. He also observed that a thick plate of glass allows a smaller quantity of radiant heat to pass through than a thin one, and that the difference is so much the less as the temperature of the heated body is higher; and it is inferred that, since radiant heat becomes more capable of penetrating glass as the temperature increases, till the body becomes luminous, heat is only a modification of light.

The theory of radiant heat is intimately connected with that of the cooling of bodies; and the first effort to determine the laws relating to this subject was made by Sir Isaac Newton, who, from theoretical considerations, inferred that when a heated body is exposed to a constant cooling cause, as the uniform action of a current of air, it ought to lose at each instant a quantity of heat proportional to the excess of its temperature above that of the surrounding air, and consequently that its losses of heat in equal intervals of time should form a decreasing geometrical progression. But it is now known that this law holds good only when the differences of temperature do not exceed 40 or 50 degrees, and its inaccuracy at high temperatures was first pointed out by Martine (1740).

From the experiments of MM. Dulong and Petit, it is found that, if it were possible to obtain the absolute loss of heat which a body in vacuo experiences (or that loss which would take place if there were no restoration of heat from surrounding bodies), the velocities of cooling, estimated by the diminutions of temperature indicated by an air thermometer, would increase in a geometrical progression when the temperature of the heated body increases in an arithmetical progression; and further, that the ratio of the former progression (= 1·0077) would be the same for all bodies, whatever might be the state of their surfaces, and whether the temperature of the vacuum remained constant or increased in an arithmetical progression. But, on taking account of the quantity of heat sent back at every instant by the surrounding medium (a quantity which will be constant if the temperature of that medium does not vary), it is found that the velocities of cooling in vacuo increase, for equal increments of temperature, in a geometrical progression whose terms are diminished by a constant quantity, which quantity varies in a geometrical progression when the temperature of the medium varies in an arithmetical progression. By direct experiments on the cooling of heated bodies in air and hydrogen gas, Dulong and Petit determined what Professor Leslie had before ascertained by an indirect process, namely, that the loss of heat when a body is in contact with a gas is independent of the surface of the cooling body. They found also, by experiments on dilated air and carbonic acid at various temperatures, that the velocity with which a body cools from the mere contact with gas (when the excess of temperature of the heated body above that of the surrounding gas is constant) depends on the density and temperature of that gas; but this dependence is such that the velocity of cooling remains the same if those elements change in such a way that the elasticity of the gas remains constant. The same chemists have also ascertained that, when the elasticity of air varies in a geometrical progression, its cooling power varies likewise in a geometrical progression, in such a manner, that when the common ratio of the first progression is 2, that of the latter is 1·366. If, instead of common air, hydrogen gas, carbonic acid, or olefiant gas be in contact with the heated body, the ratio of the first progression being as before, that of the second is 1·301. And they conclude that the cooling power of each of the last-mentioned gases is nearly proportional to the square root of the elasticity of the gas. (*Annales de Chimie*, vii.; *Annals of Philos.*, xiii.)

That the colours of bodies have some effect on the velocity of radiation and on the absorption of heat has been proved by experiments made by Dr. Stark of Edinburgh (1833). This gentleman surrounded the bulb of a thermometer successively with equal weights of black, red, and white wool, and placed it in a glass tube, which was heated to the temperature of 180° by immersion in hot water; the tube was then cooled down to 50° by immersion in cold water, and the several times of cooling were respectively 21, 26, and 27 minutes. On winding successively black, red, and white wool about the bulb, and raising the temperature from 50° to 170°, the times in which the thermometer so surrounded acquired the latter temperature were respectively 4½, 5½, and 8 minutes. (Turner's *Elements of Chemistry*, 'Heat.')

Having thus briefly noticed the reflection of radiant heat, its transmission through plates, and the laws of velocity with which bodies become cooled, we may conclude with a few words concerning its refrangibility. This subject was first examined by Dr. (afterwards Sir William) Herschel, who, having analysed by the prism, as usual, a beam of solar light, and having placed a Fahrenheit's thermometer successively within the fields of the different coloured rays in the spectrum, found that in the violet rays the temperature was 2°, and, gradually increasing towards the other extremity, in the red rays it was 7° above the general temperature of the apartment. He also ascertained that there was a point beyond the limits of the visible red rays at which the excess of temperature was a maximum. Similar observations were made about the same time by Sir Henry Englefield; and it was hence evident not only that the calorific rays were refrangible, but that the property existed in them in a higher degree than in light. Dr. Herschel afterwards made a number of observations on small pencils of heat proceeding from a lighted candle, a common fire, iron heated to redness, and also from iron heated to a lower degree; and he discovered that, in all these cases, the calorific rays were susceptible of refraction. He found however that there was some difference between the heat of the sun and that of terrestrial bodies, the former passing more freely through the glass than the latter. (*Phil. Trans.*, 1800.) M. Melloni has subsequently ascertained, by using prisms of rock-salt (a mineral which possesses in a high degree the power of transmitting heat), that heat from different sources, like light of different colours, has different degrees of refrangibility.

It ought to be observed that M. Berard, in a memoir on the physical properties of solar light, states that he found the point of greatest heat to be not beyond but within the red rays of the spectrum. But Sir David Brewster relates that Sir Humphry Davy discovered the cause of this difference, which is ascribed to the nature of the thermometer employed by the French chemist. On using slender thermometers with long bulbs, and filled with air which was confined by a coloured fluid, Sir Humphry Davy obtained results which confirm the observations of Dr. Herschel and Sir Henry Englefield.

M. Berard ascertained that when light suffers double refraction in Iceland spar, the two pencils formed spectra which exhibited similar properties; in both, the calorific power differed at the two ends, and existed beyond the visible red rays. Also, on polarising by reflection from glass a beam of solar light, and receiving the reflected ray on a second glass, the latter being capable of turning round till the ray ceased to be reflected from it, he found that while the light was reflected, the heat was also reflected, and that when no light was reflected, there was no heat. The like effect was produced when, instead of a pencil of solar light, a portion of radiant heat from a body not luminous was employed, and the inference is, that the particles of radiant heat are polarised by reflection, like those of light. This subject has however been since more completely investigated by Professor Forbes. (*Edinburgh Phil. Trans.*, 1835.)

The subject of solar radiation, or of the direct force of the sun's rays, so important to the agriculturist as well as to the philosopher, has been treated by Mr. Daniell, in his 'Meteorological Essays,' 1823; and indeed to this gentleman we are indebted for nearly all that is known respecting it. On comparing a thermometer exposed to the action of the sun with one which gave the mean temperature of the air in the shade, Mr. Daniell observed that the power of solar radiation varies with the sun's declination; the greatest intensity taking place in June, though the greatest mean temperature of the atmosphere does not occur till July. He observed also that the radiation varies at different hours of the day, increasing with the sun's altitude till a short time after it arrives on the meridian, and then diminishing till the evening. From the observations of Captain (now Major) Sabine at Sierra Leone, at Bahia, and at Port Royal, Mr. Daniell has been led to conclude that the intensity of solar radiation diminishes in proceeding towards the equator; and the conclusion appears to have been subsequently confirmed by the observations of Captains Scoresby and Parry, and of Dr. Richardson, in the Arctic regions. From the observations of Captain Sabine on the mountains of Jamaica, Mr. Daniell considers that this radiation increases from the surface of the earth upwards.

Since all bodies, even in vacuo, lose heat by radiation, it is easy to conceive that any part of the earth's surface, when not exposed to the direct action of the sun, must emit calorific rays of heat towards the heavens, and thus must become cooled. This is called *terrestrial radiation*, and the subject has been particularly considered by Mr. Daniell, who, from observations continued during all the months of the year found that the maximum depression of the thermometer, on account of radiation, varied from 10° to 17° between midwinter and midsummer: but that the mean depression was the least in January and July, and the greatest in April. It is obvious however that numerous observations are yet to be made in different regions of the earth before any general theory respecting the extent and law of the variations of solar and terrestrial radiations can be formed.

RADICAL. [Root.]

RADICO'FANI. [Siena, Province.]

RADISH. [Raphanus.]

RA'DIUS (a ray, the spoke of a wheel) means the line drawn from a point, considered as a centre or pole, to any point of a curve.

RADIUS OF CURVATURE. [Curvature; Surface.]

RADIUS. [Skeleton.]

RADIX (root) is applied to any number which is arbitrarily made the fundamental number of any system. Thus ten is the radix of the decimal system of numeration, and the radix of the common system of logarithms. The term however has not acquired much fixed use, though often convenient for temporary specification of the use which is made of a particular number or fraction.

RADNOR. [Radnorshire.]

RADNORSHIRE, a county of South Wales, lying between 52° 2′ and 52° 28′ N. lat. and 2° 57′ and 3° 45′ W. long. This county is of an irregular form, bounded on the north by Montgomeryshire and Shropshire, on the east and south-east by Herefordshire, on the south and south-west by Brecknockshire, and on the west by Cardiganshire. Its greatest length is from near Presteign, on the east, to the Cerrigyddwr Hills, on the west, a distance of 31 miles. Its greatest breadth, from the hills in the parish of Beguildy, on the north, to the river Wye, near Glasbury, on the south, 25 miles.

Presteign, the county town, is 151 miles north-west from London, measuring by the mail-coach road, and about 128 in a straight line. It is the smallest of the six counties of South Wales, having a superficial extent of 426 square miles (being 184 miles less than Pembrokeshire, the county of South Wales next in size). Its population also is inferior to the other counties of South Wales: the Parliamentary Returns for 1831 state the total number of inhabitants to be 24,651.

Surface, Hydrography, &c.—Radnorshire is decidedly a mountainous county, but it would be difficult to say in what direction the hills generally extend. The highest range however, that of Radnor Forest, has an inclination from south-east to north-west. The Carneddu Hills and Llandegley Rocks have a similar direction; but, with these exceptions, it is in vain to lay down any general rules in regard to the line and grouping of the mountains of this county. One portion of Radnor Forest, lying between New Radnor and Llanvihangel Rhydithon, attains the height of 2163 feet above the level of the sea. Another point, called Whimble, is scarcely inferior, being 2150 feet high. The points next in elevation are Fron, 1950 feet; Fron-wen, 1800; Bach Hill, 1750: all of which are portions of the wild tract of land called Radnor Forest, situate on the eastern side of the county, parts of which, from the name and other circumstances, it is natural to suppose were covered with wood, although now producing nothing but moss and heath. It is the property of the crown, who appoints a forester to protect its interests. There are some hills (for they partake more of the character of hills than mountains) of considerable height in other parts of Radnorshire. The southern end of Rhydd Hywel, on the right of the road leading from Rhayader to Llanidloes, 1750 feet; Bryn Mawr, in the parish of Llanvihangel Nantmelan, and Gwaun Ceste, in Glascwm parish, are each 1700 feet high; Gorwaddu, near Llanbadarn Fynydd, is 1680 feet; Camlo Hill, near Abbey Cwm Hir, 1656 feet; and Cefn Craig-y-Foel, near Nantgwyllt, 1550 feet.

The general direction of the rivers and streams is to the south-east; and nearly all of them empty themselves into the Wye and its tributaries. The exceptions are, the Teme, and a small stream called Afon Tylwch, which takes its rise in the north-western part of the county, and runs into the Severn at Llanidloes in Montgomeryshire.

The Wye enters Radnorshire on the north-west, between Llangerrig and Rhayader, at a distance of about eighteen miles from its source on Plynlimmon. From two miles below Rhayader to the town of Hay it forms the boundary between Radnorshire and Brecknockshire, the former county being on the north-east and the latter on the south-west side of the river. The Wye then separates Radnorshire from Herefordshire, as far as the village of Rhydspence, where it quits the former county. The Elan is the first considerable stream that adds its waters to those of the Wye. Rising on the elevated ground on the borders of Cardiganshire, it takes a circuitous but rapid course easterly towards the Wye, which it enters on the right bank a short distance below the town of Rhayader. The scenery of the Elan is extremely romantic, and is finely described by the Rev. Wm. Bowles, in his poem of 'Combe Ellen.'

The Ithon rises on the northern side of the county, adjoining Montgomeryshire, and takes a course directly south. It forms the drain for the central portion of the county; and before its junction with the Wye, on the left bank of that river, seven miles above the town of Builth, it becomes a stream of considerable size, having a course of 30 miles. The Elan and Ithon are the only two rivers which exclusively belong to Radnorshire. The Lug rises in the east portion of the county, and runs south-east to the town of Presteign, two miles below which it enters Herefordshire, and traversing the most fertile parts of that county, falls into the Wye four miles below Hereford. The source of the Teme is in the parish of Beguildy: running in a south-east direction by Knighton, it enters Herefordshire a short distance above the village of Brampton Bryan. In its course it serves as the boundary between Radnorshire and Shropshire.

The smaller streams of Radnorshire are the Somergil, Edw, Marteg, Clywedog, Arrow, and Bach-wy. The cataract called 'Water-break-its-neck' is formed by a branch of the first-named stream. The scenery on the Edw and Bach-wy, near their respective junctions with the Wye, is well worthy the traveller's attention. The Wye and Ithon abound with salmon. The fish of the other streams are principally trout and grayling.

The lakes, or pools of natural water, are neither extensive nor numerous. The largest is Llanbychllyn, situated in the hundred of Painscastle, between Llanbedr-Painscastle and Llandewi-fach. It is one mile and a half in circumference. The most picturesque is Gwyn Llyn, about two miles west of Rhayader, on the old road to Aberystwith. There is a third pool, called Llyn-hilun, close to the turnpike-road leading from New Radnor to Builth. It is about a mile in circumference, and at a very considerable height above the adjoining valley.

The roads of this, like those of most other counties, have been considerably improved of late years. The improvements effected in Radnorshire are owing in some degree to the flourishing state of Aberystwith in Cardiganshire, and the estimation in which that town is held as a watering-place and fashionable summer resort, the main roads of this county forming a communication between Cheltenham, Worcester, Birmingham, &c. and the Cardiganshire coast. The road from Birmingham and Worcester to Aberystwith enters Radnorshire at Presteign. From that town there are two branches, the one through New Radnor and Llandegley, and the other, a line lately formed through the valley of the Lug, and uniting with the former at Penybont, on the western side of Radnor Forest: from thence the road runs through Rhayader and along the banks of the Wye, quitting Radnorshire at the distance of eight miles from the last-mentioned town. The Cheltenham and Hereford road enters the county at Stanner, and unites with the line just described, between Kington (Herefordshire) and New Radnor. The Cheltenham and Aberystwith mail travels this line throughout the year. Birmingham and Worcester coaches sometimes run during the summer months. The most romantic Radnorshire road is one formed through the exertions of W. Pugh, Esq., formerly of Kerry, which leads from Newtown to Builth, traversing the county from north to south, and for the greater portion of its length is carried along the banks of the Ithon. The road from Builth to Rhayader, on the Radnorshire side of the Wye, is also highly picturesque and interesting. A new line of road from the former town to New Radnor has lately been formed.

There is no water communication of any description. The Radnorshire portion of the Wye is not navigable, and the other streams are too small or too rapid to admit of it. There is no canal in or through any part of the county. The Newtown and Montgomery Canal, in the latter county, however, is used for the exports and imports of the northern district of Radnorshire. There is a railroad from Kington in Herefordshire to the lime-works at Weythel and Old Radnor, a distance of four miles. It is principally used to convey lime and the coal used in burning it. The railroad from Kington communicates with Hay, Brecon, &c.

Geological Structure.—The principal portion of the county is composed of the strata forming the Silurian system; but on the west and north-west side of the county, the upper beds of the older rocks, composing the Cambrian system, make their appearance. These Cambrian rocks in Radnorshire have a general strike from north and south, or from north-east to south-west, and for the most part dip to the north-west. These rocks comprise perhaps one-fourth of the whole county, having in their extreme western and north-western limits a slaty character, which towards the interior or east is gradually changed to quartzose grit. The character of these rocks may be examined among the hills west of Llanbadarn-fynidd; along the Wye from Rhayader to Llangerrig, on the Aberystwith road; and in the romantic dingle of the Elan, where the strata are much contorted. They also form the summits of Camlo Hill, Rall, Wanalt, Rhiw-gwaith, Gwastaden, Dol-fau, &c. Proceeding east, the river Ithon forms, nearly exactly, the line of junction of the Cambrian rocks with those of the Silurian system: the latter however encroach somewhat on the west of the Ithon as that river approaches the Wye.

The lower Silurian rocks do not make their appearance at this junction; the members of the upper Silurian system resting unconformably on the Cambrian rocks. These upper

Silurians compose (with the exception of the trap rocks of Llandegley, &c., and the strata interlaced with them) the whole of the middle portion of the county; but the total absence of the two limestones of the system renders it impossible to distinguish with any accuracy between the different formations. There is no trace of the Wenlock limestone to define the boundary between the shale and the lower Ludlow rock, neither any Aymestry limestone to separate the lower from the upper Ludlow rock. The strata vary in direction from north-east and south-west to north-west and south-east. Radnor Forest is included in this district, and is chiefly composed of the upper Ludlow rock. The summit is a gritty sandstone, representing, according to Mr. Murchison, the lowest beds of the old red-sandstone.

On the eastern side of the county, at Old Radnor, and in the neighbourhood of Presteign, the strata are more varied and interesting. The trap rocks at the former place have brought to light the rocks both of the upper and lower Silurian system. At Nash and Corton, between Old Radnor and Presteign, the Caradoc sandstone may be seen highly inclined, and forming an anticlinal ridge, the beds dipping north and south, and throwing off on each side the Wenlock limestone and shale: characteristic fossils of these formations may be collected at Corton, Nash, and Woodside. 'There is not,' says Mr. Murchison, 'perhaps in Great Britain, a finer mass of altered and crystalline limestone than that exhibited at Nash Scar, the principal cliff of which rises to the height of 200 or 300 feet above the adjoining valley of Knill and Presteign.' This limestone is well developed at Old Radnor, where also traces of the lower Silurian rocks may be observed. The great tract of old red-sandstone, occupying the counties of Hereford, Brecon, &c., extends into Radnorshire, and occupies a considerable portion of the south-eastern part of the county. It enters Radnorshire at Llanstephen on the Wye, and extending eastward leaves the county near Huntingdon. Besides this extension of the great formation, there are three outliers of old red-sandstone of inconsiderable extent, and separated from the principal tract by the Ludlow rocks. The first lies between Presteign and Knighton, comprising an area of about five square miles. The second is situated west of Presteign, occupying the western side of Nash Scar, and appearing again on the high ground between Presteign and Harley Hill. This outlier is separated from the first by the valley of the Lug. The third is a long narrow slip between Old Radno and Gladestry, on the east side of Colva Hill. The strata of these three outliers are all more or less inclined, and attain considerable elevations.

The chief mass of trap rocks in Radnorshire is situated near the centre of the county, having a direction from north-west to south-east, and extending from Llandegley and Llanbadarn-fawr, on the north and north-east, to the neighbourhood of Builth on the south-west, being in length about ten miles and in breadth five; forming the Llandegley rock, and the ridges of Sunny-bank, Gelli, and the Carneddau. Parallel to the main ridge, on the eastern side, are a number of smaller elongated mounds of trap running in the same direction, and besides these there are numerous *stratified* traps, alternating with beds of marine deposit. Mr. Murchison enumerates twelve of these bands of bedded trap in a section of only 350 feet in length. The stratified rocks associated with the trap are various shales, flags, &c., but principally a dark-coloured shale, representing probably the Wenlock shale; all of them much altered by the action of the intrusive igneous rock. The stratified traps consist of felspar, and of quartz, rather porphyritic, and containing crystals of iron pyrites and some carbonate of lime. Mr. Murchison compares this district to the tract of Shelve and Corndon in Shropshire. The trap in the vicinity of Old Radnor before alluded to occupies two parallel ridges: the eastern, three miles in length, comprising Stanner Rocks, Worsel Wood, and Hanter Hill; and the western, called Old Radnor hill, about half the length of the other. The trap of the first ridge passes from a coarse crystalline hypersthene rock into fine-grained greenstone, and resembles the hypersthene rock of Coruisk in the Isle of Skye. The mass of Old Radnor hill is a dark greenstone, but there is a peculiar conglomerate thrown off on the western flanks, having a base of grey and green felspar, enclosing pebbles of quartz, some of a large size. 'From this composition,' says Mr. Murchison, 'it may be inferred that a stream of compact felspar, or submarine lava, entangled in it the sand and pebbles of a former bed of the sea.' It is a stratified deposit, occupying the same place in the series as the volcanic grits of the Caradoc which underlie the Wenlock limestone. The trap may be seen in many places in contact with and penetrating the Wenlock limestone, which close to the junction is completely unstratified. Minute veins of copper-ore and crystals of copper and iron pyrites occur in the altered bedded rocks, as well as nests and coatings of anthracite. There are various proofs that the volcanic rocks penetrated the limestone posterior to its consolidation. Mr. Murchison compares the phenomena at Old Radnor to those of the Val di Fassa in the Tyrol, the latter however being on a much larger scale. The intrusive volcanic rocks do not appear at the surface at Nash, but there is every proof of their immediate vicinity, and the Corton conglomerate strongly resembles a volcanic grit. There is another ridge of trap rock called Baxter's Bank, situated a few miles north-west of the Llangedley trap, parallel to it, and near the junction of the Cambrian system with the Silurian, which presents similar phenomena of altered and dislocated strata to those before mentioned. The superficial deposits are composed of the detritus of the adjacent rocks, and bear evident tokens of a drift from the north-west to the south-east.

Although all the strata of the county are inferior to the carboniferous rocks, yet many attempts have been made and are still in progress in search of coal, which the majority of the inhabitants believe to exist under the surface. The principal cause of this delusion has been the dark lead-coloured appearance of the shale before mentioned as existing in the neighbourhood of the trappean rocks; and accordingly, where the trap rocks protrude, levels are driven and shafts sunk, while a slight acquaintance with the principles of geological science would show such attempts to be utterly hopeless.

The medicinal springs of Llandrindod, Llandegley, and Blaen Edw all issue from the altered strata in junction with the trap rocks of the district, and, like the mineral springs in Brecknockshire, are supposed to owe their origin to the decomposition of iron pyrites and other mineral ingredients. There are three springs at Llandrindod, viz. a saline, chalybeate, and sulphur. The Llandegley and Blaen Edw waters are sulphurous. Llandrindod is much frequented in the summer months, and lies on the Builth and Newtown road, about seven miles from the former town. There are other medicinal springs in the county, but they are chiefly used by persons residing on the spot.

Surface and Agriculture.—A great portion of the county consists of common, bog, and moor land, and is therefore comparatively useless for agricultural purposes. It is supposed that nearly two-thirds of the county are unenclosed, but it is probable that were the population greater, the amount of waste land would be greatly diminished, as a large part merely requires to be enclosed to render it fit for profitable cultivation; while other portions, too steep or too exposed for agricultural purposes, might be successfully planted. The proportion of waste land however has been greatly diminished of late, as enclosures are gradually making, as well as considerable plantations of larch and fir; and a bill has lately passed through parliament for enclosing the waste land of three parishes, and this will probably be followed by others. But the waste lands, even in their uncultivated state, are of great value as sheep-walks, and as about one-fourth only of the enclosed land is under the plough, and many of the pastures (owing to the scarcity of manure and the want of an efficient system of draining) are barely superior to the common land, the policy of making extensive enclosures at present may well be questioned, especially as the expense of enclosing is nearly equal to the value of the fee-simple of the land. Planting however cannot be too much encouraged. Many of the manors (so called) were until lately in the hands of the crown; but most of them have been sold by the Commissioners of Woods, Forests, and Land Revenues, to private individuals, which has been the cause of considerable hardship to many poor persons residing within the manors on spots of ground formerly enclosed from the waste, and since claimed by the new proprietors of the manors.

Notwithstanding the thin population, the quantity of wheat grown in the county is considerably less than the consumption. The best wheat is grown on the eastern and south-eastern districts. Barley and oats are grown in considerable quantities on nearly all the farms. Potatoes are cultivated to some extent, and flax in small patches for home use. There are no hops grown in any part of the county. For purposes of sale, the main dependence of the Radnorshire farmer is on the stock reared on the pasture and common land; the latter not only support large quantities of sheep, but, in the most sheltered parts, cattle of all sorts. The cows are principally of the Herefordshire breed; the black Cardiganshire cattle are not extensively bred here. Numbers of Welsh ponies are also reared on the commons. Salt butter for winter use is an article of export. A scarcity of manure retards the improvement of the land. There is excellent lime at Nash and Old Radnor; but these places being situated on the border of Radnorshire, it has to be carried a great distance, and by hilly roads, to reach the interior and opposite districts of the county. Irrigation is universally adopted with the most beneficial results.

There is little cider fruit grown; the small quantity that there is, is confined to the parts adjoining Herefordshire. The quantity of rain and the damp fogs of the winter months, in the vicinity of the hills, seem to engender a moss on the young apple-trees planted as an experiment, which soon proves destructive to their fructification if not to their growth.

The farms are of various sizes; but it may be observed that the homesteads on the largest are generally much inferior to those of Herefordshire and other English counties.

Divisions, Towns, &c.—Radnorshire is divided into six hundreds, exclusive of the borough of Radnor, and contains fifty-two parishes and three market-towns.

Hundred.	Situation.	Population.
Colwyn	South and Central	2,632
Kevenlleece	Central	3,135
Knighton	North-east	5,213
Painscastle	South	4,226
Radnor	East and Central	2,544
Rhayader	West and North	4,440
Radnor Borough	Central	2,461
	Total	24,651

Presteign, the capital town, is situated in the hundred of Radnor, at the extreme eastern verge of the county, and is 151 miles north-west from London. The nearest road from Birmingham and Worcester to Aberystwith lies through this place. The valley in which the town stands is fertile, and watered by the Lug. Under the Reform Act it is a contributory borough with New Radnor, &c. in the election of a member of parliament. The boundaries of the borough for that purpose were settled by the 2 & 3 Will. IV., c. 64. It is in the diocese of Hereford. The derivation of the name Presteign is not known: the Welsh name is Llan Andras (the church of St. Andrew). The town is supposed to owe its rise to Martin, bishop of St. David's in the thirteenth century. The parish registers in existence commence as early as the year 1561. In one of them there is an entry stating that Charles I. passed two days and nights in a house in the parish, and from thence proceeded to Chester. The town now consists of four principal streets. The assizes and quarter-sessions are held here. The shire hall and county gaol are modern buildings. The market-day is Saturday. Fairs:—Sat. before Feb. 13, May 9, June 20, and October 13. The living is a rectory, with the chapelry of Discoed annexed, and the net value is returned at 795*l.* There are dissenting chapels of Wesleyan and Primitive Methodists: the Baptists also have a place of meeting. The church contains a curious and beautiful piece of tapestry placed over the altar, representing Christ's entry into Jerusalem.

The public walks, called Warden, are prettily situated on an eminence north-west of the town. The ground was presented to the inhabitants by the present earl of Oxford. The summit is supposed to have been the site of a castle; but, if any did exist, not a vestige now remains. There are no manufactures of any description here. The population of the entire parish, which is partly in the hundred of Wigmore, Herefordshire, in 1831, was 2282. The number of electors being 10*l.*-householders, registered September, 1839, was 91.

John Beddowes, a clothier, who lived in the reign of Elizabeth, founded a free grammar-school here, and endowed it with 140*l.* a year. The number of scholars in 1835 was forty-four. The schoolmaster is elected and the scholars admitted by a body of governors or trustees, under the terms of the bequest. The instruction is in reading, writing, and arithmetic. The books are supplied by the parents. There is a Sunday-school in connection with the Established Church, supported by subscription, with 100 scholars of both sexes. The teaching is undertaken by gratuitous instructors. There is also a Sunday-school connected with the Wesleyan Methodists. Besides these, there are several petty day-schools for boys and girls; but the education comprises nothing but reading and writing, and even this much is taught indifferently. The instruction is at the expense of the parents.

Presteign is the centre of a poor-law union consisting of nine parishes.

At Presteign was born Richard Lucas, the author of the 'Enquiry after Happiness,' who also acquired considerable reputation as a divine in the latter part of the seventeenth century. He was born in 1648, and entered a student at Jesus College, Oxford, in 1664, being then sixteen years of age. After proceeding in both degrees in arts, he took orders. His first appointment was to the mastership of the free grammar-school at Abergavenny; but being shortly after presented to the vicarage of St. Stephen's, Coleman Street, he removed to London. His great popularity as a preacher obtained for him the lectureship of St. Olave's, in the borough of Southwark, where he succeeded Dr. John Meriton, in October, 1683. Besides the 'Enquiry after Happiness,' he published some single sermons. Towards the latter part of his life he became totally blind. (*Beauties of England and Wales.*)

Knighton, the town next in size to Presteign, is situated six miles north of the latter place, in the hundred of Knighton, on the borders of Shropshire, from which it is separated by the river Teme, which enters Herefordshire about four miles below. The Welsh name is Tref-y-clawdd, which signifies 'the town upon the dyke,' Offa's Dyke running close to the town. [Wales.] The population of the parish in 1831 was 1259. This was, before the Reform Act, and still is, a contributory borough with New Radnor, &c. in returning a member to parliament. The town is awkwardly situated, being built on the side of a steep hill. The market is on Thursday, and is well attended by the neighbouring farmers. The living is a perpetual curacy, valued at 155*l.* per annum; patron, the warden of Clun Hospital. There was formerly a castle in a commanding situation at the upper part of the town, but it is now entirely destroyed There are three infant-schools and seven small day-schools; one of the latter endowed with 4*l.* per annum. In the others the children are taught at the expense of the parents. There are also two Sunday-schools, with 100 scholars.

Rhayader, the third market-town, lies in the hundred of the same name, and in the diocese of St. David's, on the banks of the river Wye; and the original name was Rhaiadyr-gwy, which signifies the 'fall of the Wye.' Before the present bridge of one large arch was erected, there was a considerable fall of water, but the channel was then deepened and cleared. Rhayader is on the western side of the county, adjoining Cardiganshire, and is 28 miles distant from Presteign, which, as before stated, is situated on the eastern border. The road from Birmingham, Worcester, and Cheltenham to Aberystwith is through this place. Rhayader derived antiently its chief importance from its castle, of which no vestige remains excepting the fosse, which was excavated out of the solid rock. It was very favourably situated on a precipitous point of land which projects into the channel of the river on the north of the town. This fortress was built about 1178, by Rhys-ap-Gruffyd, prince of South Wales, in order to check the depredations of the Norman freebooters.

The town is miserable and dirty in its appearance. The market-day is Wednesday. It is contributory with New Radnor, &c. in returning a member to parliament. A manufactory of flannel and coarse cloth is carried on here, but on a very small scale, twenty-two being the number of persons returned in 1831 as engaged in manufacture. The population (parochial chapelry) in the same year was 669. The living is a perpetual curacy, valued at 75*l.* per annum. The Methodists are numerous, and the Presbyterian Independents have lately erected a chapel. There are five day-schools, one of which is an endowed grammar-school: two others belong to Dissenters, viz. Independents and Calvinistic Methodists: three Sunday-schools, one of which, belonging to the Wesleyan Methodists, is said to consist of 45 males and 42 females; another to Independent Dissenters, of 140 children; and the other to Calvinistic Methodists, of 90 males and females. These Sunday-schools are supported by their respective congregations. It is probable that many children attend two of these schools, by which an error has crept into the Parliamentary Returns. A mechanics' association has lately been established.

New Radnor, or Maes-yfed Newydd, formerly the capital of the county, and a place of some consequence, is now degenerated into a village, and, but for some privileges which are still retained by the inhabitants, would not be worth noticing. The borough of New Radnor comprises about one-fifth of the county, and includes the parishes of New and Old Radnor, Llanvihangel, Nantmellan, and part of Cascob. Meredydd ab Owain destroyed the town about the year 900. It was again burnt in the reign of Henry IV., and was never restored to its former state. Being a station of considerable importance in guarding one of the principal passes into the territory of the Welsh princes, it was particularly liable to these vicissitudes. Its present condition may be ascribed, first to its ceasing to be kept fortified and garrisoned as a frontier town, its proximity to Presteign and Kington, and its cold situation and the scarcity of fuel. The walls of the castle may still be traced upon a height north of the village. The burgesses and freemen of this borough, and (since the Reform Act) 10*l.*-householders, vote in the election of a member of parliament. The total number of electors in 1832 for the united boroughs of New Radnor, Presteign, Knighton, Rhayader, Kunklas, and Cefu Llys were,—freemen, 276; 10*l.*-householders, 253: total constituency, 529. The corporation consists of 25 capital burgesses, who are the common council and governing body; a bailiff, two aldermen, a recorder, town-clerk or prothonotary, a receiver, auditor, two chamberlains, two serjeants-at-mace, and an indefinite number of free burgesses.

Under the terms of the charter, the borough magistrates have equal power with county magistrates in the trial of felonies and other crimes and misdemeanors, and a court of quarter-sessions is accordingly held in the borough, the recorder, bailiff, or senior magistrate presiding; but the majority of offences committed within the borough are disposed of at the county sessions, under the 5 Geo. IV., c. 85. There is also a Court of Record held weekly for the recovery of debts under 40*s.* The county courts of the sheriff for the recovery of debts under 40*s.* are held here and at Presteign alternately. The market has long been discontinued, but sveral fairs are still held here in the course of the year. The population of the parish, in 1831, was 472. The living is a rectory, valued at 304*l.* per annum. There is one daily school for children of both sexes, partly supported by an endowment of 10*l.* a year for the instruction of twenty children, partly by a donation of 5*l.* from the member for the borough, for the instruction of five others; the rest are paid for by their parents. There are also a small school held three times a week for girls to learn to sew and knit, and also to spell, and one Sunday-school, with about 70 children, the teaching in which is principally gratuitous.

Old Radnor, or Maes-yfed Hen, called also Pen-y-Craig, or 'the summit of a rock,' stands on an elevated situation, about two miles south-east of New Radnor. The parish of Old Radnor is extremely large, comprising six townships. The population in 1831 was 1458. The church is prettily situated, and contains a curiously carved wooden screen. The six bells are noted for the richness of their tones. The living is a rectory, valued at 108*l.* per annum. Camden supposed Old Radnor to have been the Magnus of Antoninus, but this is now discredited. Sir Richard Hoare identifies the castle (of which there are at present no remains) with the Cruker Castle of Giraldus, this name being an easy corruption of crug or craig.

The peculiarities of Old Radnor in a geological point o view have been already noticed.

Division for Ecclesiastical and Legal Purposes.—The eastern side of the county is in the diocese of Hereford, and the western in that of St. David's; the former comprising the parishes of Presteign, Old and New Radnor, Norton, and Knighton. The parishes are, as before stated, 52 in number, viz. 14 rectories, 16 vicarages, and 22 perpetual vicarages.

The county is in the South Wales circuit. The assizes are held at Presteign, from which place the judge proceeds to Chester, and there meets the judge of the North Wales circuit. The legal jurisdiction of the borough of New Radnor has been noticed.

One member of parliament is returned for the county, no alteration having been made in this respect by the Reform Act. One member is also returned for the borough of New Radnor, in conjunction with the boroughs of Knighton, Rhayader, Kevenlece, and Kunklas, and the town of Presteign, the latter place being added by the Reform Act. The place of election for the county is Presteign; the polling-places are New Radnor, Presteign, Rhayader, Painscastle, Colwyn, Knighton, and Penybout. The election for the boroughs is held at New Radnor.

History, Antiquities, &c.—Radnorshire originally formed part of the territory inhabited by the Silures, and, after its subjugation and ultimate abandonment by the Romans, was included in one of the petty principalities into which Wales was divided, and the history of Radnorshire is naturally merged in that of Wales. The two principal events relating to it are, the conquest of it by Caradoc Vraich Vras, and its subsequent subjugation, in the beginning of the tenth century, by Elystan Glodrydd, who fixed his residence there. After the Norman conquest, it became the prey of the Norman adventurers, who obtained a settlement in the counties of Hereford and Brecknock; but principally of the Mortimer family, and afterwards of that of De Breos, who at one period held large possessions there. In the reign of Henry VIII., Radnor was formed into a county.

The Welsh name for this county, Maeshyved, is supposed to be derived from Hyfaidd, one of the sons of Caradoc Vraich Vras, before mentioned, who formed this portion of it into a lordship for his son.

That the Romans penetrated far into the county seems to be satisfactorily ascertained; for although the supposition of Camden that Old Radnor was the Magnus of Antoninus is now generally discredited, yet there is a Roman station at Cwm, situated on the right bank of the river Ithon, about midway between Llanbadarn-fawr and Disserth, and two miles north-west of Llandrindod. The form of the camp is a perfect square, including an area of about four acres. Forest Colwyn, or Colunwy Castle, on the road leading from New Radnor to Builth, and in the parish of Llansaintfraed, also appears to be of Roman origin. It is also sometimes called Maud's Castle; a name derived, it is said, from Maud de St. Waleri, the wife of William de Breos, who at one period owned this place. Radnorshire being a border county, the remains of British encampments are numerous, especially on the eastern side adjoining Herefordshire.

Offa's Dyke, the boundary formed by Offa between his kingdom of Mercia and the territories of the Welsh princes, enters Radnorshire on the north at Knighton, and the turnpike-road leading from that place to Presteign crosses it twice. The latter town lies about four miles on the English side. Running south, it enters Herefordshire at Berva Bank, a steep hill on the right of the turnpike-road between Presteign and New Radnor. On this hill are the remains of an antient fortification, probably erected to defend this boundary. The dyke can be easily traced on the high uncultivated ground, but in the valleys it is nearly obliterated. In addition to mere encampments or temporary entrenchments, there were several castles in this district, but their remains are very imperfect. One tower of Aber Edw castle remains. It is situated close to the romantic village of Aber Edw, near the junction of the Edw with the Wye, about six miles below the town of Builth. This castle belonged to Llewellyn ap Griffyth, and was that prince's last retreat. He came hither from Snowdonia, in 1282, to obtain assistance against Edward I.: finding however that Edmund Mortimer and John Gifford had marched with troops from Herefordshire to meet him, he retreated with his followers to Builth, where he crossed the Wye, but was refused admittance into the town by the garrison. He then ascended the Irvon, and stationed his followers on the northern side of the river. Llewellyn was here attacked unarmed, and killed by one Adam de Francton. [BRECKNOCKSHIRE.]

No vestige of the walls of the castle of New Radnor remains, but it appears to have been a place of some strength and of great importance, as it commanded one of the passes from England into Wales. Old Radnor was burned in 1216 by King John, in revenge for an insurrection of Llewellyn, prince of North Wales, and his son-in-law Reginald de Breos; and New Radnor, as already observed, was destroyed in the reign of Henry IV.

The battle of Pilleth, fought between the earl of March and Owen Glendower, occurred on a hill near Knighton, and takes its name from the little village of Pilleth.

The only monastic establishment in Radnorshire seems to have been that of Abbey Cwm Hir, or the Abbey of the White Monks. It is romantically situated in a narrow valley surrounded by high hills, in the north-western portion of the county, to the left of the road leading from Llandewy to Newtown. Leland ascribes the foundation of it to Cadwaltulan, or Cadwallon ab Madoc; and the 'Monasticon' assigns to it the date of 1143. Cadwallon was about this period the lord of the province of Machinydd, in which it was situated. The monastery was dedicated to St. Mary, and originally endowed for sixty monks of the Cistercian order, but it contained only three when the establishment was broken up, and was granted, 37th Henry VIII., to Walter Henley and John Williams. The only remains of the edifice are part of the exterior walls and the foundation of the pillars which supported the arches; from these there appears to have been one continuous building of 255 feet in length by 73 in width, exceeding in length, according to Leland, any other church in Wales. Some of the columns and arches of the abbey were removed to Llanidloes, and may be now seen in the church of that place. [MONTGOMERYSHIRE.] The antient font and screen at Newtown were also taken from Abbey Cwm Hir.

STATISTICS.

Population.—Of 6269 males of twenty years of age and upwards, 4394 were, in 1831, employed in agriculture. The number of occupiers not employing labourers and of occupiers who do employ labourers is nearly equal, the numbers of the former, according to the census, being 911, and of the latter 1032. The number of agricultural labourers was 2451. There were a few weavers in the county, but the number of persons returned as employed in manufactures, or in making manufacturing machinery, was only 42; but there were 232 labourers employed in non-agricultural occupations.

The population of Radnorshire at each of the four following periods was—

	Males.	Females.	Total.	Increase per Cent.
1801	"	"	19,050	
1811	"	"	20,900	9·71
1821	11,266	11,193	22,459	7·45
1831	12,453	12,198	24,651	9·76

showing an increase between the first and last periods of 5601, or nearly 27 per cent., which is less than any other county, with the exception of Merionethshire; but in Radnorshire the rate of increase has been more uniform. In the first thirty years of the present century the population increased less than might be inferred from the number of the births, and there is no doubt that many natives of the county migrate to other parts. In the ten years ending 1831, the number of registered baptisms was 6571, marriages 1653, and deaths 3651. From 1813 to 1830 nine centenarians died, namely, two aged 100, one aged 101, two aged 102, and one each respectively aged 103, 104, 105, and 108.

The following table contains a summary of the population &c. of every hundred at the census in 1831:—

HUNDREDS AND BOROUGH.	HOUSES.				OCCUPATIONS.			PERSONS.			
	Inhabited.	Families.	Building.	Uninhabited.	Families chiefly employed in Agriculture.	Families chiefly employed in trade, manufactures, and handicraft.	All other Families not comprised in the two preceding classes.	Males.	Females.	Total of Persons.	Males, twenty years of age.
Colwyn (Hundred)	481	545	—	24	411	92	42	1,343	1,289	2,632	651
Kevenlleece "	518	591	1	17	431	83	77	1,584	1,551	3,135	829
Knighton "	929	1024	4	32	548	250	226	2,659	2,554	5213	1302

Totals	4437	4879	18	167	3135	1028	716	12,453	12,198	24,651	6269

County Expenses, Crime, &c.—In the three years 1748-49-50, the average sum assessed annually for poor's rate was 1117*l*., and the sum expended for relief amounted to [illegible]57*l*.; in the three years 1783-4-5 the annual assessment averaged 4448*l*., and the expenditure for the relief of the poor 3889*l*. The sums expended for the maintenance of the poor in the several under-mentioned years were—

	£	Per head. s.	d.		£	Per head s.	d.
1811	12,065	11	6	1835	11,517	9	4
1821	11,974	10	7	1836	10,853	8	7
1831	13,571	11	0	1837	9,965	8	1
1834	13,072	10	7	1838	8,266	6	8

From 1811 to 1838 the population had increased about 2[illegible] per cent., while the sum required for the relief of the poor had decreased 32 per cent.; and comparing 1838 with 1834, there has been a diminution of expenditure under this head amounting to 4806*l*. or 38 per cent. The whole of the parishes in the county are in unions under the provisions of the Poor-Law Amendment Act. In 1835-6 the number of bastards chargeable to parishes in the county was 417, or 1 in [illegible] of the total population, the proportion for Wales being 1 in 139, and for England 1 in 215. The numbers affiliated in the former of these years was 110, and in the latter 92. In 1830 the number of illegitimate births to the total number of births was 1 in 7, being a higher average than for any part of the kingdom, the proportion for Wales being 1 in 13, and for England 1 in 20.

The sum raised in the county for poor-rate, county-rate, and other local purposes, in 1833, was 17,045*l*., levied upon the following descriptions of property:—

On land	£15,943
Dwelling-houses	1,033
Mills, factories, &c.	23
Manorial profits, navigation, &c.	45
Total	£17,045

Under the property-tax the county was assessed in 1815 at 10,357*l*., namely, property from lands 90,652*l*., houses 1966*l*., tithes 10,960*l*.: the property assessed to the occupier was 90,524*l*. The annual profits of trade were assessed at 3,714*l*.

The total receipts and expenditure under the head of county-rate were as follows in each of the under-mentioned years:—

	1792. £	1801. £	1811. £	1821. £	1831. £	1838. £
Total receipts	220	894	932	1795	2420	2251
Expenditure	307	983	762	1986	2692	1988

The receipts and expenditure on account of church-rates in 1839 were as follows:—amount received 662*l*., namely, church-rates 637*l*., from other sources 25*l*., expenditure 665*l*., of which 255*l*. were laid out in the repair of churches.

In the three years ending October, 1812-13-14, the length of paved streets and turnpike roads in the county was 76 miles; and the length of all other highways used for wheel carriages was 410 miles. The amount levied annually for the repair of highways in the above years was 166*l*.; compositions in lieu of statute labour, 281*l*.: making the total sum received by surveyors of the highways 447*l*. annually. The value of statute labour performed in kind was estimated at 1313*l*., and the total sum expended in money and the estimated value of statute labour was 1767*l*. In 1839 the expenditure on highways amounted to 1980*l.*, length of roads 478 miles; cost of repair per mile 4*l.* 2*s.*, the average for Wales being 11*l.* 3*s.*

There are only two turnpike trusts in Radnorshire. In 1835 the income from tolls was 1582*l.*, parish composition in lieu of statute duty 713*l.*, estimated value of statute duty performed 565*l.*: total income 3347*l.* The expenditure amounted to 3318*l.*; there were debts incurred to the amount of 17,233*l.*, of which 14,471*l.* were bonded or mortgage debts.

Crime.—The number of persons charged with criminal offences and committed in the three septennial periods ending 1820, 1827, and 1834, was 67, 76, and 96, making the annual average of the three periods respectively 9, 11, and 13. The average of the six years from 1834 to 1839 was 18; and the numbers committed, convicted, and acquitted in each year were as follow:—

	1834.	1835.	1836.	1837.	1838.	1839.
Committed	18	15	15	18	15	31
Convicted	13	10	8	10	8	15
Acquitted	5	5	7	8	7	16

During the above six years the number of male offenders was 89, females 23; but the number of the latter in 1839 was only one short of the number in the preceding five years. In 1834 (an average year) the number of criminal offenders to the population was 1 in 1369, being higher than any Welsh county, with the exception of Monmouth, Denbigh, and Glamorgan; in 1835 the proportion in Radnorshire was 1 in 1643, the proportion for England and Wales being 1 in 631. In so small a population it would not be satisfactory to give the average proportion of crimes committed, the ages of the offenders, and the degree of instruction which they have received, as the results could not be safely depended upon; but it may be stated, on a review of the absolute numbers in the tables of each year, that juvenile crime is comparatively rare, that the majority of offences are those against property committed without violence, and that of the offenders a larger proportion are totally uninstructed than in the whole of England and Wales.

Of the 31 persons committed in 1839, one male and one female were above 12 and under 16; nine males and eight females were between 16 and 21 years of age; and the remainder were of various ages between 30 and 60. There were 4 males and 6 females who could neither read nor write; 15 males and 5 females could read and write imperfectly, and the degree of instruction was not ascertained in one case. The nature of the offences was as follows:—5 were offences against the person (4 were assaults), 2 against property attended with violence, 23 against property unattended with violence (22 being cases of simple larceny), and 1 offence against the laws relating to forgery and the currency: there was not one person charged with malicious offences against property. Of the 15 persons convicted, two were transported, and 13 imprisoned, fined, or whipped.

The number of parliamentary electors registered to vote for the county was 1857 in 1835, and 2034 in 1839. During these four years the number of registered occupying tenants at a rent of 50*l.* per annum had increased from 521 to 572.

There is no savings' bank in the county.

Education.—The following summary is taken from the Parliamentary Returns of 1835:—

	Schools.	Scholars.	Total.
Infant Schools	4		
Number of infants at such schools; ages from 2 to 7 years		31	
Daily schools	59		
Number of children at such schools; ages from 4 to 14 years:—			
Males		282	
Females		231	
Sex not specified		930	
Schools	63		
Total of children under daily instruction			1,474
Sunday-schools	35		
Number of children at such schools; ages from 4 to 15 years:—			
Males		301	
Females		394	
Sex not specified		821	
			1,516

Maintenance of Schools.

Description of Schools.	By endowment.		By subscription.		By payments from scholars.		Subscrip. and payment from scholars.	
	Schls.	Scholars.	Schls.	Scholars.	Schls.	Scholars.	Schls.	Scholars.
Infant Schools	—	—	—	—	4	31	—	—
Daily Schools	12	255	2	77	41	963	4	138
Sunday Schools	1	40	31	1,347	1	96	2	103
Total....	13	305	33	1,424	46	1,020	6	241

The schools established by dissenters included in the above statement are:—

	Schools.		Scholars.
Infant-schools	1,	containing	17
Daily-schools	3		68
Sunday-schools	10		552
The schools established since 1818 are—			
Infant and other daily schools	22		447
Sunday-schools	30		1341

No boarding-schools are included in the number of schools given as above; and there does not appear to be any Lancasterian school in the county. Of Sunday-schools 5 are returned from places where no other schools exist, and the children (138) did not probably attend any other school; 4 schools, attended by 129 children, are both day and Sunday schools, and duplicate entries are made to that extent; but how far this may have been done in other cases cannot be ascertained from the Parliamentary Returns. None of the schools in the county appear to be for the exclusive use of any particular sect. There are no lending libraries attached to any of the schools.

RAEBURN, HENRY, the son of a manufacturer at Stockbridge, near Edinburgh (which now forms part of that city), was born there on the 4th of March, 1756. He lost both his father and mother whilst young, and was apprenticed by his elder brother to the business of a goldsmith. During the time of his apprenticeship he painted miniatures, though in what manner his taste first showed itself is not exactly known; but it is asserted that it certainly was altogether spontaneous, without lesson or example, and was developed before he ever saw a picture. These works were executed in such a manner as to attract notice. His master took him to see the pictures of David Martin, which made so great an impression on Raeburn, then only about sixteen or seventeen years of age, that he redoubled his exertion. He continued to paint miniatures, which were soon in general demand, and as his time was thus fully occupied, completing (as he did) two in a week, his master agreed to allow him to withdraw from the trade, receiving, as an equivalent part of the young painter's earnings.

Obtaining some of Martin's pictures to copy, he adopted oil-painting and after a time wholly abandoned miniatures. At the expiration of his apprenticeship, he became a portrait-painter, and gained very extensive practice. In 1779 he married, and some time after came to London, where he was much noticed by Sir Joshua Reynolds, who advised him to visit Italy, a course which he accordingly pursued, and remained in Rome and other places in Italy two years, carefully studying the works of the great masters. In 1787 he returned and established himself in Edinburgh, where in a short time he became the chief portrait-painter. He was elected a member of the Royal Society of that city, of the Imperial Academy of Florence, and of the South Carolina and New York academies. On the 2nd of November, 1812, or, as stated by some, in 1814, the Royal Academy of London elected him an associate of their body, and on the 10th of February, 1815, he was made an academician. On the visit of George IV. to Scotland in 1822, Raeburn was knighted at Hopetown-house, and in the summer of the following year he was appointed portrait-painter to the king for Scotland, an honour which he did not long enjoy. He died on the 8th of July, 1823.

Amongst his chief portraits may be enumerated those of Lord Eldin, Sir Walter Scott, Dugald Stewart, Professor Playfair, James Watt, Francis Jeffrey, Henry Mackenzie, John Rennie, and Sir Francis Chantrey. His style was free and bold, his drawing critically correct, his colouring rich, deep, and harmonious, and the accessories, whether drapery, furniture, or landscape, always appropriate, and though carefully executed, were never made too distinct or allowed to become obtrusive. He had a peculiar power of rendering the head of his figure bold, prominent, and imposing. The strict fidelity of his representations may in a great degree be attributed to his invariable custom of painting, whether the principal figure or the minutest accessory, from the person or the thing itself, never giving a single touch from memory or conjecture. It has been judiciously said that all who are conversant with the practice of the art must have observed how often the spirit which gave life and vigour to a first sketch has gradually evaporated as the picture advanced to its more finished state. To preserve this spirit, combined with the evanescent delicacies and blendings which nature on minute inspection exhibits, constitutes a perfection of art to which few have attained. If the works of Sir Henry Raeburn fail to exhibit this rare combination to that degree, to this distinction they will always have a just claim, that they possess a freedom, a vigour, and a spirit of effect, and convey an impression of grace, life, and reality which may be looked for in vain amidst thousands of pictures, both ancient and modern, of more elaborate execution and of minuter finish.

(*Annual Biography and Obituary*, vol. viii.; Allan Cunningham's *Lives of Painters*.)

RAFFAELLE. [Raphael.]

RAFFLES, SIR THOMAS STAMFORD, the son of a captain in the West India trade, was born at sea, off Jamaica, July 6, 1781. His early education was imperfect, for he was taken from school at the age of 14, and placed as an assistant clerk in the India House. In that situation he showed so much talent and industry, that he attracted the notice of the directors, and in 1805 was appointed under-secretary to the new government formed by the East India Company at Pulo-Penang, or Prince of Wales' Island. There he devoted his attention to the study of the Malay language, the vernacular dialect of almost all the Eastern islands, in which he made rapid progress, as well as in a knowledge of the productions of Penang and the adjoining country, and the manners of the inhabitants. These acquirements rendered him so useful to the government, that he was soon appointed chief secretary, an office which he filled with the greatest ability; intense application in an unhealthy climate however, soon brought on serious illness, which compelled him to go to Malacca, in 1808, for the recovery of his health.

During his stay at Malacca, Raffles had an opportunity of mixing with a great number of natives congregated there from all parts of the Archipelago, from China, Cochin-China, &c., with whom he freely associated. He thus obtained a very considerable knowledge of their customs, trade, and languages, which was afterwards of great value to him. In 1809 he published his first literary essay, 'On the Malay Nation,' by which he attracted the notice of Lord Minto, governor-general of India, who sent for him to Calcutta, and was anxious to place him in the government of the Moluccas. Other events however interfered with this intention, for Raffles so strongly represented to Lord Minto the advantages which would accrue to the English government from the reduction of the Dutch settlement of Java (Holland being at that time annexed to France), that an expedition was fitted out against Batavia in 1811, which was attended with complete success, that place being speedily captured. Raffles offered such valuable assistance in the preliminary arrangements of this expedition and in the execution of it, that he was appointed 'Lieutenant-Governor of Java and its dependencies.' He was only thirty years of age when he undertook this responsible situation, which he held for five years, being recalled in 1816, shortly before the island was restored to the Dutch. In his administration he evinced great energy of character, and displayed an anxious desire to advance the welfare of the native population. He found it necessary to make great alterations in the economy of the government, and a complete revision of the judicial system of the colony. He likewise abolished the system of slavery in the island. The policy of some of his measures was considered doubtful by the authorities at home, and his youth made him an object of jealousy to some of his colleagues; a number of charges were consequently brought against him, which led to his recal. But the board of directors of the East India Company afterwards acknowledged that his measures were all undertaken from most benevolent and laudable motives. Raffles devoted a considerable portion of time to the investigation of the natural productions of Java, and during his residence there he made many excursions into the interior, and collected much geological and geographical information respecting the island, as well as many interesting facts concerning the numerous ruins and other antiquities, and the character of the different native tribes. He arranged and published the different materials which he had thus collected, on his return to England, in his 'History of Java,' which appeared in 1817, 2 vols. 4to.

In 1818 he was appointed lieutenant-governor of Fort Marlborough, the seat of the English government at Bencoolen, on the island of Sumatra, and again returned to India, having first received the honour of knighthood. He remained at Bencoolen six years, during which time he effected many improvements in the political constitution of the colony and in the condition of the inhabitants. He emancipated the slaves here, as he had done in Java, for which act he did not however escape censure. He established a British settlement at Singapore, which has proved an important commercial station, and founded a college there for the encouragement of Anglo-Chinese and Malay literature. Though distinguished by his administrative abilities, Sir Stamford Raffles owes his reputation chiefly to his researches into the natural productions of Sumatra, and particularly to his numerous zoological discoveries. During one of his journeys into the interior, accompanied by the enterprising and lamented Dr. Arnold, he discovered the gigantic parasitical plant (or rather flower) which has been called the *Rafflesia Arnoldi*. In 1820 he sent home a large collection of preserved animals, which are now in the museum of the London Zoological Society. A paper containing a description of them was read before the Linnean Society, and published in their 'Transactions.' The excitement of various official and scientific engagements in a pestilential country, together with many domestic afflictions (four out of his five children, and almost all his personal friends, dying from the effects of the climate), so completely destroyed his health, that he was obliged to resign his appointment and return to England in 1824. In February of that year he embarked with Lady Raffles on board the ship *Fame*, which took fire the same night, by the carelessness of the steward. The crew and passengers with difficulty saved themselves in the boats, and Sir Stamford was obliged to remain at Bencoolen till the following April. By this disastrous event he entirely lost the greatest part of the extensive collection which he had formed of animals and plants, as well as many volumes of manuscripts and drawings relative to the civil and natural history of nearly every island in the Malayan Archipelago; besides this, which might be considered as a public loss, his own pecuniary loss by the burning of the ship amounted to upwards of 20,000*l.*

After his return to England he founded the present Zoological Society, of which he was the first president. His health however never recovered the shock which it had sustained, and he died in 1826, before he had had time to arrange the numerous materials which he had collected in the East. He left several manuscripts behind him. (*Memoir by Lady Raffles.*)

RAFFLE'SIA is the name of a plant found in the hot damp jungle of Sumatra, growing parasitically on a kind of vine, and discovered by the late Sir T. S. Raffles, whose name it bears. It consists of a number of scales investing a fleshy calyx measuring a yard in diameter, and containing the organs of fructification within or beneath the rim of a huge fleshy central column.

This and some other plants related to it, which are equally parasitical, are regarded as intermediate between such imperfect plants as fungi and the class of Endogens, and constitute the class now called Rhizanths.

(Lindley's *Natural System of Botany*, ed. 2, p. 389; Blume's *Flora Javæ*; and *Linnean Transactions*, vol. xiii.)

RAGHUVANSA. [Calidasa.]

RAGMAN'S ROLL, the uncouth name of the collection of those instruments by which the nobility and gentry of Scotland were constrained to subscribe allegiance to Edward I. of England in 1296, and which were more particularly recorded in four large rolls of parchment, consisting of thirty-five pieces sewed together, kept in the Tower of London. These instruments are for the most part extant in the third volume of Prynne's 'Records,' from p. 648 to 663, and have been recently but more correctly printed, under the auspices of the Bannatyne Club,* at the expense of the Right Honourable William Adam and the Right Honourable Sir Samuel Shepherd. These records contain the

* [illegible]

largest and most authentic enumeration now extant of the nobility, barons, landholders, and burgesses, as well as of the clergy of Scotland, prior to the fourteenth century.

The original and proper meaning of the word *ragman* has given much trouble to our etymologists; from other instruments and records however it seems clear that in diplomatic language the term ragman imports an indenture or other legal deed executed under the seals of the parties; and consequently that its application to the Rolls here in question implies that they are the record of the separate ragmans, or sealed instruments of homage and fealty, executed by the people of Scotland.

The 'Encylopædia Britannica' and Rees's 'Cyclopædia' speak of Ragman's or Ragimund's Roll as a roll denominated from Ragimund, a papal legate in Scotland, who, calling before him all the people who held benefices in that kingdom, caused them, upon oath, to give in the value of their estates, according to which they were taxed in the court of Rome. But this derivation evidently rests on a misnomer. No legate of the name of Ragimund ever visited Scotland. The name of the legate referred to was Bagimund, and his visit to Scotland to form his taxation was in 1274. (Spotswood's *Hist.*, p. 46.) Fordun, lib. x., c. 36, p. 122, calls him Bajamondus.

At the end of the second volume of Nisbet's 'Heraldry,' fol., p. 1-46, Edinb., 1742, there is a collection of 'Historical and Critical Remarks on Prynne's History, so far as concerns the submission and fealty sworn by the generality of the Scots Nation to King Edward I. of England in 1292, 1296, 1297, &c., commonly called Ragman-Roll.'

Much is said upon the various etymologies of Ragman's Roll in Jamieson's 'Etymological Dictionary of the Scottish Language,' vol. ii., in *voce*.

RAGU'SA or RAU'GIA (Rhacusa, in Latin; Dubrounik, in Sclavonian), a town in the kingdom of Dalmatia, subject to Austria, but formerly an independent state. It is situated on the eastern coast of a peninsula of the coast of Dalmatia, formed by the gulf of Breno on the east and the gulf of Santa Croce or Ombla on the west. The territory of Ragusa, which forms one of the four circles into which Dalmatia is now divided, extends along the sea-coast for about 90 miles, from the western shore of the Gulf of Cattaro to the north-west extremity of the peninsula of Sabioncello opposite the island of Lesina, which belongs to the circle of Spalatro. The width of the territory of Ragusa bears no proportion to its length, extending only a few miles inland, where it borders on the Turkish sandjak of Hertsek, which is part of the pashalik of Bosnia. On the west the territory of Ragusa is separated from the coast of Dalmatia by a tongue of land called Klek, which belongs to Turkey. The territory of Ragusa is in fact the coastline of the Hertsek or Turkish Dalmatia, and consists of a narrow strip of land between the mountains and the sea, and a few valleys in the mountains; it includes also the long low peninsula of Sabioncello, and the island of Meleda, which is nearly 30 miles long and two or three broad, Lagosta, which is 18 miles in circumference, Shupan, 9 miles in circumference, Mezzo, 5 miles in circumference, and some smaller islands or rocks. The fine island of Corzola, or Curzola, which is now annexed to the circle of Ragusa, did not belong formerly to that state, but was part of the Venetian province of Dalmatia. [CURZOLA.]

The mountains which run along the coast of Ragusa are a continuation of the mountains of Montenero, which divide Albania from the Hertsek [MONTENERO], and they are generally destitute of trees. But some longitudinal valleys which lie within these mountains are very fertile, and abound with copious springs, though no river, properly speaking, crosses the territory of Ragusa. The principal valleys are—1, that of Canale, extending more than 20 miles in length from Ragusa Vecchia to the shores of the Gulf of Cattaro near Castelnuovo; 2, the valley of Giuncheto, farther inland than Mount Bargat, or Vergato, the mountain which overtops the town of Ragusa; and 3, Val di Breno, east of Ragusa, which is three miles long and about two miles wide. The two last valleys are planted with vines and fruit-trees, and contain pleasant country-houses of the wealthy Ragusans.

The capital, Ragusa, is situated in 42° 38′ N. lat. and 18° 8′ E. long., and is built partly at the foot and partly on the steep declivity of two hills: it is fortified with walls and ditches, and has a castle on the east, at the entrance of the harbour, and another at the western end of the town. The streets are paved, but very narrow, except two: the houses, which are built of freestone, are generally large and commodious. The principal buildings are, the cathedral, which is a good structure, and the palace of the government, which is extensive, and has some fine halls and galleries. The town is well supplied with spring-water. Outside of the walls are numerous gardens and country-houses, with plantations of orange and other fruit trees, and handsome fountains. From Ragusa along the western coast as far as the creek of Ombla, a distance of about three miles, there is an almost continuous suburb. The sea is deep along the coasts, and abounds with fish. The surrounding country produces abundance of fruit and very good wine: the malmsey of Ragusa has a great reputation, and forms an article of export. Cattle and cheese are brought in from the neighbouring mountains. The country produces little corn and oil; what is wanted is imported by sea. The climate of Ragusa is temperate and healthy, and instances of great longevity are not uncommon. The population of Ragusa, which is said to have once amounted to 30,000 inhabitants (Razzi, *Storia di Raugia*, 1595), is now only about 6000. Its maritime trade, which, during the period of its independence, was very flourishing, owing to the acknowledged neutrality of its flag and the protection of the Ottoman Porte, which secured it against the Barbary pirates, was almost annihilated after the French occupation in 1806; but it has somewhat revived since the peace. The Ragusans are reckoned among the best sailors in the Mediterranean, and have a good character for honesty and steadiness. Ship-building, manufactures of soap, liqueurs, and tobacco, are the chief branches of industry. Two miles west of Ragusa is the fine harbour of Gravosa, with docks for ship-building, and fine country-houses and gardens. Timber is carried thither from the opposite coast of Monte Gargano in Italy. Ragusa is a bishop's see, and has a lyceum and other literary institutions. It has produced several learned men: among others the mathematician Boscovich; Father Kunich, long professor of classical literature at Rome; Giacomo Luccari, the historian of Ragusa; the learned Banduri, author of the 'Imperium Orientale,' in the Byzantine collection; Benedetto Stay; Dr. Stulli, a physician and naturalist; and Tommaso Chersa: the last three died in the present century. Father Cerva, a Dominican, wrote biographies of the writers who are natives of Ragusa. Filippo de' Quartigiani, a native of Lucca, but who lived at Ragusa about the middle of the fifteenth century, wrote a kind of statistics of Ragusa, which has remained inedited. The language of the country is a dialect of the Sclavonian, resembling that of the neighbouring province of Hertsek, but more refined: all the educated people speak Italian, which, together with Latin, are the literary languages of the country. Ragusa has always maintained an intimate connection with Italy. (*Notizie istorico-critiche sulle Antichità, Storia, e Letteratura dei Ragusei*, 2 vols., 8vo. Ragusa, 1803.)

A few miles east of Ragusa is Ragusa Vecchia, on or near the site of the antient Epidaurus in Illyria, a Roman colony mentioned by Hirtius (*De Bello Alexandrino*, c. 44). The other towns of the territory of Ragusa are, Slano, a small place about fifteen miles north-west of Ragusa, and Stagno, about ten miles farther in the same direction. The latter, which is strongly fortified, is on the isthmus leading to the peninsula of Sabioncello. The island of Meleda contains six villages. The population of the whole circle of Ragusa is reckoned at 41,000.

History of Ragusa.—Ragusium, or Rausium, seems to owe its origin to the fugitive inhabitants of Epidaurus in Illyria, which was destroyed by the Slavi in the sixth century of our æra. The name of Rausium is said by Constantine Porphyrogennetus (*De Administrando Imperio*, c. [illegible]) to be derived from 'lau,' a rock; from which was made 'Lausæi,' 'living upon rocks,' for such was the original situation of Ragusa; hence by corruption Rausa or Raugia, and Rhacusa. In the seventh century the population of Ragusa was much increased by emigrants from Salona, from Ascrivium (new Cattaro), from Dulcigno, and other towns of Dalmatia and Albania, and the town of Ragusa was then enlarged and fortified. The people organised their municipal government, consisting of a general council, composed of the members of the principal families, from which council the members of the senate, or executive, were drawn by lot. The chief magistrate, or president of the senate, was styled count, and afterwards rector, and was renewed every year. They also sent for a learned man from Greece, and made him, yielded; and through him they concluded a treaty with the emperor of Constantinople. They also made a treaty with the Sclavonian prince of Narenta, their immediate neighbour. This alliance with the Narentines, who were then very powerful by sea, continued until the latter part of the tenth century, when the emperor Basilius II. induced the Ragusans to forsake the alliance of the Narentines, who about the same time were defeated at sea by Pietro Orseolo, doge of Venice; after which the power of the Narentines dwindled away. The Ragusans now applied themselves assiduously to agriculture as well as to maritime trade; they built vessels, and became powerful by sea. Stephen, king of Dalmatia, gave them an increase of territory; and after his death, his widow Margaret, in consequence of some disturbances which broke out in her country, retired to Ragusa with her daughter, and became a nun. Bodislav, king of Croatia, a relative of Margaret, came with an army to besiege Ragusa, but was obliged to retire after devastating the territory. The Saracens from Africa also devastated the Illyrian coast; they took Aecivium, Rosson, and other places, and attacked Ragusa; but the emperor of Constantinople having sent an armament into the Adriatic, the Saracens left that coast, and threw themselves upon the opposite shore of Italy, where a Ragusan squadron joined the Imperial fleet, and defeated the Saracens. The annals of Ragusa for several centuries after this event exhibit a succession of wars and treaties between the republic and the Sclavonian powers of Croatia, Servia, Bosnia, and Bulgaria, as well as with the emperors of Constantinople and the Norman kings of Sicily, throughout which the small community of Ragusa preserved its independence and extended its maritime trade. Unluckily the annals are obscure and confused, especially with regard to dates, as are all the records which we have of the various Sclavonian powers which succeeded each other from the seventh to the fourteenth century in the extensive regions between the Danube and the Adriatic. Ragusan galleys joined Robert Guiscard, the Norman conqueror of Sicily, against Alexius Comnenus in the expedition to Durazzo; but Manuel Comnenus, having detached the Ragusans from their Norman alliance, bestowed privileges on their merchants, made them citizens of Constantinople, and caused a certain number of young Ragusans to be educated at his expense. Nearly about the same time the Ragusans made a treaty of commerce with Ladislaus I., king of Hungary. They also enlarged their town by building up the slope of the mountain to the northward; and as a new influx of Sclavonian families came to settle among them, Sclavonian became the prevailing language, and the Roman (probably a corrupt Latin) became gradually disused. The town now assumed the name of Dubrovnik, which was derived from that of the site which was newly built upon; for until then Ragusa had retained the Roman language and customs and name, being originally descended from the Roman colony of Epidaurus. (Luccari, *Ristretto degli Annali di Ragusa*, b. i.)

About the year 1260 Damianus, of the family of Giuda, then one of the principal in Ragusa, having been rector for one year, succeeded, by his connections, wealth, and popularity, in being re-elected for the following year, at the expiration of which, being strong with the support of the lower orders and that of some of his fellow-patricians, he contrived to prevent the yearly meeting of the great council for the purpose of electing a new rector. He thus retained the supreme magistracy for another two years, when several of the patricians, growing impatient of his usurpation, assembled privately at the house of Pietro Benessa, Damianus' son-in-law, and resolved to get rid of him. As they could not effect this by their own strength, they agreed to call in the Venetians. Benessa repaired to Venice under pretence of commercial business, and having had interviews with the principal Venetian senators, it was agreed that Damianus should be driven away, but on the condition that Venice should in future appoint the rectors of Ragusa. The Venetians sent two galleys, ostensibly to convey ambassadors to Constantinople. On arriving at Ragusa, the ambassadors repaired to the residence of Damianus, and after being entertained by him, they prevailed upon him to accompany them on board. As soon as Damianus had entered the Venetian galley, he was seized and bound, and the galley set sail for Venice. Damianus was so enraged at this treatment, that he killed himself by beating his head against the boards of his cabin. From that time till 1358, Ragusa had Venetian rectors, who held office for two years each, and were taken from among the first patrician families of Venice. Resti gives a list of them. Ragusa however still continued to govern itself as an independent state, and to be administered according to its own laws.

About the year 1329 the Ragusans, in order to obtain freedom of trade with the territories of the Byzantine emperor, agreed to pay him a tribute of 500 ducats a year, in consequence of which the Ragusan traders were admitted into the ports of the empire on the same footing as native subjects. In 1333, Stephen, king of Bosnia, gave to Ragusa the almost uninhabited districts of Ponte and Stagno, in the peninsula of Sabioncello, and the Ragusans set about building a strong fortress at Stagno, which commands the isthmus, at the expense of 120,000 ducats. The lands were divided, three-fourths among the nobles and one-fourth among the citizens, and an officer, with the title of count, was appointed by Ragusa to govern the ceded district. In 1348 the great plague which ravaged Europe spread to Ragusa, where it carried off 173 nobles, 300 citizens, and about 7000 of the lower orders. On this occasion, King Stephen of Bosnia showed himself friendly to the Ragusans by giving them provisions and other assistance. About 1358, war having broken out between Venice and the king of Hungary, the Hungarians advanced as far as Mestre, and Venice was obliged to sue for peace, one of the conditions of which was that Ragusa should be restored to independence and should choose its own rectors. It was also determined that the rector should be renewed every six months. In gratitude for this, the Ragusans agreed to pay a tribute of 500 ducats yearly to the king of Hungary, and to hoist his flag on their ramparts by the side of that of the republic. In the great war between Genoa and Venice (A.D. 1378-80), the Ragusans sided with Genoa, and some of their galleys were at the battle of Chioggia. After the defeat of the Genoese, Venice sent a squadron against Ragusa, which applied to the king of Bosnia for assistance, by whose means they repulsed the Venetians, after which peace was made between Venice and Ragusa. About the year 1397 a new race of formidable invaders, the Ottomans, under Sultan Bayazid, having defeated Sigismund of Hungary at the great battle of Nicopolis, overran part of Bosnia, and spread alarm as far as Ragusa. About 1414 the Ragusans purchased peace with the Ottomans by paying an annual tribute of 500 ducats, which was afterwards gradually raised as the Turks drew nearer to Ragusa. In 1433 the Ragusans introduced the manufactory of woollens from Florence, which became their principal branch of internal industry. They also constructed an aqueduct to carry the spring water from the valley of Gionchetto to their town, at an expense of 12,000 ducats.

In 1440, George Despotus of Servia, being defeated by Amurath II., took refuge at Ragusa with his family and treasures, and was there protected against the threats of Amurath, and afterwards furnished with the means of proceeding to Hungary, where he joined the brave Hunyades. About 1450 the Turks overran part of Dalmatia and Albania. Bosnia however remained free, and was still a bulwark to Ragusa on the land side. The Ragusans purchased from several Bosnian lords the district of Ragusa Vecchia and Canale, which constitutes the eastern part of their territory, and distributed the land among their citizens. But in 1463-4 Mahomet II. conquered Bosnia also, and the Turks became immediate neighbours of Ragusa, and have been ever since. About 1471 they ravaged the eastern district, Canale, but Ragusa obtained a respite by raising the tribute to 5000 ducats. Mahomet's son, Bayazid II., showed himself favourably disposed towards the Ragusans, who sent envoys to congratulate him on his accession to the throne, with large presents both for the Sultan and for the chief officers of state, and from that time the Ragusans continued to send yearly envoys to Constantinople to pay tribute and to maintain a good understanding with the Porte. During the long wars of the sixteenth century, between Sultan Solyman and his son Selim on one side, and Venice and Spain and other Christian powers on the other, the Ragusans found it a most arduous task to preserve their neutrality, as the fleets of the belligerents came repeatedly off their coasts, and landed and plundered the territory without scruple. They were charged by the pope, Venice, and the emperor, with favouring the Turks, and by the Turks with being partial to their enemies, and this because they endeavoured to keep on good terms with both, supplied their respective shipping with provisions, and gave shelter to the fugitives of both parties. Charles V. pressed several of their galleys into his service, and confiscated several of their merchant vessels. When the Venetians, the pope's admiral, and Andrea Doria joined their fleets in the Adriatic, in 1538, against Barbarossa, it was seriously debated among the leaders whether they should not begin by attacking Ragusa and bringing it into subjection to Charles V.; but Andrea Doria opposed this measure, saying that he had come to fight the infidels, and not his brother Christians. (Razzi, *Storia di Raugia*, who lived in the same century.) The expedition against Castelnuovo and Cattaro was then resolved upon. After the taking of Castelnuovo the Spanish garrison which was left there made incursions into the neighbouring territory of Ragusa, plundering the people, violating the women, carrying off the young girls, and committing every kind of atrocity.

Upon this the Ragusans sent a learned monk to pope Paul III. at Rome, to justify their conduct and explain to him their critical situation, being in the jaws, as it were, of the dreaded Ottomans, with a scanty and rocky territory which did not afford them the means of subsistence. At last the pope promised to protect Ragusa. By means of envoys and of presents to the various powers, and by maintaining a most prudent conduct, the Ragusans managed to steer their little bark safely through that most stormy period. Ferdinand I. of Austria, brother of Charles V., claimed the annual tribute from Ragusa in his quality of king of Hungary, but the senate answered, that Hungary having been conquered by the Porte, the tribute was now claimed by the Sultan, and from that time Ragusa ceased to pay tribute to Hungary.

Ragusa was a city of refuge; emigrants from all parts found hospitality there; Christians flying from the Ottomans; Florentine patriots emigrating after the fall of their republic, among others Soderini, the exiled Gonfalonière of Florence; Italians from every part, men of learning, found there a good reception, Ragusa being still a half Italian city. Tommaso Chersa of Ragusa has written a notice of all the distinguished Tuscans who had been in various epochs settled at Ragusa, bishops, professors, men of letters, statesmen, &c. (*Degli Illustri Toscani stati in diversi tempi à Ragusa*, Padova, 1828.)

Ragusa was a sort of neutral ground, a stepping-stone between Christendom and Turkey, and much intercourse and correspondence were carried on throught it, which could not always be carried on direct with Constantinople. Sultan Selim II. used to say that he received more correct information through the merchants of Ragusa concerning what took place among the Christians in the West than from all his pashas and sandjacks. Envoys to the Porte, from France, Venice, and other Christian countries embarked in the ports of Italy, and, after a short navigation across the Adriatic, landed at Ragusa, where they were hospitably received, and from thence proceeded by land to Constantinople.

During the seventeenth and eighteenth centuries, after a better understanding had been established between the Porte and the Christian powers, Ragusa continued to enjoy her independence and neutral security, paying the accustomed tribute to the Sultan, who however did not interfere in her internal concerns, and no Turkish soldier was allowed to step within its boundaries. The Sultan's protection was of importance to Ragusa, by securing its flag from the attacks of the Barbary pirates. In this respect the Ragusan merchant-ships had the advantage over those of most states in the Mediterranean, and they acted as carriers in that sea between the Levant and the ports of western Europe, and realised considerable profits, especially in times of war. Respectable Ragusan mercantile houses were established in many of the seaport towns of the Mediterranean. The republic maintained a small fleet of galleys and other armed vessels for the protection of its coasts and its trade. In 1667 Ragusa was afflicted by a dreadful earthquake, which ruined the greater part of the town, and which furnished the subject of an elegant Latin poem by Stay, a native of Ragusa.

The inhabitants were divided into three orders, gentiluomini or patricians, popolani or citizens, and plebeians or lower orders. The gentiluomini consisted, in Razzi's time (sixteenth century), of twenty-nine houses, which were all that remained of one hundred and thirty-two houses, of which the patrician order of Ragusa had once consisted. Razzi gives a list of these twenty-nine houses, some of which were from Epidaurus, some from Cattaro and other places in Dalmatia and Albania, and others from Italy. These houses, most of which had branched out into several families, intermarried with one another only, or with noble families of other countries. In the second edition of Luccari's more recent work (*Ristretto degli Annali di Ragusa*, 1790) we find the houses increased to thirty-three. The men wore long cloaks, in the old Florentine fashion, and round caps after the Venetian fashion. The patricians had the government entirely in their hands; they were all members of the general council or legislature, which met on the 1st of December every year, and out of which the members of the senate or executive were chosen, and were renewed every year. The rector or chief magistrate was changed in latter times every month. The patricians did not follow any trade or profession, but lived either on their rents or on the interest of their capital, which they lent to traders, ship-owners, and manufacturers. The citizens were chiefly engaged either in maritime or in retail trade. There was a council called minor, consisting of eleven old councillors, five of whom formed a court for criminal matters, and the other six judged in civil suits. There was also a board called 'Consiglio dell' Arte della Lana,' which decided questions concerning the trade, and especially the woollen trade, which was the most important. A stipendiary guard, of one hundred Hungarian soldiers and a captain, was kept by the republic, besides which there was a guard of native militia. Razzi, a foreigner and a monk, says that the councillors generally administered justice strictly, especially in criminal matters, but that in civil suits they sometimes favoured those of their own order. Luccari, a Ragusan and a patrician, says nothing about this. Razzi chiefly complains of the forwardness and impertinence of the boys of the patrician order, who used to carry things with a high hand, and even beat the other boys in the streets, who did not dare to resent this treatment in public, but sometimes, he adds, when the latter met their assailants in bye places, they took full revenge, and nothing more was said about it. He also complains that the said boys, while attending sermon, especially during Lent, would make a great disturbance in church, 'but,' he adds feelingly, 'as they were mostly of patrician families we could not control them, and must bear it with patience.' It was a proverb at Ragusa, 'Dalle mosche di Zara, e dai putti di Raugia cara, libera nos, domine' (the Lord deliver us from the flies of Zara, and from the boys of our beloved Ragusa). But of the grown-up men he speaks with esteem, as steady, well behaved, just, and civil. The people in general were contented and thriving. The gentlewomen dressed mostly in black, with white veils thrown over their heads and shoulders, which covered their faces: unmarried ladies seldom appeared in the streets. The women of the other classes dressed in various colours, and went about with their faces uncovered.

The Ragusans from the beginning of their republic have belonged to the Western or Roman church. They were not very tolerant of the Greeks of the Eastern church, whom they considered as schismatics; and they drove them away from the territories which they acquired at different times. Luccari gives a list of the archbishops of Ragusa. Ragusa is now only a bishop's see, and its bishop is suffragan to the archbishop of Zara.

Ragusa had remained an independent state for more than a thousand years; it had stood the attacks of numerous barbarians; it had warded off the insidious approach of its formidable Ottoman neighbours; it remained as an advanced post of European civilization on the borders of wild Bosnia and fierce Albania; its independence and its flag were respected by all the states of Europe. Coeval with Venice, it fell soon after that republic. The French Revolution and the wars resulting from it destroyed its independence, as well as that of all the old republics of Europe. In 1806, France and Russia were quarrelling about the possession of the important district of Cattaro, one of the spoils of Venice, which was ceded to France by the treaty of Presburg between Austria and France. The Russians however from Corfu had been beforehand, and had taken possession of Cattaro, with the connivance of the Austrian local authorities and with the assistance of the Montenegrins. The French troops from Dalmatia could not reach Cattaro without crossing the neutral territory of Ragusa. 'The want of faith displayed in the affair of Cattaro gave occasion to another violation of faith concerning Ragusa

The soldiers of Napoleon, unable to occupy Cattaro, took military possession of Ragusa, in May, 1806, without any shadow of right, except the pretence of defending it from the incursions of the Montenegrins.' (Botta, *Storia d'Italia*, l. xxii.) But it was precisely the French occupation of Ragusa that led the Montenegrins to overrun its territory. They besieged the French within the town. The unfortunate Ragusans, placed between the regular French troops within and the savage Montenegrins without, saw their country-houses and villages devastated, but the town was saved from the Montenegrins. The result of this was, that Napoleon, by a stroke of the pen, in 1808, abolished the republican government, and incorporated Ragusa with the province of Dalmatia, and he made Marmont titular duke of Ragusa and governor of the province. Thus ended the independence of Ragusa, in the same manner and nearly about the same time as that of Genoa, Venice, Lucca, Geneva, Hamburg, and the other free towns of Germany. On the fall of Napoleon in 1814, when the Austrians again occupied Dalmatia, they found Ragusa included in that province, and they kept it, and it has ever since formed part of the Austrian territories. A good map of Dalmatia, including the territory of Ragusa, was published at Vienna in 1810: '*Carte* von Dalmatien und dem Gebiete von Ragusa,' by Max. de Traux.
